

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 418. NEW SERIES.

SATURDAY, JANUARY 3, 1852.

PRICE 1½d.

A CHILD'S TOY.

THE afternoon was drawing in towards evening; the air was crisp and cool, and the wind near the earth, steady but gentle; while above all was as calm as sleep, and the pale clouds—just beginning in the west to be softly gilded by the declining sun—hung light and motionless. The city, although not distant, was no longer visible, being hidden by one of the many hills which give such enchantment to the aspect of our city. There was altogether something singularly soothing in the scene—something that disposed not to gravity, but to elevated thought. As we looked upwards, there was some object that appeared to mingle with the clouds, to form a part of their company, to linger, mute and motionless like them, in that breathless blue, as if feeling the influence of the hour. It was not a white-winged bird that had stolen away to muse in the solitudes of air: it was nothing more than a paper kite.

On that paper kite we looked long and intently. It was the moral of the picture; it appeared to gather in to itself the sympathies of the whole beautiful world; and as it hung there, herding with the things of heaven, our spirit seemed to ascend and perch upon its pale bosom like a wearied dove. Presently we knew the nature of the influence it exercised upon our imagination; for a cord, not visible at first to the external organs, though doubtless felt by the inner sense, connected it with the earth of which we were a denizen. We knew not by what hand the cord was held so steadily. Perhaps by some silent boy, lying prone on the sward behind yonder plantation, gazing up along the delicate ladder, and seeing unconsciously angels ascending and descending. When we had looked our fill, we went slowly and thoughtfully home along the deserted road, and nestled as usual, like a moth, among our books. A dictionary was lying near; and with a languid curiosity to know what was said of the object that had interested us so much, we turned to the word, and read the following definition: Kite—a *child's toy*.

What wonderful children there are in this world, to be sure! Look at that American boy, with his kite on his shoulder, walking in a field near Philadelphia. He is going to have a fly; and it is famous weather for the sport, for it is in June—June 1752. The kite is but a rough one, for Ben has made it himself, out of a silk-handkerchief stretched over two cross-sticks. Up it goes, however, bound direct for a thunder-cloud passing overhead; and when it has arrived at the object of its visit, the flier ties a key to the end of his string, and then fastens it with some silk to a post. By and by he sees some loose threads of the hempen-string bristle out and stand up, as if they had been charged with

electricity. He instantly applies his knuckle to the key, and as he draws from it the electrical spark, this strange little boy is struck through the very heart with an agony of joy. His labouring chest relieves itself with a deep sigh, and he feels that he could be contented to die that moment. And indeed he was nearer death than he supposed; for as the string was sprinkled with rain, it became a better conductor, and gave out its electricity more copiously; and if it had been wholly wet, the experimenter might have been killed upon the spot. So much for *this child's toy*. The splendid discovery it made—of the identity of lightning and electricity—was not allowed to rest by Ben Franklin. By means of an insulated iron rod the new Prometheus drew down fire from heaven, and experimented with it at leisure in his own house. He then turned the miracle to a practical account, constructing a pointed metallic rod to protect houses from thunder. One end of this true magic wand is higher than the building, and the other end buried in the ground; and the submissive lightning, instead of destroying life and property in its gambols, darts direct along the conductor into the earth. We may add that Ben was a humorous boy, and played at various things as well as kite-flying. Hear this description of his pranks at an intended pleasure-party on the banks of the Skuyll-kill: 'Spirits at the same time are to be fired by a spark sent from side to side through the river, without any other conductor than water—an experiment which we have some time since performed to the amazement of many. A turkey is to be killed for dinner by the electrical shock; and roasted by the electrical jack, before a fire kindled by the electric bottle; when the healths of all the famous electricians in England, Holland, France, and Germany, are to be drunk in electrified bumpers, under the discharge of guns from the electrical battery.'

We now turn to a group of capital little fellows who did something more than fly their kite. These were English skippers, promoted somehow to the command of vessels before they had arrived at years of discretion; and, chancing to meet at the port of Alexandria in Egypt, they took it into their heads—these naughty boys—that they would drink a bowl of punch on the top of Pompey's Pillar. This pillar had often served them for a signal at sea. It was composed of red granite, beautifully polished, and standing 114 feet high, overtopped the town. But how to get up? They sent for a kite, to be sure; and the men, women, and children of Alexandria, wondering what they were going to do with it, followed the toy in crowds. The kite was flown over the Pillar, and with such nicety, that when it fell on the other side the string lodged

upon the beautiful Corinthian capital. By this means they were able to draw over the Pillar a two-inch rope, by which one of the youngsters 'swarmed' to the top. The rope was now in a very little while converted into a sort of rude shroud, and the rest of the party followed, and actually drank their punch on a spot which, seen from the surface of the earth, did not appear to be capable of holding more than one man.

By means of this exploit it was ascertained that a statue had once stood upon the column—and a statue of colossal dimensions it must have been to be properly seen at such a height. But for the rest—if we except the carving of sundry initials on the top—the result was only the knocking down of one of the volutes of the capital, for boys are always doing mischief; and this was carried to England by one of the skippers, in order to execute the commission of a lady, who, with the true iconoclasm of her country, had asked him to be so kind as to bring her a piece of Pompey's Pillar.

Little fellows, especially of the class of bricklayers, are no great readers, otherwise we might suspect that the feat of the skipper-boys had conveyed some inspiration to Steeple Jack. Who is Steeple Jack? asks some innocent reader at the Antipodes. He is a little spare creature who flies his kite over steeples when there is anything to do to them, and lodging a cord on the apex, contrives by its means to reach the top without the trouble of scaffolding. No fragility, no displacement of stones, no leaning from the perpendicular, frightens Steeple Jack. He is as bold as his namesake Jack-the-Giant-Killer, and does as wonderful things. At Dunfermline, not long ago, when the top of the spire was in so crazy a state that the people in the street gave it a wide berth as they passed, he swung himself up without hesitation, and set everything to rights. At the moment we write his cord is seen stretched from the tall, slim, and elegant spire of the Assembly Hall in Edinburgh, which is to receive through his agency a lightning-conductor; and Jack only waits the subsidence of a gale of wind to glide up that filmy rope like a spider. He is altogether a strange boy, Steeple Jack. Nobody knows where he roosts upon the earth, if he roosts anywhere at all. The last time there was occasion for his services, this advertisement appeared in the *Scotsman*: 'Steeple Jack is wanted at such a place immediately'—and immediately Steeple Jack became visible.

In 1827 the child's toy was put to a very remarkable use by one Master George Pocock. This clever little fellow observed that his kite sometimes gave him a very strong pull, and it occurred to him that if made large enough it might be able to pull something else. In fact, he at length yoked a pair of large kites to a carriage, and travelled in it from Bristol to London, distancing in grand style every other conveyance on the road. A twelve-foot kite, it appears, in a moderate breeze, has a one-man power of draught, and when the wind is brisker, a force equal to 200 lbs. The force in a rather high wind is as the squares of the lengths; and two kites of fifteen and twelve feet respectively, fastened one above the other, will draw a carriage and four or five passengers at the rate of twenty miles an hour. But George's invention went beyond the simple idea. He had an extra line which enabled him to vary the angle of the surface of his kites with the horizon, so as to make his aerial horses go fast or slow as he chose; and side-lines to vary the direction of the force, till it came

almost to right angles with the direction of the wind. His kites were made of varnished linen, and might be folded up into small compass. The same principle was successfully applied by a nautical lad of the name of Dansey to the purpose of saving vessels in a gale of wind on 'the dread lee-shore.' His kite was of light canvas.

In India, China, and the intermediate countries, the aggregate population of which includes one-half of mankind, kites are the favourite toy of both old and young boys, from three years to threescore and ten. Sometimes they really resemble the conventional dragon, from which, among Scotch children, they derive their name; sometimes they are of a diamond shape, and sometimes they are like a great spider with a narrow waist. Our Old Indian is eloquent on kites, and the glory of their colours, which, in the days of other years, made her girlish heart leap, and her girlish eyes dazzle. The kite-shop is like a tulip-bed, full of all sorts of gay and gorgeous hues. The kites are made of Chinese paper, thin and tough, and the ribs of finely-split bamboo. A wild species of silkworm is pressed into the service, and set to spin *nuck* for the strings—a kind of thread which, although fine, is surprisingly strong. Its strength, however, is wanted for aggression as well as endurance; and a mixture composed of pounded glass and rice gluten is rubbed over it. Having been dried in the sun, the prepared string is now wound upon a handsome reel of split bamboo inserted in a long handle. One of these reels, if of first-rate manufacture, costs a shilling, although coarser ones are very cheap; and of the *nuck*, about four annas, or sixpence worth, suffices for a kite.

In a Hindoo town the kite-flying usually takes place on some common ground in the vicinity, and there may be seen the young and old boys in eager groups, and all as much interested in the sport as if their lives depended upon their success. And sometimes, indeed, their fortunes do. Many a poor little fellow bets sweetmeats upon his kite to the extent of his only anna in the world; and many a rich baboo has more rupees at stake than he can conveniently spare. But the exhilarating sport makes everybody courageous; and the glowing colours of the kites enable each to identify his own when in the air, and give him in it, as it were, a more absolute property. Matches are soon made. Up go the aerial combatants, and with straining eyes and beating hearts their fate is watched from below. But their masters are far from passive, for this is no game of chance, depending upon the wind. Kite-flying is in these countries an art and mystery; and some there be who would not disclose their recipe for the *nuck*-ointment, if their own grandfathers should go upon their knees to ask it.

Sometimes an event occurs on the common. It is the ascent of a pair of kites of a *distingué* air, and whose grand and determined manner shews that the combat is to be à l'oustrance, and that a large stake of money depends upon the result. The fliers are invisible. They are probably on the flat roof of some neighbouring house; but the kites are not the less interesting on account of their origin being unknown. What a host of anxious faces are turned up to the sky! Some take a liking to the red at first sight, while others feel attracted by a mysterious sympathy to the green. Bets are freely offered and accepted either in sweetmeats or money; and the crowd, condensing, move to

and fro in a huge wave, from which their eager voices arise like the continuous roaring of the sea. Higher and higher go the kites. Well done, Red! he has shot above his antagonist, and seems meditating a swoop; but the Green, serenely scornful, continues to soar, and is soon uppermost. And thus they go—now up, now down, relatively to each other, but always ascending higher and higher, till the spectators almost fear that they will vanish out of sight. But at length the Green, taking advantage of a loftier position he has gained, makes a sudden circuit, and by an adroit manœuvre gets his silken string over the silken string of the other. Here a shout of triumph and a yell of terror break simultaneously from the crowd; for this is the crisis of the fight. The victor gives a fierce cut upon his adversary's line. The backers of the latter fancy they hear it grate, and in an instant their forebodings are realised; for the unfortunate Red is seen to waver like a bird struck by a shot, and then, released from the severed string, he descends in forlorn gyrations to the earth.

Now rush in the smaller boys to play their part. Their object is that of the plunderers who traverse the field after a battle, to rob the dying and the slain. Off run the little Hindoos, like a company of imps from the nether regions, tearing and fighting as they fly; and on reaching the fallen kite, the object of their contention is torn to pieces in the scuffle. Presently the victorious Green is seen descending, and the gross excitement of the common pauses to watch his majestic flight. He is of the largest size of Indian kites called *ching*, and of the spider shape. Before being drawn in, he hangs for an instant high up over the crowd. It is not, however, to sing *Io Peans* for his victory, but apparently rather to mourn over the ruin he has made; for a wailing music breathes from his wings as he passes. This is caused by the action of the wind upon some finely-split bamboo twigs arched over the kite without touching the paper, and which thus become a true *Æolian harp*. Sometimes a kite of this kind is sent up at night, bearing a small lighted lantern of talc; and the sleepers awakened, called to their balconies by the unearthly music, gaze after the familiar apparition not without a poetical thrill.

Upon the whole, it must be admitted, we think, that this is a somewhat interesting child's toy. But has the kite a future? Will its powers exhibit new developments, or has it already reached its pride of place? If a twelve-foot kite has the force of a man, would it take many more feet to lift a man into the air? And supposing the man to be in a strong cage of network, with bamboo ribs, and a seat of the same material, would he have greater difficulty in governing his aerial couriers by means of the Pockock cords, than if he were *flashing* along the road from Bristol to London? Mind, we do not say that this is possible: we merely ask for the sake of information; and if any little boy will favour us with his opinion, we shall take it very kind. Come and let us fancy that it is possible. The traveller feels much more comfortable than in the car of a balloon, for he knows he can go pretty nearly in what direction he chooses, and that he can hasten or check the pace of his horses, and bring them to a stand-still at pleasure. See him, therefore, boldly careering through the air at the rate of any number of miles the wind pleases. At a single bound he spans yonder broad river, and then goes bowling over the plantation beyond, just stirring the leaves as he passes; trees, water, houses, men, and animals gliding away beneath his feet like a dream. Now he stoops towards the earth, just to make the people send up their voices that there may be some

sound in the desert air. Now he swings up again; now he leaps over that little green hill; now he—Hold! hold, little boy!—that will do; enough for a time of a Child's Toy.

JAMES FENIMORE COOPER.

'... Whose trained eye was keen,
As eagle of the wilderness, to scan
His path by mountain, lake, or deep ravine,
Or ken far friendly huts on good savannas green.'

—CAMPBELL: *Gertrude of Wyoming*.

On the 14th of last September, America lost the greatest of her novelists in the person of James Fenimore Cooper. He was born on the 15th of that month, 1789; so that, had he lived but a few hours longer, he would have completed his sixty-second year. At the time of his birth, his father, Judge Cooper, resided at Burlington, New Jersey, where the future *littérateur* commenced his education, and in so doing acquired a decided reputation for talent, which was not tarnished during subsequent years of tutelage at New-haven and Yale College. At sixteen he exchanged the study of ancient literature and the repose of academic life for the bustling career of a 'middy' in the American navy; continuing for some half-dozen years his connection with those ocean scenes which he then learned to love so well and to describe so vividly. His retirement into private life took place in 1811, soon after which he married Miss de Lancey (whose brother is known to many as one of the New York bishops), and settled at Cooper's Town, his patrimonial estate. Ten years elapsed before his *début* as an author. In 1821 he presented the public with a novel bearing the perhaps apposite title of *Precaution*—apposite, if the two *lustra* thus elapsed were passed in preparation for that *début*, and as being after all anonymously published. The subject was one with which Cooper never shewed himself conversant—namely, the household life of England. Like his latest works, *Precaution* was a failure, and gave scanty indications of that genius which was to find its true sphere and full scope in the trackless prairies of his native land, and its path upon the mountain-wave he had ridden in buoyant youth. But the same year produced *The Spy*, still considered by many to be his masterpiece, and from that production his fame was secure; and not only America but British voices, exhorted Sir Walter to look to his laurels. Certainly there was a little more reason in calling Cooper the American Scott than in pronouncing Klopstock the German Milton.

The successful novelist visited Europe a few years after this 'sign and seal' of his literary renown, and spent a considerable period among the principalities and powers of Old-World Christendom. In Paris and London especially he was lionised to the top of his bent. Sir Walter met him in the French metropolis in 1826; and in his diary of November 8, after recording a morning visit to 'Cooper the American novelist,' adds: 'this man, who has shewn so much genius, has a good deal of the manners or want of manners peculiar to his countrymen.' Three days later we find the following entry: 'Cooper came to breakfast, but we were *obsides partout*. Such a number of Frenchmen bounced in successively, and exploded—I mean discharged—their compliments, that I could hardly find an opportunity to speak a word or entertain Mr Cooper at all.* The 'illustrious stranger' appears to have spent about ten years in Europe, for which he was, perhaps, in a literary point of view, none the better; as—to use the words of a periodical of the day—'he did not carry back the same fresh spirit that he brought, something of which must be attributed, no doubt, to the years which intervened;

* Lockhart's Life of Scott.

but something, too, to his abandonment of that mother-ground which to him, as to the fabled Antæus, was the source of strength.' The autumn of his life glided quietly on amid the pleasures and pains of literature; its sombre close being pleasantly illuminated by the rays of spring-promise that radiated around the young brow of his daughter, which the dying veteran might well hope would be matured into 'glorious summer by the sun of' time. *Valeat signum!*

In calling Cooper the greatest of American novelists, we have not incurred much risk of contradiction. Others may rival—some surpass him—in this or that province of the art of fiction; but as a master of the art in its broad aspect, he is *facile princeps*. Brockden Brown treads a circle of mysterious power but mean circumference: Washington Irving is admirable at a sketch, one of the liveliest and most graceful of essayists, and quite equal to the higher demands of imaginative prose—witness his *Rip Van Winkle* and *Sleepy Hollow*—but his forte is in miniature, and the orthodox dimensions of three volumes post-octavo would suit him almost as ill as would the Athenian vesture of Nick Bottom the spruce proportions of royal Oberon: Haliburton is inimitable in his own line of things; his measure of wit and humour—qualities unknown, or nearly so, to Cooper—is 'pressed down, and shaken together, and running over;' but his 'mission' and Cooper's in the tale-telling art are wide as the poles asunder: John Neale had once, particularly by his own appraisal, a high repute as the eccentric author of *Logan* and *Seventy-six*, but the repute, like the *Seventy-six*, is quite in the preterite tense now; and to review him and his works at this time of day would be suspiciously like a *post-mortem* examination, resulting possibly in a verdict of temporary insanity—if not, indeed, of *felo de se*—so wilful and wrongheaded were the vagaries of this 'rough, egotistical Yankee,' as he has been called: Herman Melville is replete with graphic power, and riots in the exuberance of a fresh, racy style; but whether he can sustain the 'burden and heat' of a well-equipped and full-grown novel as deftly as the fragmentary autobiographies he loves to indite, remains to be seen: Longfellow's celebrity in fiction is limited to *Hyperion* and *Kavanagh*—clever, but slight foundations for enduring popularity—as irregular (the former at least) as Jean Paul's nondescript stories, without the great German's tumultuous genius: Hawthorne is probably the most noteworthy of the rising authors of America, and indeed manifests a degree of psychological knowledge and far-sighted, deep-searching observation of which there are few traces or none in Cooper; but the real prowess of the author of *The Scarlet Letter* is, we apprehend, still undeveloped, and the harvest of his honours a thing of the future. All these distinguished persons—not to dwell on the kindred names of Bird, Kennedy, Ware, Paulding, Myers, Willis, Poe, Sedgwick, &c.—must yield the palm to him who has attracted all the peoples and tongues of Europe* to follow out the destiny of a Spy on the neutral ground, of a Pilot on the perilous coasts of a hostile race, of a Last of the Mohicans disappearing before the onward tramp of the white man. As Rob Roy felt the pulses of life quickened when his foot was on his native heath, so Cooper wrote with vigour and aplomb only when his themes were the aboriginal forest and the melancholy main. Pity that, having discovered the fount of his strength—the Samson-lock by which alone he towered above his fellows—he had not restrained himself, and concentrated his efforts within the appointed sphere. He repudiated the oracular counsel which his own consciousness must have approved—*Hoc signo vinces*; and

seemed to assume that whatever province he invaded, the bulletin of the campaign would be another *Veni, vidi, vici*. Few things can be more unsatisfactory and insipid than his attempts in the 'silver-fork school' of novel-writing—his dreary commonplaces of fashionable life—his faded sermonisings on domestic, and political, and social economy. Few things can be more inspiring, more energetic, more impressive, than his pictures of

'A wet sheet and a flowing sea,
A wind that follows fast,
And fills the white and rustling sail,
And bends the gallant mast;'

for we see in every stroke that the world of waters is his home, and that to his ear there is music in the wild piping of the wind, and that his eye beams afresh when it descries tempest in the horned moon, and lightning in the cloud. To him the ocean is indeed 'a glorious mirror,' where the form of the Highest 'glasses itself in tempests;' dear to him it is

— 'in all time,
Calm or convulsed—in breeze, or gale, or storm;
..... Boundless, endless, and sublime—
The image of Eternity—the throne
Of the Invisible.'

Well might one who had lived six years on her swelling bosom, combine with his love 'of the old sea some reverential fear,' as Wordsworth has it. This compound feeling is highly effective in his marine fictions, so instinct is it with the reality of personal experience. Mr Griewold tells us that Cooper informed him as follows of the origin of *The Pilot*: 'Talking with the late Charles Wilkes of New York, a man of taste and judgment, our author [Cooper] heard extolled the universal knowledge of Scott, and the sea-ports of *The Pirate* cited as a proof. He laughed at the idea, as most seamen would, and the discussion ended by his promising to write a sea-story which could be read by landmen, while seamen should feel its truth. *The Pilot* was the result of that conversation.* Of this tale Scott says, in a letter to Miss Edgeworth: 'I have seen a new work, *The Pilot*, by the author of *The Spy* and *The Pioneers*. The hero is the celebrated Paul Jones, whom I well remember advancing above the island of Inchkeith, with three small vessels, to lay Leith under contribution. The novel is a very clever one, and the sea-scenes and characters in particular are admirably drawn; and I advise you to read it as soon as possible.' Still higher panegyric would not have been misbestowed in this instance, which illustrates Mr Prescott's remark, that Cooper's descriptions of inanimate nature, no less than of savage man, are alive with the breath of poetry—'Witness his infinitely various pictures of the ocean; or, still more, of the beautiful spirit that rides upon its bosom, the gallant ship.' Though it is to *The Pilot*, pre-eminently, and *The Waterwitch*, in nearly an equal degree, that these remarks apply, there is many a passage in Cooper's later novels—for example, *The Two Admirals*, *Homeward Bound*, *Mark's Reef*, *Afloat*, and *The Sea-Lions*—in which we recognise the same 'cunning' right hand which pencilled the *Ariel* and its crew, the moody, mysterious pilot, and stalwart Long Tom Coffin.

Nor was he less at home in the backwoods and prairies of his fatherland, than upon the broad seas which divide it from the Old World. Tastes differ; and there are those—possibly the majority of his readers—who prefer the Indian associations of *The Last of the Mohicans*, *The Pioneers*, &c. to the salt-water scenery of the other class of works. For our part, we prefer his prairies to his savages, his forests to his

* And, in one instance at least, of Asia also; for *The Spy* was translated into Persian!

* 'The Prose-Writers of America.'

aborigines, his inanimate to his living sketches of Indian story. His wild men of the woods are often too sentimental, too dreamy, too ideal. In this respect Brockden Brown has the advantage of him; for, as Mr Prescott has pointed out, Brown shews the rude and uncouth lineaments of the Indian character, though he is chargeable with withholding intimations of a more generous nature, while Cooper discards all the coarser elements of savage life, and idealises the portrait. The first of this series of tales of

‘Painted chiefs with pointed spears,’

was *The Pioneers*—the materials for which, it seems, were to a considerable extent derived from his father, ‘who had an interest in large tracts of land near the sources of the Susquehanna,’ where the scene is laid, and allied, therefore, to Campbell’s *Gertrude of Wyoming*. It was speedily followed by *The Last of the Mohicans*—not uncommonly pronounced his *chef-d’œuvre*—and *The Prairie*; which, among numerous descriptions of absorbing interest, pervaded throughout by a fine imaginative spirit, contains one of thrilling power—where the squatter discovers and avenges the murder of his son. *The Wept of Wish-ton-Wish*—a strange story with a strange title, and which forms (chronologically at least) the climax of Cooper’s fame—is justly admired by all who appreciate ‘minute painting,’ and that pensive monotony which begets a certain ‘melancholy charm.’ His skill in martial narrative was favourably attested in *Lionel Lincoln*; in which he describes with remarkable spirit and equal accuracy the battles of Lexington and of Bunker’s Hill. But to go through in detail the *opera omnia* of our prolific author would involve us in difficulties with editor and reader too serious to bear anticipation. Passing over, therefore, such of his earlier writings as are better known—like *The Red Rover*, *The Water-witch*, *The Pathfinder*, and *The Deerslayer*—we proceed to notice briefly a select few from the long series produced during the last ten years.

The Two Admirals is of unequal interest—the twin heroes, Sir Gervaise Oakes and Bluewater, engrossing whatever charm it possesses, and reacting disastrously on the tedious scenes wherein they bear no part; but they certainly do walk and talk like sound-hearted sons of Neptune, and there is no resisting the spell of the battle and the breeze which they encounter together, in the *Plantagenet* and the *Cæsar*. *The Jack o’ Lantern, or the Privateer*, was put forth with an expression of the author’s conviction that his faculty in this class of fictions was inexhaustible; to which, however, the critics demurred. One of them observed that, following out the fantastical supposition which ascribes especial virtues to certain numbers, or even working out the analogy of the seventh wave, which sea-shore gossips tell us is surpler and stronger than its predecessors, the seventh sea-novel of Mr Cooper’s ought to be the most remarkable of the series for force, brilliancy, and movement. But such symbolism was here found defective: the seventh wave broke abruptly on the shore; the Jack o’ Lantern’s existence has been brief and uncertain as that of the *ignis fatuus* on the marsh. The story introduces Caraccioli and the Neapolitan court, Nelson and Lady Hamilton; but without striking points. There are some cleverly-drawn characters, however: Clinch, the drunken but winning British tar; Raoul Yvard, brilliant, handsome, and Parisian all over, philosophism included; and Ithuel Bolt, a new (not improved) edition of Long Tom. The plot is ingenious, though perhaps constrained and far-fetched; and its *dénouement* makes the reader put down the third volume with increased respect for the novelist’s tact. *Wyandotté, or the Hatted Knoll* (1848), is a quiet yet animated narrative, descriptive of a family of British settlers and their fortunes in their wild Susquehanna home.

There is a pleasure, the author observes, in diving into a virgin forest, and commencing the labours of civilisation, that has no exact parallel in any other human occupation; and some refracted share of this pleasure is secured by every intelligent reader while engaged in perusing records so faithful and characteristic as those embodied in this tale. *Ravensnest*, with no lack of scenic embellishments, introduces to us three of the author’s happiest characters—always excepting Leatherstocking and Long Tom—namely, the two Littlepages, ‘Captain Hugh’ and his ‘Uncle Ro,’ and Mistress Opportunity Newcome. The didactic asperities in which he indulged naturally marred the fortune of a book whose readers, whatever they might be, were pretty safely ‘booked’ for a scolding. Otherwise, it gleamed with scintillations, neither faint nor few, of the light of other days. But it was evident that Mr Cooper was overwriting himself. He seemed determined not to be outdone in fecundity by the most prolific of his contemporaries—as though it were a safe speculation or a healthy emulation to run against such light horsemen and horsewomen as Mr James and M. Dumas, and Mesdames Gore and Trollope. Hence he might have appropriately echoed the complaint of the slave in Terence:

‘Parum succedit quod ago, at facio sedulò.’

In 1847, he produced *Mark’s Reef*, a story of the Crusoe genus, but far behind; the desert island being created ‘positively for this occasion only,’ and being swallowed up in the sea again when it has served Mark Woolston and the novelist’s requirements. It is characterised, however, by much glowing description—especially that relating to the crater, with its noble peak, ‘ever the same amid the changes of time, and civilisation, and decay; naked, storm-beaten, and familiar to the eye.’ The following year he was ready with *The Bee-Hunter*, wherein he sought to revive his pristine successes among American solitudes and Red Indians. Again we hear the palaver of the stately and sentimental Chippewas; and again we watch, with sadly-relaxed attention, the dodging extraordinary of Pale Faces and Red Men. Alas!

‘Both of them speak of something that is gone : . .

Whither is fled the visionary gleam!

Where is it now, the glory and the dream!’

The Indians have become comparatively seedy and second-hand individuals; the scenery, with occasional exceptions, looks worn; the machinery creaks and betrays itself, no longer possessing the *ars celare artem*. ‘Tis true, ‘tis pity; pity ‘tis, ‘tis true.’ One novelty, nevertheless, this tale can boast, and that is the very able and interesting sketch of the bee-hunter following his vocation in the ‘oak-openings;’ nor is the portrait of Buzzing Ben himself an ordinary daub. In 1849 appeared *The Sea-Lions*, a clever but often prolix work, which ought to keep up its interest with the public, if only for its elaborate painting of scenes to which the protracted mystery of Sir John Franklin’s expedition has imparted a melancholy charm. The sufferings of sealers and grasping adventurers among ‘thrilling regions of thick-ribbed ice’ are recounted with dramatic earnestness. *The Ways of the Hour* was both ‘nominally’ and ‘really’ Cooper’s last novel: he announced it as such; and the announcement was not related to that fallacious category to which belong the ‘more last nights’ of popular tragedians, and the farewell prefaces of the accomplished author of *Rienzi*. It was not the ‘going, going!’ but the ‘gone!’ of the auctioneer. And critics maliciously said: *Tant mieux*. In *The Ways of the Hour* there was one vigorous portrait, Mary Monson, and several ‘moving accidents by flood and field:’ but with these positive qualities the reader had to accept an unlimited stock of negatives.

Besides the works thus referred to, Cooper wrote at short intervals a 'serried phalanx' of others, from the ranks of which suffice it to name *The Heidenmauer*, *The Bravo*, *The Monikins* (a weak and injudicious tale, quite unworthy of his honourable reputation), *The Headsman of Berne*, *Mercedes of Castilla*, *Satanstoe*, *Home as Found*, *Ashore and Afloat*. In miscellaneous literature his writings include a *History of the Navy of the United States*, *Lives of Distinguished Naval Officers*, *Sketches of Switzerland*, *Gleanings in Europe*, and *Notions of the Americans*.

It is by his early tales of wilderness and ocean life that he will survive. There his genius is fresh, vigorous, natural—uncramped by restraints, undeformed by excrescences, uninterrupted by crotchets, such as injured its aftergrowth—the swaddling-clothes of its second childhood. If we have spoken freely—we hope not flippantly—of these feeblenesses, it is because the renown of Cooper is too tenaciously and permanently rooted to be 'radically' affected thereby, however they may diminish the symmetry and dim the verdure of blossom and branch. His magnificent panoramas of prairie solitude, his billowy expanses of the 'many-voiced sea,' his artistically-grouped figures of red-skins and trappers, sealers and squatters, are among the things which Anglo-Saxon literature in either hemisphere will not willingly let die. By these he is, and long will be, known and read of all men. And if ever Mr Macaulay's New Zealander should ponder over the ruins of Broadway, as well as of St Paul's, he will probably carry in his pocket one of those romances which tell how the Last of the Mohicans came to his end, and which illustrate the closing destinies of tribes which shall then have disappeared before the chill advance of the Pale Face.

WHY DOES THE PENDULUM SWING?

THE attention of the visitor to the recent Exhibition in Hyde Park was arrested, as he advanced westwards down the central promenade of the building, by a large clock busily at work marking off the seconds of passing time. That piece of mechanism had a remarkably independent and honest look of its own. The inmost recesses of its breast were freely bared to the inspection of every passer-by. As if aware of the importance of the work intrusted to its care, it went on telling, in the midst of the ever-changing and bustling crowd, with a bold and unhesitating click, the simple fact it knew; and that there might be no mistake, it registered what it told in palpable signs transmitted through the features of its own stolid face. Mr Dent's great clock was by no means the least distinguished object in the collection of the world's notabilities.

But there was one thing which nearly concerned that industrious and trusty monitor that he surely could not have known, or his quiet countenance would have shewn traces of perturbation. He was doing Exhibition work, but he was not keeping Exhibition time. The wonderful building in which he had taken up his temporary residence was, in fact, of too cosmopolitan a nature to have a time of its own. Its entire length measured off very nearly 1-42,000th part of the circle of terrestrial latitude along which it stretched. The meridian of the Liverpool Model was close upon thirty seconds of space farther west than the meridian of the Greek Slave. Imagine the surface of Hyde Park to have been marked off, before Messrs Fox and Henderson's workmen commenced their labours, by lines running north and south at the equal distance of a second of a degree from each other, just as one sees the surface of large maps traced by meridians, nearly thirty of those lines would then have been covered in by the east and west span of the crystal roof. Mr Dent's clock might have been set to the precise time of the Greek Slave, and it would yet have

been nearly two seconds wrong by the time of the Liverpool Model. The pendulum swinging so steadily within its case had a longer and more stately stride than most of its congeners. It took a second and a half of time to complete its step from side to side. But notwithstanding this, if a string had been suddenly stretched across in space above the east end of the building, and left there in free suspension, independent of all connection with the terrestrial surface, it would have taken longer for the huge structure to be trailed beneath it by the earth's rotation—swift as that rotation is—than it did for the sober and leisurely mass of metal to finish its beat from side to side.

Our immediate business, however, at this present time is not with the geographical relations of Mr Paxton's building, but rather with that sober and leisurely-moving mass—the pendulum. Even in the seventeenth century, old Graunt was shocked when some irreverent babbler spoke of one of its honourable race by the rude epithet of 'a swing-swang;' and he penned an indignant protest on the subject to the Royal Society. Since that time the pendulum has done much more to merit the reverence of the world. Plain and simple as its outward bearing is, it really holds a high and dignified position in the annals of science.

Instead, however, of touching upon its pedigree and achievements, we proceed at once to speak of certain interesting peculiarities that enter as an element into all considerations in which it has concern. In the first place, what is that characteristic motion which it so constantly assumes—that restless swinging from side to side? Is it a property inherent in its own nature, or is it a power communicated to it from without? There is a train of wheelwork enclosed with it in the case. Is that the source of its vibratile mobility? Assuredly not. For if we arrest its motion with our hand at the instant that its form hangs perpendicularly suspended, that motion is not renewed although the wheels remain in unaltered relation. Those mechanical contrivances clearly do not comprise the secret of its swinging. We must look elsewhere if we would ascertain the fundamental cause.

Has the reader ever looked at the plain white building, with successive rows of little windows, which so often spans the breadth of our smaller streams? If he has, the thought has at once arisen that within those walls huge wheels and heavy-revolving stones remorselessly tear and crush to powder heaps upon heaps of yellow grain, with a power that is equal to the combined effort of a whole troop of horses concentrated in the task. But we question very much whether he has as clearly seen whence those clattering wheels derive their many horse-power! If we were to ask him to tell us how they acquired their rolling strength, he would most probably answer—from the current of the stream. This reply would amount to nothing in the matter of explanation; the force of the current is as much a borrowed attribute as the force of the wheelwork. The running water is no more an independent and living agent than is the machinery which it turns. Beyond both is the one grand determining influence—the attractive energy inherent in the substance of the vast earth. This it is which makes the water run; this it is which enables the running water to move the wheelwork inserted into its channel. As the magnet draws to itself the fragment of steel, the earth draws to itself all ponderable matter; and whenever ponderable matter is free to move, it rushes as far as it can go towards the centre of the earth's substance, in obedience to the summons. Mobile water runs down from a higher to a lower level because the latter is nearer to the earth's centre than the former, and as it falls it pushes before it such minor obstructions as are unable to resist the influence of its weight. The float-boards of the mill-wheel are of this nature; they are striving to uphold the water

by means of the rubbing and friction of the apparatus that is mechanically connected with the axle. But the resistance of the friction is less than the strength with which the earth tugs at the water, and therefore the wheel goes round and the water rushes down. The force which really grinds the hard corn into flour is terrestrial attraction! Gravitation of material substance towards material substance, acting with an energy proportioned to the relative masses and to the relative distances of the elements concerned.

Let us now suppose that the matter drawn towards the earth is not free to move. Let us fancy, for instance, a drop of the running water all at once stopped in its downward path by the attachment of a string from above. The earth would then tug at that string in its effort to get the drop of water, and would consequently stretch it to a certain extent. The power that was before expended in causing the drop to move, would be now employed in striving to tear asunder the substance of the string. A heavy body hanging by a cord from a fixed point is then in this predicament. It is drawn towards the earth, but is prevented from moving to it. It consequently finds a position of rest in which it is placed as near to the source of attraction as the suspending string allows; that is, it hangs perpendicularly and immovably beneath it, stretching the string by its tendency towards the ground.

If, however, the suspended body be raised up from its position of forced repose by any interference that draws it to one side, the string being still kept on the stretch, it will be observed that it has been made to move in a curved line away from the earth's attracting mass, and that the pull of the attraction is then to a certain extent taken off from the string and transferred to the supporting hand; the force of the attraction consequently becomes then sensible as the weight of the body that is upheld. If in this state of affairs the supporting hand is taken away, the body at once rushes down sideways to the position it before occupied, with a pace accelerating considerably as it goes; for the earth continues to attract it during each instant of its descent. When it has reached the second stage of its journey, it is moving with a velocity that is caused by the addition of the attraction exercised in that stage to the attraction that had been exercised in the first stage; and so of the third, fourth, and other successive stages. It must go quicker and quicker until it comes to the place which was before its position of absolute repose.

But when it has at last arrived at this place, it cannot rest there, for during its increasingly-rapid journey downwards, it has been perseveringly acquiring a new force of its own—an onward impulse that proves to be sufficient to carry it forward and upward in spite of the earth's pressing solicitation to it to stay. Moving bodies can no more stop of their own accord than resting bodies can move of their own accord. Both require that some extraneous force shall be exerted upon them before the condition in which they are can be changed.

Now, in the case of the vibrating pendulum, it is the downward pull of the earth's attraction that first causes the stationary body to move, and as this commencing motion is downwards, in the direction of the pull, it is also an accelerating one. As soon, however, as this motion is changed by the resistance of the string into an upward one, it becomes a retarded one from the same cause. The body is now going upwards, away from the earth, and the earth's attraction therefore drags upon it and keeps it back instead of hastening it. As it travels up in its curved path, more and more of its weight is taken off the string, and thrown, so to speak, upon the moving impulse. In the descending portion of the vibration the weight of the body increases its movement; in the ascending portion it diminishes its movement. At last the upward movement becomes so slow, that the impulse of momentum is lost, and the

earth's attraction is again unopposed. The body then begins to retrograde, acquires progressively increasing velocity as it descends, overshoots the place of its original repose, and once more commences the ascent on the opposite side.

Whenever, then, a heavy body suspended by a flexible string is drawn to one side, and dropped from the hand, a vibrating pendulum is made, because weight and acquired impulse influence it alternately with a sort of see-saw action, the power of the one diminishing as the power of the other augments. Weight pulls down—confers velocity and impulse during the pulling—and then velocity carries up. As velocity carries up, weight diminishes its impulse, and at last arrests it, and then begins to pull down again. In the middle of the vibration velocity is at its greatest, and weight at its least, as regards their influence on the motion. At the extremes of the vibration velocity is at its least, and weight at its greatest. Now here it is the earth's attraction clearly that confers the impulse of the downward movement, just as much as it is the earth's attraction that causes the downward movement of running water. Therefore the power which makes the pendulum swing is the same with the power which grinds the corn in the water-mill—the attraction of the earth's vast mass for the mass of a smaller body placed near to its surface under certain peculiar conditions of position.

But there is a very startling reflection connected with this consideration. How strange it is that the vast 'substantial fabric' of the earth should, after all, present itself as one grand source of motion in terrestrial things! Gravitation, weight, the majestic influence that holds the stable pyramid upon its base through centuries of time, condescending to turn the restless wheels of man's machinery! When the expansive burst of the vapour confined within the cylinder of the condensing steam-engine thrusts upwards the piston-rod with its mighty beams, it is simple weight—the weight of the superincumbent transparent atmosphere—that crushes the metal back with antagonistic force. When particles of water have been sublimated into the air by the heating power of the solar rays, it is simple weight—the weight of their own aqueous substance—that brings them down again, and that causes their falling currents to turn the countless mill-wheels implanted in the direction of their descent. When isolated tracts of the atmosphere have been rendered rare and light under the concentrated warmth of the sun, it is simple weight—the weight of colder and heavier portions of the air—that makes winds rush into the spots where the deficient downward pressure is, and that causes the sails of innumerable windmills to whirl before the impulse of the breeze.

In the steam-engine we see the earth's gravitation and artificial heat combining to effect sundry useful purposes, requiring enormous expenditure of effort. In windmills and watermills we see the earth's gravitation and natural or solar heat working together to perform like service. In the pendulum, the earth's gravitation acting alone as an enumerator of passing moments; for the momentum conferred by motion is after all but a secondary result, an offspring of the earth's attraction. In the steady oscillations of this little instrument no less a power is concerned than that grand elementary force of nature, that is able to uphold the orbital movements of massive worlds. In the one case, the majestic presence is revealed in its Atlantean task of establishing the firm foundations of the universe; in the other, in its Saturnian occupation of marking the lapse of time. In the planetary movements, material attraction bends onward impulse round into a circling curve; in the pendulum oscillations, material attraction alternately causes and destroys onward impulse. In the former it acts by a steady sweep; in the latter by recurring broken starts. The

reason of the difference is simply this: the planetary bodies are free to go as the two powers, attraction and impulse, urge them. The weight of the pendulum is prevented from doing so by the restraining power of the string or rod, that holds it bound by a certain invariable interval to a point of suspension placed farther than the weight from the source of attraction. A pendulum, in all its main features, is a terrestrial satellite in bonds—unable to fall to the surface of the earth, and unable to get away and circle round it, yet influenced by a resistless tendency to do both. Its vibrations are its useless struggles to free itself from the constraint of its double chains.

THE COUNTRY COUSIN.

THE village of Westbourne was what Americans would call a stylish place, though situated deep in the heart of Derbyshire. Most of its houses had green palings and flowers in front; there was a circulating library, a milliner's shop, and a ladies' boarding-school, within its bounds; and from each extremity of its larger and smaller street—for Westbourne had only two—outlying cottages of various names dotted the surrounding fields. The largest of these, and decidedly the handsomest, belonged, as the door-plate set forth, to Mr Harry Phipps Bunting. It had been called Bunting Cottage, ever since the late possessor—after having made what his neighbours esteemed a fortune, by himself keeping the circulating library, and his spouse the boarding-school—built it by way of consolation for the second year of his widowhood, and retired there from business to hold high gentility in his latter days with his only daughter and heiress, Miss Jenny. At least half of Westbourne believed that in the said arrangements Mr Bunting had his eye on a second and somewhat superior match: in short, those good people averred that the handsome cottage was neither more nor less than a substantial snare for Mrs Phipps, the widow of a captain and second-cousin of a baronet, who, with a small annuity and an only son, lived in the odour of great rank and fashion in a neat brick-house at the other end of the village.

But if Mr Bunting had indeed indulged in speculations on the widow's heart, they were cut short by a sudden summons to take the journey on which his early partner had preceded him; and Miss Jenny was left the undisputed heiress of all his gains and gatherings, now amounting to a comfortable sum in a London bank, besides the newly-built cottage. None of the village remembered the time when Miss Jenny was young—not but that there were older ladies in the community, and few who wore their years so well—but a matronly staidness and industry, a solidity of manner and appearance, had grown so early on the lady, that she had no youth, and scarcely any childhood, in the recollection of her neighbours, and she was now on the shady side of thirty.

Miss Jenny might have had suitors, had her encouragement been more liberal: where is the maiden of fortune who might not? But she had no admirers, though there was not a more popular woman in Westbourne. Time out of mind she was known to have a good advice and a helping-hand for all who required either. The help was always kindly given, and the advice generally judicious: indeed, if Miss Jenny had a weakness, it was the love of direction and counsel-giving; and by that breach the strong citadel of her heart was won. There was no house in Westbourne that gave her abilities half such scope as that of Mrs Captain Phipps—so the lady continued to style herself. Miss Jenny's father had advised there till he departed; after which event, the widow and her son confided in his heiress. Master Harry Phipps was not what would be called a successful young man. He was not either wild or remarkably

stupid, as the world goes; his mother knew him to be a dear domestic fellow, who would play the flute or dominos for weeks of evenings in her back-parlour. He had taken one prize at college and sundry at school; had the reputation of being almost a beau, and, at least in Westbourne society, half a wit; and was a tall, fair-faced, lathy young man, dressing well, and looking rather genteel, in spite of an overgrown boyishness which hung about him and kept the Master fastened to his name, though he had left twenty-five behind him. Master Harry had made attempts on law, physic, and divinity, without completing the studies requisite for any of those learned professions; somehow he had always got disgusted when just half-way, and at the time of our tale, had a serious notion of civil engineering. The fates, nevertheless, chalked out another line for Master Harry Phipps. How it first came about the keenest-eared gossips in Westbourne never knew, but the widow's son was observed to become a frequent visitor at the cottage as the days of Miss Jenny's mourning for her father expired. In these expeditions he was occasionally supported by Mrs Captain Phipps, who at length told her confidential friends, and they informed the village, that her son was about to marry, and take the name of Bunting. Some said that Miss Jenny insisted on the latter step as a badge of her perpetual sovereignty; some that it was a provision in her father's will, the old gentleman having been heard to hope that none but Buntings would ever inhabit the cottage; but while they disputed that point the wedding came off with a liberal distribution of cards, cake, and gloves, a breakfast, at which Mrs Captain Phipps presided, and an excursion of three weeks to the Lakes; after which, Mr and Mrs Phipps Bunting, having got a new door-plate, and an additional crest on the spoons, settled down comfortably at home, where our story found them.

There they were duly visited and made due returns, even to their uttermost acquaintance. Evening parties were got up for their benefit, as Westbourne gentility dictated. A few responses were given at the cottage, and people learned to call them the Buntings. When these occurrences and the talk concerning them were fairly over, it was surprising how little things had altered. Mrs Phipps Bunting superintended everything, from the napery in the drawers to the bee-hives in the garden, with so much of her old and independent activity, that people caught themselves occasionally calling her Miss Jenny. As for her lord, he was Master Harry still. Matrimony made no change in him. On Sundays he dressed himself and went to church with Mrs Phipps Bunting. On week-days, he said he studied, paid little visits, took small excursions, and came home to dinner. Even bachelors agreed that he lived under the mildest form of gynocracy. Mrs Captain Phipps gave him good advices at the one end of the village, Mrs Phipps Bunting kept him all right at the other; and between them an indescribable amount of nobodyism grew and gathered around him.

Mr Phipps Bunting—as the best bred of his neighbours now endeavoured to call him—was doubtless not less contented than most men in the married state. Miss Jenny—that was—made a noble housekeeper, that was natural to her; she was not given to storms nor temper, nor fault-finding, nor what is called gaiety: they had kind country neighbours; and Mrs Phipps Bunting sometimes spoke of her mother's relatives, who were known to be fine people in London.

There was no appearance of change when the second of their wedded years commenced; but one December morning an extraordinary event occurred at the cottage, for Harry received a letter. It came from Charles Lacy, an old college-friend, whose achievements in the fast line had furnished him with many a joke and tale. He had been till lately a briefless barrister, but had just fallen heir to a neat property in an

adjoining county, bequeathed him by a distant relative, his advent to which he intended celebrating with a notable bachelors' party, and Harry's presence was requested, together with that of many a college comrade.

'I think I'll go,' said Harry, in a hesitating tone, as the note was read at the breakfast-table.

'Of course you will, dear,' said Mrs Bunting. 'And now that I think of it, something must be done with that parlour chimney, it smokes so. Just send up the mason on your way to the coach.'

The vehicle thus mentioned was an old stager which passed through Westbourne daily, carrying passengers to sundry of the unrailwayed towns on its track; and within two hours from the receipt of the invitation Mr Phipps Bunting, well wrapped up, and better warned against taking cold, with his best things in a carpet bag, and his lady's commands delivered to the mason, took possession of an inside seat on his way to Charles Lacy's domicile.

How the bachelors' party proceeded in that locality, and how the failings of the parlour chimney were corrected at the cottage, imaginative readers may suppose; but on the third day after Harry's departure there arrived a note, stating that his host had invited him to remain for a fortnight, that they were to have shooting in the fine frosty weather; and he thought he might stay. Mrs Phipps Bunting sent her approbation by return of post. There was a colony of rats to be expatriated, a clearing out of the coal-cellar to be achieved, and a bottling of cider to get forward, under which considerations she concluded he was better out of the way; but all these things were accomplished, and more than the specified time elapsed, when another note came to say that Lacy positively would not let Harry home without seeing his uncle, the great barrister, who lived in the nearest assize town; and the legal protector of Miss Jenny 'thought he might go on that visit.'

There was a graver and more lengthy reply to that communication; but the fates forbade that Harry should read Mrs Bunting's in time. Charles Lacy's house-keeper had a standing-order to put all letters into a huge card-bracket, which that young gentleman affirmed had been presented to him by an heiress of £20,000 in her own right; and Mrs Bunting's epistle was placed in the receptacle—for before its arrival Harry had, like an undutiful husband, started with Charles for the house of his uncle. The old barrister, though not one of the brightest, was among the successful of his profession, and kept a hospitable, easy-going house, with a maiden sister and two dashing nephews, in a comfortable English country town, at one end of which was a railway station for the coming and going of London trains. Our Harry had been always an agreeable, com-modious fellow. There were no angles on his temper to come in contact with those of other people: rich uncle, maiden aunt, and sporting nephews, all joined in requesting his stay from week to week; while three successive notes were in turn committed to the card-bracket on Charles Lacy's mantelpiece.

'Harry, my boy,' said that gay gentleman, as they stood looking at a passing train, 'what do you say to a run for London? I have another uncle there—a first-rate solicitor in the firm of Grindley, Blackmore, & Co. Ours is a legal family. Grindley and the old hen would be glad to see us; and I'll introduce you to the Blackmores, a delightful mother and four daughters; all charming girls with three thousand a piece. I wish you could only hear Clementina Blackmore sing *Will you still be true to me?* Harry, if ever I am so left to myself as to think of marrying, that's the girl!'

Let us now suppose that a quantity of additional pressing took place—that the nephews offered to go along as Christmas was coming—that Harry sent home another note to say 'he thought he might go'—and that long before it reached the cottage, he was installed

at the house of Mr Grindley in London, who, as his nephew promised, divided a capital legal business with his partner Mr Blackmore.

The proverb which says, 'Out of sight out of mind,' was by this time in course of being fulfilled as regarded the good woman at the cottage. In the revival of old associations his college-friend partially forgot that Harry was a family man, and the easy gentleman himself never thought of intruding the circumstance on people's notice. To do him justice, he had a remarkably single look; all his acquaintances called him Harry Phipps. It was therefore no marvel that the unsuspecting household of Blackmore received him as a bachelor.

The papa of it was a hard-witted, busy lawyer; the mamma an excessively fine lady; and the four daughters pretty, accomplished, fashionable-looking girls, from twenty-two—their mamma said seventeen—upwards, who judiciously came out in different lines; for Miss Blackmore was metaphysical, Miss Caroline sentimental, Miss Maria fast, and Miss Clementina musical. Between the last mentioned and Charles Lacy a strong and not discouraged flirtation was in progress, which afforded Harry better than ordinary opportunities for cultivating that domestic circle. It was not every day he would have such a house to call at, and Harry did his best to be popular. He hunted up high-life gossip for Mrs Blackmore; he admired the solicitor's law-stories after dinner; he was the humble servant of all the young ladies in turn, but his chief devoirs were paid to the fast Maria. The reason was that the fast Maria would have it so. She thought him, it is true—as she said once to a confidential friend—a sort of goosey - goosey - gander, but he polked capitally, was a personable fellow—and Maria was a spinster. Christmas was coming, and Harry stood high in favour with all the Blackmores. The senior miss found out that he had a philosophic mind; Miss Caroline said she knew there was a little romance about him—he had been disappointed in first-love or something; and Charles Lacy had an intuitive suspicion that the old people would soon begin to inquire regarding his income and prospects. The idea was excessively amusing, but yet somewhat alarming. He thought Harry was carrying it on too far—he was. Hadn't he better give Clementina a hint? But then Clementina would think he ought to have done so long ago. Charles was puzzled, and he did not like to be puzzled. He would have nothing more to do with it. He would wash his hands of it. How was he obliged to know that they were not aware of Harry's being tied up? The whole thing was really uncomfortable, and he did not like anything that was uncomfortable. He would take Harry to task for his enormity, and then think no more about it. Meditating thus, he entered Mrs Blackmore's drawing-room one forenoon early enough to find mamma and the young ladies hard at Berlin wool—they were finishing Christmas presents—all but Maria, for whose amusement Harry was turning over a volume of sporting prints at a little table by themselves.

'We are all industrious to-day,' said Mrs Blackmore, 'on account of our country cousin—a dear odd creature. She has sent us hampers and baskets full of everything nice, for I don't know how long. The girls can scarcely remember when she was here last, and it would be such a comfort to her to have some of their work. Do, Maria, try and finish that purse.'

Charles and Harry had heard of that 'dear odd country cousin' ever since they first entered the house. The turkeys and chickens she sent had been described in their hearing till they thought they had eaten them. From the conversation of her relatives Harry concluded her to be a spinster or widow of an uninteresting age. However, the threatened arrival created a new employment for him in the shape of holding purse-silk for Miss Maria to wind; and owing perhaps to the

quietness of this employment—perhaps to its occupying so long a time—the awkwardness of his position began to stare him in the face. He began to think he was a bad fellow—although it was all Charles's fault. He did not know that Miss Maria thought him a goosey-geosey-gander, but he began at last to hate her all the same—we are so liable to hate those we are conscious of injuring! He became in truth afraid of her—she haunted him. He knew he ought to do something, but he did not know what to do. He had all his life acted under advice, and he now felt as if he had broken from his moorings, and was on the wide, wide sea, drifting at the mercy of this calamity.

At the moment we have arrived at, things had come to an alarming climax. In reply to his bewildered look Charles had turned away with severity—washing his hands of it—to join Miss Clementina in the corner; and the rest of the family, who seemed suddenly to find themselves *de trop*, scattered away to other parts of the room. Now Miss Maria was a fast girl, and Harry knew it. She looked wicked, as if determined upon a *coup d'état*; and he began to perspire all over. The skein fared badly. At this moment some slight diversion was made in his favour by a servant appearing with a message regarding somebody in the back-parlour; whereupon Mrs Blackmore went hastily down stairs; and Harry's eyes followed her wistfully: he thought he should like to get out.

'Oh, girls,' said Caroline, returning in a few minutes, 'it is poor cozy, and mamma is bringing her up for us all to comfort her. She has lost I don't know how much money by the failure of that horrid Skinner's bank; and what's worse, she can't find her husband.'

'He ought to be sent home wherever he is,' replied Maria; 'I'm sure she was just too good to him. Oh, Mr Harry Phipps, what a sad set you men are! I declare you are ravelling again.'

Harry, colouring to the roots of the hair, bent forward to plead some unintelligible excuse; the fast Maria took hold of his finger as if she was cross; and at that instant another finger was pressed upon his shoulder, and looking up, he gazed into the eyes of his wife!

For some seconds Harry and his spouse looked at each other as if unable to believe their eyes; but the lady's good sense at last prevailed, and gulping down something which would have come out with most women, she gently shook her husband's hand, now liberated from the purse-silk, with 'Harry, love, I am so glad to find you here. I was really afraid that worse had happened than the failure of Skinner & Co.'

Harry replied in rather an indistinct tone, though Charles Lacy ever after vowed he did wonderfully, considering the looks of Mrs Blackmore and her daughters. As for Maria she retired from silk and all, without a word about deceivers, which was also remarkable. Sense in the person of Mrs Bunting for once appeared contagious. The Blackmores, one and all, tacitly agreed that there had been no mistake whatever in the family, beyond the droll particular of their not recognising in a gentleman introduced to them as Mr Harry Phipps the husband of a lady whom they had been accustomed to address as Mrs Bunting. By the failure of Skinner & Co. poor Mrs Bunting had lost everything but the cottage and furniture at Westbourne; a fact which she learned only on her arrival in London to pay a long-projected visit to her mother's relatives, the Blackmores.

The Buntings in due time went home. We have reason to believe that there was never even a curtain-lecture delivered on the subject of the purse-silk. When we last visited Westbourne, Mrs Phipps Bunting was as active, as good-natured, and as popular as ever; but people had forgotten to say Master Harry, for Henry Phipps Bunting, Esquire, had been appointed Her Majesty's stamp-distributor for the district. He

was also invested with a couple of agencies for certain absent proprietors; but he never again 'thought he might go' on sporting-excursions; and no family could have imagined him to be a bachelor, for ever since he set fairly to work, a more married-like man we never saw.

THE DROLLERIES OF FALSE POLITICAL ECONOMY.

WINES AND OTHER LIQUORS.

THE portion devoted to the subject of intoxicating liquors would make a curious chapter in the history of legislation in almost every European country. Here there is a double cause of disturbance, since besides notions about the balance of trade and the like, many well-meaning, though not always judicious, attempts have been made to render such legislation conducive to sobriety and morality. Thus among the Irish statutes one stumbles on an act of Queen Elizabeth's reign 'Against making of Aqua Vite.' It is justly described as 'a drink nothing profitable to be daily drunken and used,' 'and thereby much corn, grain, and other things are consumed, spent, and wasted to the great hinderance, loss, and damages of the poor inhabitants of this realm'—for which reason are passed provisions, not to modify but entirely to suppress it—with what effect we may easily know. But our object at present is not with legislation for the suppression of drunkenness, which always deserves favourable consideration, but with the commercial regulations affecting liquors, and the strange notions of political economy involved in them. The subject is so ample that we are obliged to restrict our illustrations almost entirely to one small country—Scotland.

It will rather surprise the reader perhaps to find that, for the promotion of their economic ends, the laws seem to have been directed more to the encouragement than the suppression of drinking. The earliest interference with commerce in liquors appearing among the Scottish acts of parliament is very imperious and comprehensive, but not very explicable in its objects. Statutes at that time were short, and it will cost the reader little trouble to peruse that which was passed in the year 1436, and the reign of James I., 'anent Flemish wines.' 'It is statute and ordained that no man buy at Flemings of the Dane in Scotland, any kind of wine, under the pain of escheat (or forfeiture) thereof.' Doubtless parliament believed that it had reasons for this enactment, but it would not be easy to find out at the present day what they were. In 1503 a more minute act was passed referrible to ale and other provisions. It appoints magistrates of towns 'that they set and ordain a certain price, goodness, and fineness, upon bread, ale, and all other necessary things that is wrought and daily bought and used by the king's lieges. And that they make certain purviews and examinations to wait daily upon the keeping thereof. And when any workman be's noted taking an exorbitant price for his stuff, above the price, and over far disproportionate of the stuff he buys, that he be punished by the said barons, provosts, and bailies, &c.' A little later, in 1540, an act was passed 'touching the exorbitant prices of wine, salt, and timmer.' The provisions that follow are somewhat curious, and rank among the most barefaced instances of a class legislating, not only for its own interest, but its own enjoyment. In the first place, the provosts and bailies—supposed to be always excellent judges of good cheer—are to fix a low and reasonable price at which the wines and other commodities are obtainable. When this is fixed, it is appointed that 'na man is to buy till the king's grace be first served. And His Grace and officers being con-

tent for so meikle (much) as will please them to take to our sovereign's use entirely, that noblemen of the realm, such as prelates, barons, and other gentlemen of the same, be served at the same prices; and thereafter all and sundry our sovereign lord's lieges be served at the same prices.' Evidently it was cunningly foreseen that but little wine would be imported at a compulsory and necessarily an unremunerating price. Of such as did come, and was thus sold cheap, the 'prelates, barons, and other gentlemen' who sat in parliament, sagaciously provided that they should have the pre-emption; and it is pretty clear that the 'all and sundry' who were to come after them would have little chance of obtaining any of the cheap wine.

Fifteen years afterwards, during the regency of Mary of Lorraine, it was found that the act just cited was not sufficiently stringent, and that some sterner provision must be made to enable the aristocracy to get cheap wine. An act was passed referring to the previous one, and stating that 'nevertheless the noblemen—such as prelates, earls, lords, barons, and other gentlemen—are not served according to the said act, but are constrained to buy the same from merchants at greater prices, contrary to the tenor of the said acts.' Hence it is declared that whenever wines have arrived in any town, and the prices have been fixed, the magistrates 'shall incontinent pass to the market-cross of that burgh, and there, by open proclamation, declare the prices of the goods foresaid as they are made, and that none of the goods foresaid be disposed of for the space of four days.' Thus were measures taken to let the privileged persons have the benefit of their pre-emption.

That these acts, and the proclamations for enforcing them, were not a dead letter is shewn by the criminal records. On the 8th of March 1550, Robert Hathwy, John Sym, and James Lourie, burgesses of Edinburgh, confess their guilt in transgressing a regulation against purchasing Bordeaux wines dearer than L.22, 10s. (Scots of course) per tun, and Rochelle wines dearer than L.18 per tun. On the 4th of May 1555, George Hume and thirteen other citizens of Leith were arraigned for retalling wines above the proclaimed price—which for Bordeaux and Anjou wine was 10d. per pint; and for Rochelle, Sherry, and something called Caneseoch—which may for all we know to the contrary mean Cognac—8d. per pint.

In Ireland the privilege of having their wine cheaper than other people was given to the aristocracy with almost more flagrant audacity. By the Irish statute of the 28th Elizabeth, chap. 4, imposing customs-duties on wines, the lord-lieutenant is not only authorised to take for his own consumption twenty tuns, duty free, annually, but he is at the same time declared to have 'full power to grant, limit, and appoint, unto every peer of this realm, and to every of the Privy-Council in the same, and the queen's learned counsel for the time being, at his or their discretion from time to time, such portion and quantity of wines, to be free and discharged of and from the said customs and subsidy, as he shall think to be mete and competent for every of them, after their degrees and callings to have.'

To return to Scotland. In the ensuing century we find the legislature resorting to the homely liquor of the working-classes. On the 28d December 1669, an act was passed which begins in the following considerate and paternal fashion:—

'Our sovereign lord, considering that it is most agreeable to reason and equity, and of universal concernment to all his majesty's subjects, and especially to those of the meaner sort, that a due proportion be observed betwixt the price of the boll of beer and the pint and other measures of ale and drinking-beer rented and sold within this kingdom, that thereby the liberty taken by brewers and vintners, to exact exorbitant

prices for ale and drinking-beer at their pleasure, may be restrained. Therefore his majesty, with advice and consent of his estates of parliament, doth recommend to and authorise the lords of his majesty's Privy-Council from time to time, after consideration had of the ordinary rates of rough beer and barley for the time, to regulate and set down the prices of ale and drinking-beer rented and sold in the several shires and burghs of the kingdom, as they shall think just and reasonable.' The council were authorised to make their regulations by acts and orders, 'and to inflict such censures, pains, and penalties upon the contraveners of these acts and orders as they shall think fit; and to do all other things requisite for the execution of the same.'

When the Scottish Privy-Council ceased to exist by the union with England, there was some difficulty in knowing how this act should be applied. The Court of Session, looking upon the supply of ale as vital to the country, took on itself to protect the public, just as a passenger sometimes undertakes the management of a vessel which has lost its proper commander. On the occasion of the malt-duty being extended to Scotland in 1725, they thought a juncture had come when it was absolutely necessary to interfere, as there was no saying how far the brewers, let loose from the old regulations of the Privy-Council, might abuse the public by charging an extravagant price or selling a bad article. The Court of Session is the supreme civil tribunal in Scotland. Its rules of court for the regulation of judicial proceedings are called 'acts of sederunt.' On this occasion it passed 'an act for preventing the sale of bad ale.' The object was an excellent one, but we are apt at the present day to consider that brewers under the influence of competition can best save the public from bad ale, and that judges are better employed when they direct their attention to the protection of the public from bad law. They enacted that the brewers should sell by wholesale at a merk Scots per gallon, and that dealers should sell by retail at 2d. per pint. They professed to make this regulation from 'taking into consideration the frequent abuses in vending and retalling bad twopenny ale; and that from the present duties and burdens wherewith the brewers of ale in and about the city of Edinburgh are charged, occasion may be taken by ill-designing persons to impose on the lieges and undersell fair dealers, unless the prices for brewers and retailers be certain and fixed.'

The brewers threatened to give up their business, and the court found it necessary to take farther measures. Another act of sederunt was passed. It is best, we think, where their contents are so curious, to quote the documents themselves, however stiff or formal they may seem, and the commencement of the act follows:

'Whereas, in the information and memorial this day offered by his majesty's advocate to the Lords of Council and Session, it is represented that the brewers within the city of Edinburgh and liberties thereof, and others who have the privilege of furnishing the said city with ale, have entered into a resolution and confederacy that they will at once give over brewing when the duties on malt granted to his majesty by act of parliament are attempted to be recovered; that this resolution and confederacy must bring much distress on the good people of the said city through want of ale, and likewise by want of bread, the preparing whereof depends upon yeast or barm, and must produce tumults and confusions, to the overthrow of all good government, and to the great loss and hurt of the most innocent of his majesty's subjects, and is most dangerous and highly criminal.'

Thus, it being clearly shewn that the refusal of brewers to brew ale at the price fixed by the judges of the Court of Session must produce something like a French revolution, and be followed by general anarchy, the court next proceeds to declare—not in the best of

composition—'that it is illegal and inconsistent with the public welfare for common brewers, or others whose employment is to provide necessary sustenance for the people, all at once to quit and forbear the exercise of their occupation, when they are in the sole possession of the materials, houses, and instruments for to carry on the trade, so that the people may be deprived of, or much straitened in their meat or drink; and that so to do in defiance and contempt of the laws is highly criminal and severely punishable. And therefore the said Lords of Council and Session, to prevent the mischiefs threatened to the city and limits aforesaid, do hereby require and ordain all and every brewer and brewers within the city of Edinburgh and liberties thereof, and others who have the privilege of furnishing the said city with ale, to continue and carry on their trade of brewing for the service of the lieges.'

It is astonishing to find that the brewers gave way. Scotland was at that time much under government and aristocratic influence; and very likely the poor men felt that it would be better to lose a little money than to fight a battle with the Court of Session, especially as the Lord Advocate threatened to indict them for a conspiracy. That they continued permanently to accept of the profits—or rather, perhaps, losses—fixed by the Court of Session no one will believe. They would in due time manage to get the usual profit of capital and exertion from their operations, or else would contrive to give up business.

It is one of the consequences of adopting false and artificial notions on political economy, that these drive the most conscientious and virtuous men to the most mischievous and violent extremities. Where things should be left to themselves they believe interference to be right, and so believing, they think it necessary to carry out their views at whatever cost. A remarkable instance of this was shewn by the virtuous and high-minded Duncan Forbes of Culloden. He thought the introduction of foreign commodities ruinous to the country. He considered that whatever was paid for them was so much lost to his fellow-countrymen. On this principle he waged a determined war against a foreign commodity coming into vogue in his latter days, using all his endeavours to suppress its use, and substitute for it a commodity of home-produce. Will the reader, in the days of temperance societies, believe that the commodity which he desired to suppress was *tea*, and that which he wished to encourage was *beer*? Here are his own words in a letter to a statesman of the time: 'The cause of the mischief we complain of is evidently the excessive use of *tea*, which is now become so common that the meanest families even of labouring people, particularly in burghs, make their morning's meal of it, and thereby wholly disuse the ale which heretofore was their accustomed drink; and the same drug supplies all the labouring women with their afternoon's entertainment, even to the exclusion of the twopenny.' After so formidable a picture, it is not unnatural to find him thus crying out against the influence of Dutch enterprise, which was then spreading the drink which cheers but not inebriates throughout Europe: 'They run their low-priced tea into Scotland, and sold it very cheap—a pound went from half a crown to three or four shillings. The goodwife was fond of it because her betters made use of tea; a pound of it would last her a month, which made her breakfast very cheap, so she made no account of the sugar which she took up only in ounces. In short, the itch spread; the refuse of the vilest teas were run into this country from Holland, sold and bought at the prices I have mentioned; and at present there are very few cobblers in any of the burghs of this country who do not sit down gravely with their wives and families to tea.'

What a frightful picture! We may laugh at it, but

it feally was frightful to one who sincerely believed that the money paid for tea was a dead loss to the country, and who did not know that the tea was paid for by the exportation of home-produce.

FAMILY LIFE IN A NEGRO TOWN.

THERE is a large mass of mankind occupying an intermediate position between the savage and the civilised nations of the world. These have no literature of their own, yet they have received some amount of knowledge by tradition or communication with other people. They know little or nothing of science, yet they are skilled in some of the useful arts of life. They have no regular legislation nor codes of civil law, yet they have forms of government and unwritten laws to which they steadfastly adhere, and about which they can plead as eloquently as a Chancery barrister or an advocate in the Courts of Session. While they cultivate the ground, keep cattle, and live upon the lawful products of the soil, they have none of the culinary dainties of life; whilst they plant the cotton-tree, and weave and dye cloth to make their garments, their clothing is scant, and devoid of all excellence in the manufacture. As far removed from the polite European on the one hand, as from the savage Indian or the rude Hottentot on the other, they may be rightly termed the semi-barbarous portion of mankind. It is a curious question how they came to occupy this middle state of civilisation, which they have retained for so many centuries. We know that the wandering tribes of Asia, and some of the kingdoms of that continent which partake of the characteristics now described, in former ages enjoyed seasons of national splendour and gleams of civilisation, the twilight of which has not yet passed away; but we know nothing of the history of Central Africa, a large part of which is composed of semi-barbarous nations.

We now specially refer to that portion of the African continent which lies between the Great Desert and the Kong Mountains, with a continuation toward Lake Tchad—comprising a tract of country about 300 miles in length and 2000 in breadth. South of this latitude the people are more barbarous and cruel, and the deserts of the west are inhabited by tribes more purely negro and ignorant. Moors, Mandingoes, Foola, and Jaloofs, principally dwell in this vast region of West-Central Africa. All these peoples are more or less European in their form and countenance; the pure negroes occasionally mixed with them being probably imported slaves or their descendants. These nations differ from each other in their languages, and in some of their customs and manners; but there is a similarity in their mode of living, if we except the Moors, which makes it as unnecessary as it would be tedious to describe each of them separately. We wish to make our readers acquainted with the forms and habits of semi-barbarous life, whatever local name or geographical appearance it may assume.

The first and most important feature of observation is the position of the female sex. This regulates the size of the houses and the towns, the nature of agriculture, and the whole social economy. In Africa the women are emphatically the working-class of the community, and hold an intermediate station between wife and slave, occupying the rank and employments of both. A wife is usually bought for so many head of cattle or such a number of slaves, and then becomes the property of her husband. There is no limit to the number of wives. Even the Mohammedan negroes do not conform to the Koran in its restriction to the number of four. One chief boasted that he had eighty wives; and upon the Englishman answering that his countrymen thought one woman quite enough to

* Culloden Papers, 191.

manage, the African flourished a whip, with which he said he kept them in order. In some countries one of these wives is recognised as head-wife, and enjoys certain prerogatives appertaining to this place.

Being desirous of obtaining an insight into the minutiae of African life, we accepted the invitation of a negro who traded on the Gambia to pay him a visit, and spend a day in his town, especially as there would be a dance in the evening. We left our vessel in the morning, and having rowed for some miles up a tributary stream, landed in an open place. Here we met the horses which Samba had sent for us, as the town lay at a considerable distance. They were fine animals, of a small breed, but very spirited, and apparently only half-trained. Their accoutrements were in some respects novel; for the saddle was an unwieldy article, with a high pommel in front, and an elevation behind, so that we were fairly wedged in the seat, and had many thumps before we learned to sit correctly in these stocks. We therefore had no wish, as we had little opportunity, of trying the speed of our beasts, the road lying through a vast forest. The men who accompanied us were armed with muskets, and kept a sharp look-out among the bushes, though there was not much fear of being attacked in this place by wild beasts in the day-time, as it was a frequented route, and had been often visited by the hunter. By and by we came to a stream, which was fordable in the dry season. Senegambia abounds with rivers and creeks; indeed it seems to be one of the best-watered regions of the earth, and has excellent means of communication for trade. These waters are full of fish, which form an important article of food for the people.

After crossing the river, we saw the place of our destination on a rising ground surrounded with fields. The town was surrounded with a low mud-wall and stockade to keep off wild beasts, and as a slight protection against roving freebooters. Larger towns, especially those belonging to warrior chiefs, have high mud-walls, sometimes with loopholes and bastions, and are capable of standing a siege where the enemy has neither cannon nor battering-rams. The gate was made of planks shaped with the axe, for the natives have no saws. The appearance of the place from a distance was very singular, for it consisted of 400 or 500 huts, all built in the same manner, with conical roofs thatched with grass. No chimneys, spires, nor windows relieved the monotony of the scene. Upon entering, we threaded our way through narrow passages, between high fences, as through the mazes of a labyrinth, where we might have wandered all day without finding an exit. At last our guides brought us to a wicket-door, through which we passed, and found ourselves in Samba's enclosure. He welcomed us with great cordiality, and led us towards his dwelling through a group of inquisitive women and children. It was a circular hut, rather larger than the others, and constructed with a little more care. The wall was composed of large lumps of clay in square blocks, laid upon each other while still wet; these speedily dry and harden in the sun, forming a substantial support, of about four feet high, for the roof. The roof is a conical frame of bamboo-cane thatched with long grass, having long eaves to protect the walls from the deluging rains of Africa. The most substantial of these dwellings are liable to be undermined by wet, if the ground be level, or to be penetrated by rain, if the roof be not kept in good repair; in which case the sides can no longer support its weight. For this reason, deserted towns soon become heaps of mud ruins, and finally a mound of clay.

The interior of Samba's dwelling was as simple as the outside. On one side was a platform or hurdle of cane, raised about two feet from the ground upon stakes. This served for a bedstead, and the bedding was composed of a simple skin or mat. Being rich, Samba

had other mats for himself and his friends to sit upon, and two or three low stools. His gun, spear, leathern bottle, and other accoutrements, lay in a convenient place: and we observed a couple of boxes, one of which contained clothes, and the other a heterogeneous mass of trifling valuables received from Europeans. Of course such boxes and their contents are not of frequent occurrence in these lowly dwellings. Near this hut was another small one which served for a kitchen: it contained some earthen pots, wooden bowls, and calabashes, with iron pots and neat baskets as articles of distinction. Here was also the large pestle and mortar, the use of which will be presently described.

Samba was dressed in the usual garb of a negro gentleman. He wore large cotton drawers, which reached half-way down the leg, and a loose smock with wide sleeves. On his feet were sandals, fastened with leathern straps over his toes, the legs being bare. His head was covered with a white cap encircled with a Paisley shawl—which I had formerly given him—and which was worn in the manner of a turban. Two large *greegrees* or amulets—being leathern purses, containing some holy words or sacred scraps—depended from his neck by silken cords. This costume was pleasing, and set off his manly form to advantage. One of his wives immediately presented us with a calabash of sour milk, and some cakes of rice or pounded nuts and honey. The Africans have in general only two meals a day; but some, who can afford it, take lunch about two o'clock. Strict Mohammedans profess not to drink intoxicating liquors; but looser religionists cannot resist the temptation of rum, of which the pagan negroes drink to excess. Samba brought out a bottle of this liquor, and presented it with evident glee, himself doing justice to its contents.

We then proceeded to view the rest of the premises. Samba had six wives, each of whom had a separate hut. Their dwellings resembled that of their lord, but were of smaller size, and the doors were very low, so as to require considerable stooping to enter. These apertures for admitting light, air, and human beings, and for letting out the smoke, always look towards the west, for the easterly wind brings clouds of sand; and if the tornadoes which blow from the same quarter are allowed an inlet to a hut, they speedily make an outlet for themselves by whirling the roof into the air. The women were dressed in their best style on the occasion of our visit. One cloth, or *pang*, was fastened round their waist, and hung down to the ankles; another was thrown loosely over the bosom and shoulders. Their hair was plaited with ribbons, and decorated with beads, coral, and pieces of gold. Their legs were bare; but they had neat sandals on their feet. They were loaded with necklaces, bracelets, armlets, and anklets, composed of coral, amber, and fine glass-beads, interspersed with beads of gold and silver. These are their wealth and their pride. Some had little children, whose only covering was strings of beads round the waist, neck, ankles, and wrists: an elder girl of about ten years had a small cloth about her loins. We saw no furniture in their huts except a few bowls and calabashes, a rude distaff for spinning cotton, and the usual bed-hurdle covered with mats. The ladies were very garrulous and inquisitive, narrowly inspecting our skin and dress, and asking many questions about European females. They wondered how a rich man could do with only one wife, but thought monogamy was a good thing for the women. These mothers never carry their children in their arms, but infants are borne in a *pang* upon the back.

Another hut served for Samba's store, where he kept his merchandise; another was occupied by some female slaves, and another by male slaves. These poor creatures wore only a cloth round their loins, hanging as far as the knees; the females had each a necklace of

common beads given by their mistresses. At night they lie down upon a mat or skin, and light a fire in the middle of the hut. This serves both for warmth and to keep away noxious insects. Their furniture consisted of working instruments—hoes, calabashes, rush-baskets, and the redoubtable *paloon*. The last-mentioned instrument is a large wooden mortar made by the Loubies, a wandering class of Foolahs, one of the most stunted and ugly of African races, and quite different from the pastoral and warrior tribes. These roving gipsies work in wood, and may be called the coopers of Africa. When they find a convenient spot of ground furnished with the proper kind of trees, they immediately proceed to cut them down: the branches are formed into temporary huts, and the trunks are made into canoes, bowls, peatles and mortars, and other wooden utensils. Their chief implements are an axe and a knife, which they use with great dexterity.

The freemen are very indolent, and, with the exception of the Foolahs, seldom engage in any useful work. The time not occupied in hunting, fishing, travelling, or public business, is usually spent in indolent smoking, gossiping, or revelling. The male slaves are employed in felling timber, weaving, drawing water, collecting grass for horses, and helping the women in the fields; but as all this, excepting the first, can be done by females, the slaveholders do not care to keep many male slaves. Women generally attend to field-work. Before the rains set in, they make holes in the ground with a hoe, and, after dropping in seeds, cover in the earth with their feet. In case of rice, the surface of the ground is turned up with a narrow spade. After the rains the grain is ripe, and the tops are cut off. When the natives have not separate store-huts of their own, they keep their corn in large rush-baskets raised upon stakes outside the village; and these stores are not violated by their fellow-townsmen. The grain is beaten or trodden out of the husks, and then winnowed in the wind. The women pound it into meal or flour with a pestle nearly five feet long, the ordinary mortar containing about two gallons. This is a most laborious process, and occupies many hours of the day or night.

After gratifying, if not satisfying, the curiosity of Samba's wives, we thought it right that a return should be made by their explaining to us their mode of dressing food, especially the celebrated *kooskoos*. This was cheerfully done, the more so as we presented them with small articles of tinselled finery. The flour is moistened with water, then shaken and stirred in a calabash until it forms into small hard granules like peppercorns, which will keep good for a long time if preserved in a dry place. The poorer class wet this prepared grain with hot water until it swells like rice; others steam it in an earthen pot with holes, which is placed above another containing flesh and water, so that the flavour of the meat makes the *kooskoos* savoury. We saw a dish of this kind in preparation for our dinner, along with other stews of a daintier kind, made of rice boiled with milk and dried fish, or with butter and meat, not forgetting vegetables and condiments. Some of these stews, when well prepared, are not to be despised.

After inspecting the kitchen and its contents, our host conducted us to the *bantang* or *palaver* house, which answers the purpose of a town-hall and assembly-room. It is a large building, without side-walls, being a roof supported upon strong posts, and having a bank of mud to form a seat or lounging-bench. It is generally erected under the shade of a large tabba-tree, which is the pride of the town. Here all public business is transacted, trials are conducted, strangers are received, and hither the idle resort for the news of the day. As Africans are interminable speakers, they make excellent lawyers, and know how to spin out a case or involve it in a labyrinth of figures of speech. Mungo Park, who frequently heard these special pleaders, says

that in the forensic qualifications of procrastination and cavil, and the arts of confounding and perplexing a cause, they are not easily surpassed by the ablest pleaders in Europe. The following may serve as an example of their talent:—An ass had got loose and broken into a field of corn, much of which it destroyed. The proprietor of the corn caught the beast in his field, and immediately cut its throat. The owner of the ass then brought an action to recover damages for the loss of the ass, on which he set a high value. The other acknowledged having killed it, but pleaded as a set-off that the value of the corn destroyed was quite equal to that of the beast which he had killed. The law recognised the validity of both claims—that the ass should be paid for, and so should the corn; for the proprietor had no right to kill the beast, and it had no right to damage the field. The glorious uncertainty was therefore displayed in ascertaining the relative value of each; and the learned gentlemen managed so to puzzle the cause, that after a hearing of three days the court broke up without coming to any decision, and the cause was adjourned for a future hearing.

Another *palaver* which lasted four days was on the following occasion:—A slave-merchant had married a woman of Tambacunda, by whom he had two children. He subsequently absented himself for eight years without giving any account of himself to his deserted wife, who, seeing no prospect of his return, at the end of three years married another man, to whom she likewise bore two children. The *slaves* now returned and claimed his wife; but the second husband refused to surrender her, insisting that, by the usage of Africa, when a man has been three years absent from his wife without giving notice of his being alive, the woman is at liberty to marry again. This, however, proved a puzzling question, and all the circumstances on both sides had to be investigated. At last it was determined that the differing claims were so nicely balanced that the court could not pronounce on the side of either, but allowed the woman to make her choice of the husbands. She took time to consider; and it is said that, having ascertained that her first husband, though older than the second, was much richer, she allowed her first love to carry the day.

These lawsuits afford much amusement to the freemen of African towns, who have little employment, and to whom time seems to be a matter of no importance. Whether a journey occupies a week, a month, or a year, is of little moment, provided they can obtain victuals and find amusement in the place they visit. African labourers are quite surprised at the bustle and impatience of Englishmen; and when urged to make haste in finishing a job, will innocently exclaim—'No hurry, master: there be plenty of time: to-morrow comes after to-day.'

We went to see the blacksmith and saddler of the town. These are the only professional persons, and they are held in high esteem. The blacksmith is a worker in all kinds of metal, and combines the avocations of goldsmith, silversmith, jeweller, nailer, and gunsmith. In the interior, he also manufactures native iron by smelting the stone in furnaces with charcoal, which process converts it at once into steel: but as this operation is rudely performed, it is attended with a great waste of metal, which is also very hard and difficult to be worked; so that English iron is used when it can be obtained, and bars of iron form a considerable article of commerce. The blacksmith's utensils consist of a hammer, anvil, forceps, and a pair of double bellows made of two goat-skins. When we saw him he and his slaves were making stirrups, but the operation was very tedious.

The saddler tans and dresses leather, and can make a very beautiful and soft material by repeatedly rubbing and beating the hides. The thick skins are converted into sandals; those of sheep and goats are dyed and made

into sheaths of various kinds, purses for greengreases, covers for quivers and saddles, and a variety of ornaments, which are neatly sewn, as all negro lads can use the needle. These arts, with those of weaving, working in rushes, soap-making, and a rude pottery, constitute the native crafts. The Africans evidently understand the principles of many useful arts, and evince considerable ingenuity in the execution, considering the rudeness of their instruments, their want of capital, and the total absence of hired labour.

Suspended on a tree near the entrance of the town we saw the strange dress of bark called Mumbo Jumbo. This is a device used by the men to keep their wives in awe when the husband's authority is not sufficient to prevent family feuds and maintain proper subordination. It may be called the pillory of Africa, and is thus employed: Mumbo Jumbo announces his approach by loud cries in the woods, and at night enters the town and proceeds to the bentang, where all the inhabitants are obliged to assemble. The ceremony begins with songs and dances, which last till midnight, by which time Mumbo Jumbo has fixed upon his unfortunate victim. She is immediately seized, stripped, tied to a post, and scourged with Mumbo's rod, amid the shouts and derision of the whole assembly. No wonder that Mumbo Jumbo is held in great awe by the women!

When we had finished our walks about town, the day was far spent, and the setting sun bade us hasten to our lodging; for here there is no twilight, so that in a few minutes after the orb of day has disappeared night supervenes, and the moon rules the heavens. The few cattle which belonged to the inhabitants were brought into a pen at the town-wall, where they are watched at night by armed men. We found a fire of blazing wood in Samba's hut, and sat down on mats to gossip and smoke till dinner should be served. The ladies brought in the kooskooa, and other viands already described, in wooden bowls, and laid them on the floor; they then retired, as they never eat with the men. Each guest is expected to help himself with his fingers, and Samba hoped to play us a little trick in return for one played upon himself. When he visited us on board ship we provided only knives and forks, which all were expected to use. Poor Samba could hardly get a mouthful, and was the laughing-stock of the company, till in mercy a spoon was brought to him. He now ordered the stews to be made thin, and the meat to be cut up in small morsels, hoping to see us very awkward in using our fingers; when suddenly we produced pocket spoons and knives, which turned the joke against him and his negro friends, for the food was too watery for themselves to manage well with their hands.

After our repast we went out to see the dancing. This favourite amusement of the Africans takes place in the open air when the weather is fine; in wet weather it is held in the bentang, and when it is dark large fires are kindled to give light to the performers. They have two or three musical instruments, the chief of which is a drum. When this is beat, all the young folks become animated, and dance to the sound, clapping their hands, and performing a number of evolutions, some of which are not the most seemly. They keep up this exercise through a great part of the night; so that we left them in the midst of their sport, and retired to rest. Our preparations for sleep were soon made, by simply lying down upon the mats placed upon the hurdle. The negroes are very susceptible of cold, and complain of it when we are panting with heat; but the fire in their huts keeps up the desired temperature. They sleep very soundly, and cannot be easily aroused till after sun-rise. In the morning we made a slight repast of gruel, to which a kind of hasty-pudding with shea-butter was added for our peculiar gratification. This butter is made of the fruit of the

shea-tree, which is not unlike a Spanish olive, and has a kernel from which the butter is extracted by boiling. It is in great repute, having a richer taste than the butter of milk, and keeping for a long time without salt, which is very expensive in Africa. After breakfast we took leave of our kind host and his family, and returned in the same way we came.

The foregoing description of semi-barbarous life may seem to portray it in some attractive colours, so that indolent and licentious persons might ask: Is it not preferable to our sophisticated state of society? We are not judges of other people's taste, but we can see in it nothing desirable. Its evils are numerous and very great. It is a dearth or death of the soul, and of all that which truly constitutes man an intelligent being, aiming at mental progress. Again, it is intimately connected with a state of slavery, with the degradation of females, and with polygamy—three great moral evils, the sources of endless rapine, injustice, and misery. Famine also frequently prevails, and is a dreadful scourge, even compelling mothers to sell some of their children that they may save the rest. For in such an uncertain state of society, no one cares to lay up for the future, as his hordes would only incur the greater risk of being pillaged and destroyed.

THE COMMERCIAL PORTS OF ENGLAND.

A return has just been made, by order of parliament, which shews that Liverpool is now the greatest port in the British Empire in the value of its exports and the extent of its foreign commerce. Being the first port in the British Empire, it is the first port in the world. New York is the only place out of Great Britain which can at all compare with the extent of its commerce. New York is the Liverpool of America, as Liverpool is the New York of Europe. The trade of those two ports is reciprocal. The raw produce of America, shipped in New York, forms the mass of the imports of Liverpool; the manufactures of England, shipped at Liverpool, form the mass of the imports of New York. The two ports are, together, the gates or doors of entry between the Old World and the New. On examining the return just made, it appears that the value of the exports of Liverpool in the year 1850 amounted to nearly £35,000,000 sterling (£34,891,847), or considerably more than one-half of the total value of the exports of the three kingdoms for that year. This wonderful export-trade of Liverpool is partly the result of the great mineral riches of Lancashire, Cheshire, Staffordshire, Warwickshire, and the West Riding of Yorkshire; partly of the matchless ingenuity and untiring industry of the populations of those counties; partly of a multitude of canals and railways, spreading from Liverpool to all parts of England and the richest parts of Wales; partly to Liverpool, being the commercial centre of the three kingdoms; and partly to the fact that very nearly £12,000,000 have been expended in Liverpool, and more than £12,000,000 in the river Mersey, in converting a stormy estuary and an unsafe anchorage into the most perfect port ever formed by the skill of man. On comparing the respective amounts of the tonnage of Liverpool and London, it appears at first impossible to account for the fact that the shipping of Liverpool is rather less than that of London, while its export-trade is much more than twice as great. The explanation of this fact is, that the vessels employed in carrying the million or million and a half of tons of coal used in London, appear in the London return; while the canal and river flats, to say nothing of the railway trains, employed in carrying the million and a quarter of tons of coal used or employed in Liverpool, do not. State the case fairly, and the maritime superiority of Liverpool will be found to be as decided as is its commercial. We ought also to add, that while the Custom-house returns for 1850 give Liverpool only 3,262,253 tons of shipping, the payment of rates to the Liverpool Dock Estate in the twelve months ending June 25, 1851, gives 3,737,666 tons, or nearly

500,000 tons more. Comparing the rate of increase of the exports of Liverpool with that of other ports, it appears that Liverpool is not only the first port in the kingdom, but that it is becoming more decidedly the first every year. During the last five years the increase of the exports of Liverpool has been from 26,000,000 to nearly 35,000,000, while that of London has been from little less than 11,000,000 to rather more than 14,000,000. The exports of Hull—which is undoubtedly the third port of the kingdom—though still very large, have rather declined, having been L.10,875,870 in 1846, and not more than L.10,366,610 in 1850. The exports of Glasgow, now the fourth port of the empire, shew a fair increase, from L.3,024,343 to L.3,768,646. No other port now sends out exports of the value of L.2,000,000 a year, though Southampton comes near to L.2,000,000, and Cork passes L.1,000,000.—*Liverpool Times*.

AN UNFORTUNATE MAN.

I am fallen into the hands of publicans and sequestrators, and they have taken all from me. What now? Let me look about me. They have left me sun and moon, fire and water, a loving wife, and many friends to pity me, and some to relieve me; and I can still discourse; and, unless I list, they have not taken away my merry countenance and my cheerful spirits, and a good conscience; they have still left me the providence of God, and all the promises of the gospel, and my religion, and my hope of heaven, and my charity to them too. And still I sleep, and digest, and eat, and drink; I read and meditate; I can walk in my neighbour's pleasant fields, and see the varieties of natural beauty, and delight in all that in which God delights—that is, in virtue and wisdom, in the whole creation, and in God himself.—*Jeremy Taylor*.

SLOW BUT SURE.

Some years ago a man was apprehended in Hampshire, charged with a capital offence—sheep-stealing, I believe. After being examined before a justice of the peace, he was committed to the county jail at Winchester for trial at the ensuing assizes. The evidence against the man was too strong to admit of any doubt of his guilt; he was consequently convicted, and sentence of death—rigidly enforced for this crime at the period alluded to—pronounced. Months and years passed away, but no warrant for his execution arrived. In the interval a marked improvement in the man's conduct and bearing became apparent. His natural abilities were good, his temper mild, and his general desire to please attracted the attention and engaged the confidence of the governor of the prison, who at length employed him as a domestic servant; and such was his reliance on his integrity that he even employed him in executing commissions, not only in the city, but to places at a great distance from it. After a considerable lapse of time, however, the awful instrument, which had been inadvertently concealed among other papers, was discovered, and at once forwarded to the high-sheriff, and by the proper authority to the unfortunate delinquent himself. My purpose is brief relation only; suffice it to say, the unhappy man is stated under these affecting circumstances to have suffered the last penalty of the law.—*Notes and Queries*.

THE SEA-KINGS OF NANTUCKET.

Let America add Mexico to Texas, and pile Cuba upon Canada; let the English overwarm all India, and hang out their blazing banner from the sun; two-thirds of this terraqueous globe are the Nantucketer's. For the sea is his—he owns it as emperors own empires, other seamen having but a right to pass through it. Merchant-ships are but extension bridges; armed ones but floating forts; even pirates and privateers, though following the sea as highwaymen the road, they but plunder other ships, other fragments of the land like themselves, without seeking to draw their living from the bottomless sea itself. The Nantucketer, he alone resides and riots on the sea; he alone, in Bible language, goes down to it in ships; to

and fro ploughing it as his own special plantation. *There* is his home; *there* lies his business; which a Noah's flood would scarcely interrupt, though it overwhelmed all the millions in China. He lives on the sea as prairie cocks in the prairie; he hides among the waves; he climbs them as chamois hunters climb the Alps. For years he knows not the land; so that when he comes to it at last, it smells like another world, more strangely than the moon would to an earthsman. With the landless gull, that at sunset folds her wings and is rocked to sleep between billows, so at nightfall the Nantucketer, out of sight of land, furls his sails, and lays him to his rest, while under his very pillow rush herds of walruses and whales.—*Herman Melville's The Whale*.

THE LINNÆA BOREALIS.

'Linnæ selected a tiny wild-flower that he discovered, of exquisite beauty and delicious odour, to bear his name—one that refuses to exchange the silent glen and melancholy wood for the more gay parterres of horticulture.'—*Rambles in Sweden and Gotland, by Sylvanus*.

'Tis a child of the old green woodlands,
Where the song of the free wild bird,
And swaying of boughs in the summer breeze,
Are the only voices heard.

In the richest moss of the lonely dells
Are its rosy petals found,
With the clear blue skies above it spread,
And the lordly trees around.

In those still, untrodden solitudes
Its lovely days are passed;
And the sunny turf is its fragrant bier
When it gently dies at last.

But if from its own sweet dwelling-place
By a careless hand 'tis torn,
And to hot and dusty city streets
In its drooping beauty borne,

Its graceful head is with sorrow bowed,
And it quickly pines and fades;
Till the fragile bloom is for ever fled
That gladdened the forest glades.

It will not dwell 'neath a palace dome,
With rare exotic flowers,
Whose perfumed splendour gaily gleams
In radiant festal hours:

It loves not the Parian marble vase,
On the terrace fair and wide;
Or the bright and sheltered garden bowers
Smiling in gorgeous pride.

But it mourns for the far-off dingles,
For their fresh and joyous air,
For the dewy sighs and sunny beams
That lingered o'er it there.

O lonely and lovely forest-flower!
A holy lot is thine,
Amid nature's deepest solitudes,
With radiance meek to shine.

Bright blossom of the shady woods!
Live on in your cool retreat,
Unharm'd by the touch of human hand,
Or the tread of careless feet;

With the rich green fern around your home,
The birds' glad song above,
And the solemn stars in the still night-time
Looking down with eyes of love!

THE LOST AGES.

My friends, have you read *Elia*? If so, follow me, walking in the shadow of his mild presence, while I recount to you my vision of the Lost Ages. I am neither single nor unblessed with offspring, yet, like Charles Lamb, I have had my 'dream-children.' Years have flown over me since I stood a bride at the altar. My eyes are dim and failing, and my hairs are silver-white. My real children of flesh and blood have become substantial men and women, carving their own fortunes, and catering for their own tastes in the matter of wives and husbands, leaving their old mother, as nature ordereth, to the stillness and repose fitted for her years. Understand, this is not meant to imply that the fosterer of their babyhood, the instructor of their childhood, the guide of their youth, is forsaken or neglected by those who have sprung up to maturity beneath her eye. No; I am blessed in my children. Living apart, I yet see them often; their joys, their cares are mine. Not a Sabbath dawns but it finds me in the midst of them; not a holiday or a festival of any kind is noted in the calendar of their lives, but Grand-mamma is the first to be sent for. Still, of necessity, I pass much of my time alone; and old age is given to reverie quite as much as youth. I can remember a time—long, long ago—when in the twilight of a summer evening it was a luxury to sit apart with closed eyes; and, heedless of the talk that went on in the social circle from which I was withdrawn, indulge in all sorts of fanciful visions. Then my dream-people were all full-grown men and women. I do not recollect that I ever thought about children until I possessed some of my own. Those waking visions were very sweet—sweeter than the realities of life that followed; but they were neither half so curious nor half so wonderful as the dreams that sometimes haunt me now. The imagination of the old is not less lively than that of the young: it is only less original. A youthful fancy will create more new images; the mind of age requires materials to build with: these supplied, the combinations it is capable of forming are endless. And so were born my dream-children.

Has it never occurred to you, mothers and fathers, to wonder what has become of your children's lost ages? Look at your little boy of five years old. Is he at all, in any respect, the same breathing creature that you beheld three years back? I think not. Whither, then, has the sprite vanished? In some hidden fairy nook, in some mysterious cloud-land he must exist still. Again, in your slim-formed girl of eight years, you look in vain for the sturdy elf of five. Gone? No; that cannot be—'a thing of beauty is a

joy for ever.' Close your eyes: you have her there! A breeze-like, sportive, buoyant thing; a thing of breathing, laughing, unmistakable life; she is mirrored on your retina as plainly as ever was dancing sunbeam on a brook. The very trick of her lip—of her eye; the mischief-smile, the sidelong saucy glance,

'That seems to say,
I know you love me, Mr Grey.'

is it not traced there—all, every line, as clear as when it brightened the atmosphere about you in the days that are no more? To be sure it is; and being so, the thing must exist—somewhere.

I never was more fully possessed with this conviction than once during the winter of last year. It was Christmas-eve. I was sitting alone, in my old arm-chair, and had been looking forward to the fast-coming festival-day with many mingled thoughts—some tender, but regretful; others hopeful, yet sad; some serious, and even solemn. As I laid my head back and sat thus with closed eyes, listening to the church-clock as it struck the hour, I could not but feel that I was passing—very slowly and gently it is true—towards a time when the closing of the grave would shut out even that sound so familiar to my ear; and when other and more precious sounds of life—human voices, dearer than all else, would cease to have any meanings for me—and even their very echoes be hushed in the silence of the one long sleep. Following the train of association, it was natural that I should recur to the hour when that same church's bells had chimed my wedding-peal. I seemed to hear their music once again; and other music sweeter still—the music of young vows that 'kept the word of promise to the ear, and broke it' not 'to the hope.' Next in succession came the recollection of my children. I seemed to lose sight of their present identity, and to be carried away in thought to times and scenes far back in my long-departed youth, when they were growing up around my knees—beautiful forms of all ages, from the tender nursing of a single year springing with outstretched arms into my bosom, to the somewhat rough but ingenious boy of ten. As my inner eye traced their different outlines, and followed them in their graceful growth from year to year, my heart was seized with a sudden and irresistible longing to hold fast these beloved but passing images of the brain. What joy, I thought, would it be to transfix the matchless beauty which had wrought itself thus into the visions of my old age! to preserve for ever, unchanging, every varied phase of that material but marvellous structure which the glorious human soul had animated and informed through all its progressive stages from the child to the man!

Scarcely was the thought framed when a dull, heavy weight seemed to press upon my closed eyelids. I now saw more clearly even than before my children's images in the different stages of their being. But I saw these, and these alone, as they stood rooted to the ground, with a stony fixedness in their eyes: every other object grew dim before me. The living faces and full-grown forms which until now had mingled with and played their part among my younger phantoms, altogether disappeared. I had no longer any eyes, any soul, but for this my new spectre-world. Life, and the things of life, had lost their interest; and I knew of nothing, conceived of nothing, but those still, inanimate forms from which the informing soul had long since passed away.

And now that the longing of my heart was answered, was I satisfied? For a time I gazed, and drew a deep delight from the gratification of my vain and impious craving. But at length the still, cold presence of forms no longer of this earth began to oppress me. I grew cold and numb beneath their moveless aspect; and constant gazing upon eyes lighted up by no varying expression, pressed upon my tired senses with a more than nightmare weight. I felt a sort of dull stagnation through every limb, which held me bound where I sat, pulseless and moveless as the phantoms on which I gazed.

As I wrestled with the feeling that oppressed me, striving in vain to break the bonds of that strange fascination, under the pressure of which I surely felt that I must perish—a soft voice, proceeding from whence I knew not, broke upon my ear. 'You have your desire,' it said gently; 'why, then, struggle thus? Why writhe under the magic of that joy you have yourself called up? Are they not here before you, the Lost Ages whose beauty and whose grace you would perpetuate? What would you more? O mortal!'

'But these forms have no life,' I gasped—'no pulsating, breathing soul!'

'No,' replied the same still, soft voice; 'these forms belong to the things of the past. In God's good time they breathed the breath of life; they had *then* a being and a purpose on this earth. Their day has departed—their work is done.'

So saying, the voice grew still: the leaden weight which had pressed upon my eyelids was lifted off: I awoke.

Filled with reveries of the past—my eyes closed to everything without—sleep had indeed overtaken me as I sat listening to the old church-clock. But my vision was not all a vision: my dream-children came not without their teaching. If they had been called up in folly, yet in their going did they leave behind a lesson of wisdom.

The morning dawned—the blessed Christmas-morning! With it came my good and dutiful, my real life-children. When they were all assembled round me, and when, subdued and thoughtful beneath the tender and gracious associations of the day, each in turn ministered, reverently and lovingly, to the old mother's need of body and of soul, my heart was melted within me. Blessed, indeed, was I in a lot full to overflowing of all the good gifts which a wise and merciful Maker could lavish upon his erring and craving creature. I stood reproved. I felt humbled to think that I should ever for a moment have indulged one idle or restless longing for the restoration of that past which had done its appointed work, and out of which so gracious a present had arisen. One idea impressed me strongly: I could not but feel that had the craving of my soul been answered in reality, as my dream had foreshadowed; and had the wise and beneficent order of nature been disturbed and distorted from its just relations, how fearful would have been the result! Here, in my green old age, I stood amongst a new generation, honoured for what I was, beloved for what

I had been. What if, at some mortal wish in some freak of nature, the form which I now bore were for ever to remain before the eyes of my children! Were such a thing to befall, how would their souls ever be lifted upward to the contemplation of that higher state of being into which it is my hope soon to pass when the hand which guided me hither shall beckon me hence? At the thought my heart was chastened. Never since that night have I indulged in any one wish framed in opposition to nature's laws. Now I find my dream-children in the present; and to the past I yield willingly all things which are its own—among the rest, the Lost Ages.

STORY OF GASPARD MENDEZ.

BY CATHERINE CROWE.

THE extraordinary motives under which people occasionally act, and the strange things they do under the influence of these motives, frequently so far transcend the bounds of probability, that we romance-writers, with the wholesome fear of the critics before our eyes, would not dare to venture on them. Only the other day we read in the newspapers that a Frenchman who had been guilty of embezzlement, and was afraid of being found out, went into a theatre in Lyon and stabbed a young woman whom he had never seen before in his life, in order that he might die by the hands of the executioner, and so escape the inconvenience of rushing into the other world without having time to make his peace with Heaven. He desired death as a refuge from the anguish of mind he was suffering; but instead of killing himself he killed somebody else, because the law would allow him leisure for repentance before it inflicted the penalty of his crime.

It will be said the man was mad—I suppose he was; and so is everybody whilst under the influence of an absorbing passion, whether the mania be love, jealousy, fanaticism, or revenge. The following tale will illustrate one phase of such a madness.

In the year 1789, there resided in Italy, not far from Aquila in the Abruzzo, a man called Gaspar Mendez. He appears to have been a Spaniard, if not actually by birth, at least by descent, and to have possessed a small estate, which he rendered valuable by pasturing cattle. Not far from where he resided there lived with her parents a remarkably handsome girl, of the name of Bianca Venoni, and on this fair damsel Mendez fixed his affections. As he was by many degrees the best match about the neighbourhood, he never doubted that his addresses would be received with a warm welcome, and intoxicated with this security, he seems to have made his advances so abruptly that the girl felt herself entitled to give him an equally abrupt refusal. To aggravate his mortification, he discovered that a young man, called Giuseppe Ripa, had been a secret witness to the rejection, which took place in an orchard; and as he walked away with rage in his heart, he heard echoing behind him the merry laugh of the two thoughtless young people. Proud and revengeful by nature, this affront seems to have rankled dreadfully in the mind of Gaspar; although, in accordance with that pride, he endeavoured to conceal his feelings under a show of indifference. Those who knew the parties well, however, were not deceived; and when, after an interval, it was discovered that Giuseppe himself was the favoured lover of Bianca, the enmity, though not more open, became more intense than ever.

In the meantime old Venoni, Bianca's father, had become aware of the fine match his daughter had missed, and was extremely angry about it; more particularly as he was poor, and would have been very much pleased to have a rich son-in-law. Nor was he disposed to relinquish the chance so easily. After first trying his influence on Bianca, upon whom he expended a great deal of persuasion and cajolery in

vain, he went so far as to call upon Gaspar, apologising for his daughter's ignorance and folly in refusing so desirable a proposal, and expressing a hope that Mendez would not relinquish the pursuit, but try his fortune again; when he hoped to have brought her to a better state of mind.

Gaspar received the old man with civility, but answered coldly, that any further advances on his own part were out of the question, unless he had reason to believe the young lady was inclined to retract her refusal; in which case he should be happy to wait upon her. With this response Venoni returned to make another attack upon his daughter, whom, however, fortified by her strong attachment to Ripa, he found quite immovable; and there for several months the affair seems to have rested, till the old man, urged by the embarrassment of his circumstances, renewed the persecution, coupling it with certain calumnies against Giuseppe, founded on the accidental loss of a sum of money which had been intrusted to him by a friend, who wanted it conveyed to a neighbouring village, whither the young man had occasion to go. This loss, which seems to have arisen out of some youthful imprudence, appears to have occasioned Ripa a great deal of distress; and he not only did his utmost to repair it by giving up everything he had, which was indeed very little, but he also engaged to pay regularly a portion of his weekly earnings till the whole sum was replaced.

His behaviour, in short, was so satisfactory, that the person to whom the money had belonged does not seem to have borne him any ill-will on the subject; but Venoni took advantage of the circumstance to fling aspersions on the young man's character, whilst it strengthened his argument against the connection with his daughter; for how was Giuseppe to maintain a wife and family with this millstone of debt round his neck? Bianca, however, continued faithful to her lover, and for some time nothing happened to advance the suit of either party. In that interval a sister of Gaspar's had married a man called Alessandro Malfi, who, being a friend of Giuseppe's, endeavoured to bring about a reconciliation betwixt the rivals, or, rather, to produce a more cordial feeling, for there had never been a quarrel; and as far as Ripa was concerned, as he had no cause for jealousy, there was no reason why he should bear ill-will to the unsuccessful candidate. With Gaspar it was different: he hated Ripa; but as it hurt his pride that this enmity to one whom he considered so far beneath him should be known, he made no open demonstration of dislike, and when Malfi expressed a wish to invite his friend to supper, hoping that Mendez would not refuse to meet him, the Spaniard made no objection whatever. 'Why not?' he said: 'he knew of no reason why he should not meet Giuseppe Ripa, or any other person his brother-in-law chose to invite.'

Accordingly the party was made; and on the night appointed Giuseppe, after a private interview in the orchard with his mistress, started for Malfi's house, which was situated about three miles off, in the same direction as Gaspar's, which, indeed, he had to pass; on which account he deferred his departure to a later hour than he otherwise would have done, wishing not to come in contact with his rival till they met under Malfi's roof. Mendez had a servant called Antonio Guerra, who worked on his farm, and who appears to have been much in his confidence, and just as Ripa passed the Spaniard's door, he met Guerra coming in an opposite direction, and asked him if Mendez had gone to the supper yet; to which Guerra answered that he supposed he had, but he did not know. Guerra then took a key out of his pocket, and, unlocking the door, entered the house, whilst Ripa walked on.

In the meanwhile the little party had assembled in Malfi's parlour, all but the two principal personages,

Gaspar and Giuseppe; and as time advanced without their appearing, some jests were passed amongst the men present, who wished they might not have fallen foul of each other on the way. At length, however, Ripa arrived, and the first question that was put to him was: 'What had he done with his rival?' which he answered by inquiring if the Spaniard was not come. But although he endeavoured to appear unconcerned, there was a tremor in his voice and a confusion of manner that excited general observation. He made violent efforts, however, to appear at his ease, but these efforts were too manifest to be successful; whilst the continued absence of Mendez became so unaccountable, that a cloud seems to have settled on the spirits of the company, which made the expected festivity pass very heavily off.

'Where could Mendez be? What could have detained him? It was to be hoped no harm had happened to him!' Such was the burden of the conversation till—when at about an hour before midnight the party broke up—Alessandro Malfi said, that to allay the anxiety of his wife, who was getting extremely alarmed about her brother, he would walk as far as Forni—which was the name of Gaspar's farm—to inquire what had become of him.

As Ripa's way lay in the same direction, they naturally started together; and after what appears to have been a very silent walk—for the spirits of Giuseppe were so depressed that the other found it impossible to draw him into conversation—they reached Forni, when, having rung the bell, they were presently answered by Antonio Guerra, who put his head out of an upper window to inquire who they were, and what they wanted.

'It is I, Alessandro Malfi. I want to know where your master is, and why he has not been to my house this evening as he promised?'

'I thought he was there,' said Antonio. 'He set off from here to go soon after seven o'clock.'

'That is most extraordinary!' returned Malfi. 'What in the world can have become of him?'

'It is very strange, certainly,' answered the servant. 'He has never come home; and when you rang I thought it was he returned from the party.'

As there was no more to be learned, the two friends now parted; Malfi expressing considerable surprise and some uneasiness at the non-appearance of his brother-in-law: whilst of Giuseppe we hear nothing more till the following afternoon, when, whilst at work in his vineyard, he was accosted by two officers of justice from Aquila, and he found himself arrested, under an accusation of having waylaid Mendez in a mountain-pass on the preceding evening, and wounded him with the design of taking his life.

The first words Ripa uttered on hearing this impeachment—words that, like all the rest of his behaviour, told dreadfully against him—were: 'Isn't he dead, then?'

'No thanks to you that he's not,' replied the officer; 'but he's alive, and likely to recover to give evidence against his assassin.'

'Dio!' cried Giuseppe, 'I wish I'd known he wasn't dead!'

'You confess, then, that you wounded him with the intent to kill?'

'No,' answered Ripa; 'I confess no such thing. As I was going through the pass last night I observed a man's hat lying a little off the road, and on lifting it, I saw it belonged to Señor Mendez. Whilst I was wondering how it came there without the owner, and was looking about for him, I spied him lying behind a boulder. At first I thought he was asleep, but on looking again, I saw he didn't lie like a sleeping man, and I concluded he was dead. Had it been any one but he, I should have lifted him up; but it being very well known that we were no friends, I own I was afraid to

do so. I thought it better not to meddle with him at all. However, if he is alive, as you say, perhaps he can tell himself who wounded him.'

'To be sure he can,' returned the officer: 'he says it's you!'

'*Perduto son' io!*—Then I am lost!' exclaimed Ripa; who, on being brought before the authorities, persisted in the same story; adding, that so far from seeking Mendez, he had particularly wished to avoid him, and that that was the reason he had started so late; for he had been warned that the Spaniard was his enemy, and he apprehended that if they met alone some collision might ensue.

It appeared, however, that he had consumed much more time on the road than could be fairly accounted for; for two or three people had met him on the way before he reached Forni; and then Antonio Guerra could speak as to the exact hour of his passing. This discrepancy he attempted to explain by saying, that after seeing Mendez on the ground, dead—as he believed—he had been so agitated and alarmed that he did not like to present himself at Malfi's house, lest he should excite observation. He had also spent some time in deliberating whether or not he should mention what he had seen; and he had made up his mind to do so on his arrival, but was deterred by everybody's asking him, when he entered the room, what he had done with Mendez—a question that seemed to imply a suspicion against himself.

This tale, of course, was not believed: indeed his whole demeanour on the night in question tended strongly to his condemnation; added to which, Malfi, who had been his friend, testified that not only had Ripa betrayed all the confusion of guilt during the walk from his house to Forni, but that having hold of his arm, he had distinctly felt him tremble as they passed the spot where Mendez was subsequently discovered.

With regard to Mendez himself, it appeared that when found he was in a state of insensibility, and he was still too weak to give evidence or enter into any particulars; but when, under proper remedies, he had recovered his senses, Faustina Malfi, his sister—to whose house he had been carried—asked him if Giuseppe Ripa was not the assassin; and he answered in the affirmative.

Giuseppe was thrown into prison to await his trial; and having public opinion, as well as that of the authorities against him, he was universally considered a dead man. The only person that adhered to him was Bianca, who visited him in the jail, and refused to believe him guilty. But if he was innocent, who was the criminal? It appeared afterwards that Ripa himself had his own suspicions on that subject, but as they were founded only on two slight indications, he felt it was useless to advance them.

In the meantime Gaspar Mendez was slowly recovering the injuries he had received, and was of course expected to give a more explanatory account of what had happened to him after he left Forni on his way to Alessandro Malfi's. That he had been robbed as well as wounded was already known—his brother and sister having found his pockets empty and his watch gone. The explanation he could give, however, proved to be very scanty. Indeed, he seemed to know very little about the matter, but he still adhered to his first assertion, that Ripa was the assassin. With regard to the money he had lost, there was necessarily less mystery, since it consisted of a sum that he was carrying to his sister, and was indeed her property, being the half share of some rents which he had received on that morning, the produce of two houses in the town of Aquila which had been bequeathed to them conjointly by their mother. The money was in a canvas bag, and the other half which belonged to himself he had left locked in his strong box at home,

where, on searching for it, it was found. As Ripa was known to be poor, and very much straitened by his endeavours to make good the sum he had lost, that he should add robbery to assassination was not to be wondered at. On the contrary, it strengthened the conviction of his guilt, by supplying an additional motive for the crime.

The injuries having been severe, it was some time before Mendez recovered sufficiently to return home; and when he was well enough to move, instead of going to Forni, he discharged his servant Antonio Guerra, and went himself to Florence, where he remained several months.

All this time Giuseppe Ripa was in prison, condemned to die, but not executed; because after his trial and sentence, a letter had been received by the chief person in authority, warning him against shedding the blood of the innocent. 'Señor Mendez is mistaken,' the letter said: 'he did not see the assassin, who attacked him from behind, and Giuseppe Ripa is not guilty.'

This judge, whose name was Marino, appears to have been a just man, and to have felt some dissatisfaction with the evidence against Ripa; inasmuch as Mendez, who, when first questioned, had spoken confidently as to his identity, had since faltered when he came to give his evidence in public, and seemed unable to afford any positive testimony on the subject. The presumption against the prisoner, without the evidence of the Spaniard, was considered by the other judges strong enough to convict him; but Marino had objected that since the attack was made by daylight—for it was in the summer, and the evenings were quite light—it seemed extraordinary that Mendez could give no more certain indications of his assailant. Added to this, although every means had been used to obtain a confession—such means as are permitted on the continent, but illegal in this country—Giuseppe persisted in his innocence. Moreover, as no money had been found about him, and Faustina Malfi was exceedingly desirous of recovering what had been lost, she exerted herself to obtain mercy to at least the extent that hopes of a commutation of his sentence should be held out to the prisoner, provided he would reveal where he had concealed the bagful of silver he had taken from her brother. But in vain. Ripa was either guiltless or obstinate, for nothing could be extracted from him but repeated declarations of his innocence.

In the meantime Bianca had been undergoing a terrible persecution from her father on the subject of Mendez, who had returned from Florence and taken up his abode, as formerly, at Forni. Her former lover was a condemned man, and altogether *hors de combat*: she might regret him as she would, and lament his fate to her heart's content, but he could never be her husband; and there was the Spaniard, rich and ready; whilst the increasing age and poverty of her parent rendered a good match of the greatest importance. In short, under the circumstances of the case, it was urged upon her on all hands, that she was bound both by her duty to her father and to evince her abhorrence of Ripa's crime—which otherwise it might be supposed she had instigated—to marry Mendez without delay.

Persuaded of Giuseppe's innocence, and half believing that the accusation was prompted by jealousy, it may be imagined how unwelcome these importunities were, and for a considerable time she resisted them; indeed she seems only to have been overcome at last by a ruse. A rumour being set afloat that the day was about to be appointed for Ripa's execution, a hint was thrown out that it lay in her power to save his life: she had only to become the wife of Mendez, and her lover's sentence should be commuted from death to banishment. This last argument prevailed, and poor Bianca, with a heavy heart, consented to become the mistress of Forni. The Malfis, however, do not seem to have

been amongst those who desired the match; and it would appear that they even made some attempts to prevent its taking place, by circulating a report that she had been privy to the assault and robbery. Perhaps they hoped, if Gaspar remained unmarried, to inherit his property themselves; but however that may be, their opposition was of no avail, and an early period was fixed for the wedding.

The year had now come round to the summer season again, and it happened, by mere accident, that the day appointed for the marriage was the anniversary of that on which Mendez had been robbed and wounded. Nobody, however, appears to have thought of this coincidence, till Mendez himself, observing the day of the month, requested that the ceremony might be postponed till the day after: 'Because,' said he, 'I have business which will take me to Aquila on the 7th, so the marriage had better take place on the 8th.' And thus it was arranged.

This alteration was made about ten days before the appointed period, and nothing seems to have occurred in the interval worth recording, except that as the hour of sacrifice drew nigh, the unwillingness of the victim became more evident. We must conclude, however, that Mendez, whose object in marrying her appears to have been fully as much the soothing of his pride as the gratification of his love, was not influenced by her disinclination, for when he started for Aquila on the 7th, every preparation had been made for the wedding on the following day.

The object of his journey was to receive the rents before named, which became due at this period, and also to purchase a wedding-present for his bride. On this occasion Alessandro Malfi was to have accompanied him; but when Mendez stopped at his door to inquire if he was ready, Malfi came down stairs half-dressed, saying that he had been up all night with his wife, who was ill, and that as she had now fallen asleep, he was going to lie down himself, and try to get a little rest. This occurred early in the morning; and Mendez rode on, saying that he should call as he came back in the evening, to inquire how his sister was. Upon this Malfi went to bed, where he remained some hours—indeed till he received a message from his wife, begging him to go to her. When he entered the room, the first question she asked was whether Gaspar was gone to Aquila; and on being told that he was, she said she was very sorry for it, for that she had dreamed she saw a man with a mask lying in wait to rob him.

'I saw the man as distinctly as possible,' she said, 'but I could not see his face for the mask; and I saw the place, so that I'm sure if I were taken there I should recognise it.'

Her husband told her not to mind her dreams, and that this one was doubtless suggested by the circumstance that had occurred the year before. 'But,' said he, 'Ripa's safely locked up in jail now, and there's no danger.'

Nevertheless the dream appears to have made so deep an impression on the sick woman's fancy, that she never let her husband rest till he promised to go with his own farm-servant to meet her brother—a compliance which was at length won from him by her saying that she had seen the man crouching behind a low wall that surrounded a half-built church; 'and close by,' she added, 'there was a direction-post with something written on it, but I could not read what it was.'

Now it happened that on the horse-road to Aquila, which Faustina herself had never travelled, there was exactly such a spot as that she described. Malfi knew it well. Struck by the circumstance, he desired to have his dinner immediately, and then, accompanied by his kind, he set off to meet Gaspar.

In the meanwhile the Spaniard had got his money and made his purchases in good time, not wishing to be

late on the road, so that they had scarcely got a mile beyond the church when they met him; and in answer to his inquiries what had brought them there, Malfi related his wife's dream, adding that he might have spared himself the ride, for he had looked over the wall, and saw nobody there. 'I told her it was nonsense,' he said, 'whilst we know your enemy's under such good keeping at Aquila; but she wouldn't be satisfied till I came.'

Mendez, however, appeared exceedingly struck with the dream, inquired the particulars more in detail, and asked if they were sure there was nobody concealed in the place Faustina indicated. Malfi answered that he did not alight, but he looked over the wall and saw nobody. During the course of this conversation they had turned their horses' heads, and were riding back towards the church, Malfi talking about Ripa's affair, remarking on the impropriety of deferring his execution so long; Mendez more than usually silent and serious, and the servant riding beside them, when, as they approached the spot, they saw coming towards them on foot a man, whom they all three recognised as Antonio Guerra, the Spaniard's late servant. As this person was supposed to have gone to another part of the country after quitting Gaspar's service, Malfi expressed some surprise at seeing him; whilst Mendez turned very pale, making at the same time some exclamation that attracted the attention of his brother-in-law, who, however, drew up his horse to ask Guerra what had brought him back, and if he was out of a situation, adding that a neighbour of his, whom he named, was in want of a servant. Guerra, who looked poorly dressed, and by no means in such good case as formerly, answered that he should be very glad if Malfi would recommend him.

'You had better turn about, then, and come on with us,' said Malfi, as he rode forward. During this conversation Mendez had sat by saying nothing; and if he was grave and silent before, he was still more so now, inasmuch that his behaviour drew the attention of his brother-in-law, who asked him if there was anything wrong with him.

'Surely it's not Faustina's dream you are thinking of?' he said; adding, 'that the meeting with Guerra had put it out of his head, or he would have examined the place more narrowly.'

Mendez entered into no explanation; and as the servant, who was acquainted with Guerra, took him up behind him, they all arrived at their journey's end nearly together: Mendez, instead of proceeding homewards, turning off with the others to Malfi's house, where the first thing he did after his arrival was to visit his sister, whom he found better; whilst she, on the contrary, was struck with the pallor of his features and the agitation of his manner—a disorder which, like her husband, she attributed to the shock of her dream, acting upon a mind prepared by the affair of the preceding year to take alarm. In order to remove the impression, she laughed at the fright she had been in; but it was evident he could not share her merriment, and he quickly left her, saying he had a message to send to Rocca, which was the village where Bianca and her father resided, and that he must go below and write a note, which he did, giving it to Malfi's servant to take.

It appeared afterwards that this man, having other work in hand, gave the note to Guerra, who willingly undertook the commission, and who, to satisfy his own curiosity, broke the seal on the way, and possessed himself of its contents before he delivered it. These were, however, only a request that Bianca and her father would come over to Malfi's house that evening and bring the notary of the village with them, he (Mendez) being too tired to go to Rocca to sign the contract, as had been arranged.

It being between six and seven o'clock when this dispatch arrived, Bianca, who was very little inclined to sign the contract at all, objected to going; but her father insisting on her compliance, they set off in company with Guerra and the notary, who, according to appointment, was already in waiting. They had nearly three miles to go, and as Venoni had no horse, the notary gave Bianca a seat on his, and the old man rode double with Guerra.

When they arrived, Mendez was standing at the door waiting for them, accompanied by Malfi, his servant, a priest, and two or three other persons of the neighbourhood; some of whom advanced to assist Bianca and her father to alight, whilst the others surrounded Guerra as he set his foot on the ground, pinioning his arms and plunging their hands into his pockets, from whence they drew two small pistols and a black mask, such as was worn at the carnivals; besides these weapons, he carried a stiletto in his bosom.

Whilst the last comers were gazing with amazement at this unexpected scene, the new-made prisoner was led away to a place of security, and the company proceeded into the house, where the notary produced the contract and laid it on the table, inquiring at the same time what Guerra had done to be so treated.

Then Mendez rose, and taking hold of the contract, he tore it in two and flung it on the ground; at which sight Venoni started up with a cry, or rather a howl—an expression of rage and disappointment truly Italian, and of which no Englishman who has not heard it can have an idea.

'*Peccato! I have sinned!*' said the Spaniard haughtily; 'but I have made my confession to the padre; and why I have torn that paper my brother-in-law, Alessandro, will presently tell you!' He then offered his hand to Bianca, who, no less pleased than astonished to see the contract destroyed, willingly responded to this token of good-will by giving him hers, which he kissed, asking her pardon for any pain he had occasioned her; after which, bowing to the company, he quitted the room, mounted his horse, and rode off to Forni.

When the sound of the animal's feet had died away, and the parties concerned were sufficiently composed to listen to him, Malfi proceeded to make the communication he had been charged with; whereby it appeared that Ripa had been unjustly accused, and that Antonio Guerra was the real criminal. Mendez knew this very well, and would not have thought of accusing his rival had not his brother and sister, and indeed everybody else, assumed Ripa's guilt as an unquestionable fact. The temptation was too strong for him, and after he had once admitted it, pride would not allow him to retract. At the same time he declared that he would never have permitted the execution to take place, and that after the marriage with Bianca he intended to use every effort to procure the innocent man's liberation, on the condition of his quitting that part of the country. Of course it was he who wrote the letter to Marino, and he had used the precaution of placing a sealed packet, containing a confession of the truth, in the hands of a notary at Aquila, with strict directions to deliver it to Ripa if the authorities should appear disposed to carry his sentence into execution.

He had nevertheless suffered considerable qualms of conscience about the whole affair; and the moment he saw Guerra on the road that night, he felt certain that he had come with the intention of waylaying him as before—the man being well aware that it was on that day he usually received his rents. He perceived that he should never be safe as long as this villain was free, and that he must either henceforth live in continual terror of assassination, or confront the mortification of a confession whilst the fellow was in his power.

With respect to Guerra himself, he made but feeble

resistance when he was seized. He had, in the first instance, left Mendez for dead; and he would have immediately fled when he heard he was alive, had not the news been accompanied with the further information that the Spaniard had pointed out Ripa as his assailant. He was exceedingly surprised, for he could scarcely believe that he had not been recognised. Nevertheless it was possible; and whether it were so or not, he did not doubt that what Mendez had once asserted he would adhere to. On receiving his dismissal, he had gone to some distance from the scene of his crime; but having, whilst the money lasted, acquired habits of idleness and dissipation that could not be maintained without a further supply, these necessities had provoked this last enterprise.

He had really been concealed behind the wall when Malfi and his servant passed; but concluding that they were going to meet Mendez, and that his scheme was defeated, he had thought it both useless and dangerous to remain, and was intending to make off in another direction, when their sudden return surprised him.

A few hours more saw Antonio Guerra in Giuseppe Ripa's cell; and whilst the first paid the penalty of his crimes, the latter was rewarded for his sufferings by the hand of Bianca, to whom the Spaniard gave a small marriage-portion before finally quitting the country, which he did immediately after Antonio's trial.

Ripa said he had always had a strong persuasion that Guerra was the real criminal from two circumstances: the first was the hurried manner in which he was walking on the evening he met him at the gate of Forni, and some strange expression of countenance which he had afterwards recalled. The second was his answering them from the window when he and Malfi went to inquire for Mendez. If he thought it was his master, as he said, why had he not come down at once to admit him?

It is remarkable that the enmity of the Spaniard was not directed against the man that had aimed at his life, but against him who had wounded his pride.

INFLUENCES OF THE RAILWAY SYSTEM.

WHILE there are many machines which contribute much more directly to the rapid accumulation of wealth in the persons of individuals, than does the railway locomotive, there is probably none which tends more to enrich a community. Unlike most other mechanical contrivances for the abridgment of labour, the railway locomotive unites in the effects which it produces the elements of social as well as commercial improvement. Like the steamship, the railway is cosmopolitan in its character. The range of its operations may be as extensive as the globe itself; and throughout that sphere of activity, be it what it may, the locomotive engine is scattering thickly the seeds of civilisation, as well as of wealth.

By the application of steam as a motive agent an immense saving has been effected in the outlay required to be made in producing a given result in locomotion. This is the combined product of two causes. Such perfection has been attained in the construction of machinery, that by the aid of steam there can thence be obtained a continuity, combined with a rapidity of motion, which far exceeds what can be produced by any other means at present known to us. The fleetest racer equipped for speed alone, cannot equal, even for a single mile, the rate at which the locomotive engine, dragging after it a load of eighty tons, can, for hours together, be driven with ease and safety along its iron path. And this twofold result can be secured at a comparatively small cost. Coal, iron, wood—substances all to be easily obtained in nearly every quarter of the globe—can be, and daily are, fashioned into working agents not merely fleetest,

stronger, and more docile than any endowed with animal life, but agents likewise which it is far less costly to sustain in active usefulness. The food, medicines, and attention which animal life demands, form very serious items of expense in the case of beasts of burden, and so very materially impair their utility. It is otherwise with the locomotive engine. Money, ingenuity, and toil require undoubtedly to be expended in its original construction, attention and care must be given to avert or repair accident, and food of its own peculiar kind it does unquestionably consume; yet when all the original and working expenses of a locomotive are summed up, it is found that, compared with the income it produces, it is the cheapest of all motive agents.

No doubt the items of railway expenditure now mentioned do not nearly exhaust the amount of money required in their construction. In addition to expensive engines, there require carriages to be supplied for the transport of goods and passengers, houses and sheds to be built for their temporary accommodation, salaries to be paid for management and service; and in addition to all this, there must further be expended in the construction of the line itself sums far greater in amount than those spent in the formation and repair of roads and highways. All this is true; but in estimating the comparative costliness of the old and new methods of land-locomotion, regard must be had to the amount of their produce as well as of their outlay; and an opinion regarding their respective merits, in an economical point of view, must be formed by striking a balance between these two sides of the account. The result of such a comparison proves that in point of economy, not less than of speed and endurance, railways take precedence over all other known means of locomotion. This combined result of rapidity and cheapness of transit produces a double effect upon a mercantile community: it at once enables merchants to realise the fruits of a given speculation more quickly, which is nothing else than transacting more business in a shorter period than before; and it also enables them to do this increased amount of business with a smaller amount of actual outlay—that is, to extend with safety and profit the field of their operations beyond those boundaries which prudence formerly marked out as the proper limits of speculation.

When we consider the amount of travelling within the island which is requisite for carrying on the mercantile and general business of the country, and the double saving, therefore, of time on the one hand, and of money on the other, which is effected by means of railways, we cannot fail to perceive that even did this new system of locomotion economise time and labour in no other way than this alone, its effects upon commercial transactions and on business generally would be immense. But when we reflect that this system is exerting the very same influence upon trade—and in a much higher degree, so far as the outlay of money is concerned—in reference to the carriage of goods, as in regard to that of passengers, we then come to comprehend in some measure how fertile the railway locomotive is in the production of the fruits of industry.

Another commercial effect of the railway system has been to equalise the value of land, and promote the cultivation of those districts of a country which lie considerably removed from large towns. Every one knows that distance from market forms, as regards the cultivation of many vegetable and animal productions, a very serious drawback. Hence it arises that lands lying immediately around large cities bring a far larger price than portions of ground of equal extent and fertility would do situated at a greater distance. This is peculiarly the case with kitchen-gardens, and pasture-land suited for the purposes of fattening cattle, or feeding such as are required for the dairy. In all these cases, and others which might be mentioned, the

performance of a long journey affects very injuriously the quality and value of the several articles, and hence the demand for farms and fields not exposed to this drawback has naturally raised their value. Now railways, as they abridge space by means of speed, have had a tendency to increase the value of pasture and garden ground lying at, comparatively speaking, a very great distance around cities. It is now no unusual thing for the inhabitants of cities such as London, Liverpool, and Manchester, to use at breakfast milk or cream which has travelled thirty or forty miles the very morning it is consumed, and at dinner to partake of vegetables whose place of growth was more than a hundred miles removed from the stall at which they were sold.

The railway system has had a marked effect upon the state of the money-market of the commercial world in general, and of this country in particular. From the successful experiment made in 1830 in steam locomotion between Liverpool and Manchester, this new method of transit has been developing itself with a rapidity to which no parallel is to be found in the history of mercantile enterprise. Keeping out of view entirely the large sums which were recklessly squandered during the railway mania in mere gambling transactions and bubble schemes, there has been actually sunk in the construction and working of lines up to the present time more than £200,000,000 sterling. Before railways were called into existence, by far the larger portion of this enormous capital was divided into a great number of comparatively small sums, invested in a corresponding number of different speculations. From causes which it would be easy, but foreign to our present purpose, to explain, the profits arising from these various speculations were not only in the aggregate larger than those hitherto derived from railways, but the former speculations or investments being more temporary and convertible in their nature, secured to the parties engaging in them a far greater command over the capital employed in them. By diverting, as the railway system has done, so much money from the ordinary channels of mercantile enterprise, in which large profits were made, and—what is of more importance to the present remarks—when that money was well within the command and subject to the recall of its owners; and by taking, so to speak, and locking it up in a repository which could not be opened, the circulating medium of exchange soon became a scarce commodity to those who but lately had possessed it in abundance.

But it would be very false to infer because extensive bankruptcies, and periods of severe pecuniary embarrassment, have accompanied, if not indeed been caused by the development of the railway system, that therefore that system must be an unsound and unremunerative one. These monetary difficulties were in a great measure the consequence of over-speculation, and therefore form no sounder evidence against the utility of railways, than does over-speculation in tea condemn the prudent employment of capital in the tea-trade. Besides which, it must ever be remembered that the judiciousness of an undertaking is not always to be judged of by its immediate results. All investments of capital which are from their nature permanent, require time for the development of their effects, and may, as regards many of their immediate results, prove rather injurious than beneficial. To this class of speculations railways belong. Introduced for the purpose of facilitating locomotion, and thus improving the industry of the country, this new system of transit was calculated to produce rather an eventual and permanent, than an immediate benefit to the empire. So long as Great Britain retains and cultivates the resources of trade and manufactures now at her disposal, and provided no new method of locomotion be invented which shall supersede railways, there is every

reason to believe that railways will continue to form an ever-increasing source of wealth to the nation. That this is an opinion very generally entertained is proved from the vast sums of money which are now lent out on the faith that this result will be realised. The railway system has not only created a new field for speculation, but likewise a new security for monetary investments. At the close of 1848, upwards of £43,000,000 was lent upon railways. There is every reason to believe that debenture-holding is much greater now than it was then; but as no official report of its amount, so far as we know, has been published since 1848, we, for accuracy's sake, quote the return made in that year.

If railways have produced very important effects upon commercial affairs, they have exercised an influence not less important in a social and intellectual point of view. They have been greatly instrumental in removing prejudices, in cementing old and forming new friendships, in extending information, and in sharpening ingenuity.

Prejudice has been one of the most formidable obstacles to the spread of civilisation. It has for ages kept separate and at enmity nations born to bless and benefit each other; propped up systems whose graver errors or weaker absurdities now form subjects of regret and ridicule; and fomented among the members of smaller societies and sects discords, strifes, and recriminations, which have been based on no other foundation than wilful or accidental ignorance. By bringing those in contact who otherwise would never have met, and improving the acquaintance of those who have, railways have spread individual opinions, tastes, and information more equally than before; and out of this mixture of the social and moral elements have collected and more widely distributed just conclusions regarding men, manners, politics, and religion. By being thus more frequently brought together, individuals have increased the number of their acquaintances, and become to a greater extent than before 'citizens of the world.' A mutual discharge of the good offices of life has augmented those feelings of interest in our fellow-creatures, and kindness towards them, which are not less in accordance with the spirit of Christianity than conducive to the social wellbeing of communities.

The knowledge which one acquires by personal experience and observation is, generally speaking, much more valuable than that obtained from the written experience or observation of others. By the former method we obtain knowledge in a more rapid, accurate, and impressive manner; and, as a consequence of this, retain it longer in our memories, and possess a greater and more constant command over it. Books always convey a faint and imperfect, and often a very erroneous impression of things; and to the extent that railways have superseded or assisted book-teaching, have they conferred upon society an improved means of acquiring knowledge.

Through the instrumentality of railways also, an impetus has been imparted to the inventive and constructive faculties of the human mind. By being brought into more frequent contact with one another, individuals whose tastes and occupations are more or less similar are naturally led to form comparisons regarding the relative merits of their respective productions. This comparison has necessarily sharpened invention, improved taste, and suggested improvement. It is not too much to affirm, that there is not a single branch of industry now pursued within this country which has not, directly or indirectly, been benefited to an immense degree by the introduction of railways. Having served to bring into one market far more articles of commerce than before were exposed in it, this new mode of locomotion has to a great extent increased throughout our different trades and callings that

element of a generous and wholesome competition which is the most effective agent in eliciting a high degree of skill in the cultivation of an art, or the improvement of an invention.

To railways we are also indebted for a new application to practical usefulness of one of the most powerful elements in nature's laboratory: we refer to the employment of electricity in the transmission of thought. Although the wondrous powers and properties of the electric telegraph were known long before the introduction of the railway system, they were not till then made to minister, as they now do, to the information of man. By providing facilities towards laying and protecting the delicate machinery along which electricity was to perform its marvellous exploits, railways have directly contributed to apply and develop the resources of one of the most useful and wonderful of inventions, which even in its first stage of infancy has wrought a perfect revolution in the mode of transmitting intelligence; and which promises at no very distant day to play the same part among the continents and islands of the globe that it now does between the provinces of an empire.

THE LAST OF THE PALÆOLOGI.

It would be a curious historical problem to trace the families of emperors and kings, of heroes and conquerors, from the era of their decline and fall to their ultimate extinction. Some 'Old Mortality' might find as congenial employment in this field of sepulchral research as did the original in clearing up the decayed and moss-grown tombs of the Covenanters. The genealogist makes it his business rather to flatter the great by blazoning the antiquity of their pedigrees, than to teach the world a moral lesson on the instability of earthly grandeur, by chronicling their reverses. Yet the churchyard has its heraldry, from whose records wisdom might be extracted for the benefit of the living.

What dynasty in ancient times held a prouder or wider sway than the illustrious masters of the Roman world? The solid fabric of their power was the growth of nearly a thousand years, and it cost about thirteen centuries of revolutions and barbaric invasions before it was undermined and finally extinguished. If its earlier annals were disgraced by the crimes of a Tiberius, a Nero, and a Domitian, they could boast of the virtues and abilities of a Titus, a Trajan, a Nerva, a Hadrian, the two Antonini, &c.; though it must be admitted that latterly the balance sadly preponderated on the side of vice and corruption. If a Justinian or a Constantine appeared, his reign was but a sunbeam in the midst of the universal degeneracy; or if a ray of splendour was shed on the empire by his virtues or his victories, the transient glory was speedily dispelled by irruptions from without, or intrigue and revolt within. Gradually the work of decay proceeded, until the vast expanse of the imperial conquests was contracted to a few provinces, whose capital had been transferred to the shores of the Bosphorus. A languishing existence of about six centuries and a half—that is, from the revival of the western empire in 800 by Charlemagne, to the taking of Constantinople by the Turks in 1453—was brought to a close by the death of Constantine Palæologus, the last of a race who had continued, says Gibbon, 'to assume the titles of Cæsar and Augustus after their dominions were circumscribed to the limits of a single city, in which the language as well as manners of the ancient Romans had been long since forgotten!'

The family of Palæologus was of Greek origin, illustrious in birth and merit. 'As early,' says Gibbon, 'as the middle of the eleventh century, the noble race of the Palæologi stands high and conspicuous in Byzantine history. It was the valiant George Palæologus who

placed the father of the Comneni on the throne; and his kinsmen or descendants continued in each generation to lead the armies and councils of the state.' The first that wore the imperial purple was Michael, who was elevated to the throne in 1260. Already he had distinguished himself as a soldier and a statesman, and had been promoted in his early youth to the office of 'constable,' or commander of the French mercenaries. His ambition excited jealousy, and some acts of imprudence involved him in dangers from which he thrice escaped. One of those perils was the usual appeal which was made in the middle ages to the 'judgment of God' to vindicate injured innocence. To this ordeal Michael submitted, in presence of the emperor and the archbishop of Philadelphia. 'Three days before the trial, the patient's arm was enclosed in a bag, and secured by the royal signet; and it was incumbent on him to bear a red-hot bolt of iron three times from the altar to the rails of the sanctuary, without artifice and without injury. Palæologus eluded the dangerous experiment with sense and plesantry. "I am a soldier," said he, "and will boldly enter the list with my accusers; but a layman, a sinner like myself, is not endowed with the gift of miracles. Your piety, most holy prelate, may deserve the interposition of Heaven, and from your hands I will receive the fiery globe, the pledge of my innocence." The archbishop started, the emperor smiled, and the absolution or pardon of Michael was approved by rewards and new services.' The voice of the people and the favour of the army placed the crown on his head, in recompense for his military exploits and his public merits. With his accession terminated the reign of the last of the Latin emperors at Constantinople (Baldwin II.), and Michael became the founder of the Grecian dynasty.

The labours of the new monarch to retrieve the calamities of war, by encouraging industry, planting colonies, and extending trade, were deserving of all praise. His ambition raised up against him many enemies, spiritual and temporal; but if his policy was not always judicious, he increased his power and his fame by greatly enlarging his dominions. It was by his intrigues that the revolt of Sicily was instigated. A rude insult to a noble damsel by a Frank soldier, during a procession on the vigil of Easter (1282), spread the flame of insurrection over the whole island, and 8000 Franks were exterminated in a promiscuous massacre, which has obtained the name of the 'Sicilian Vespers.' His son and successor, Andronicus, was reckoned a learned and virtuous prince; but his long reign is chiefly memorable for the disputes of the Greek church, the invasion of the Catalans, and the rise of the Ottoman power. He associated with him in the administration his son Michael, at the age of eighteen; and upon the premature death of the latter, his son Andronicus, the emperor's favourite, became the colleague of his grandfather. The reign of the elder Andronicus was consumed in civil discord and disputes with his family, the young princes having raised the standard of revolt in order to get possession of the throne. He was at length compelled to abdicate; and assuming the monastic habit, he spent the last few years of his life in a cell, blind and wretched, his only consolation being the promise of a more splendid crown in heaven than he had enjoyed on earth.

After a series of inglorious struggles among the princes of the imperial house, the crown settled, in 1391, on Manuel, whose reign, however, was little else than a train of disasters. His capital was besieged by Amurath, and the Turks were masters of nearly the whole of his dominions, which had now shrunk into a small corner of Thrace, between the Propontis and the Black Sea, about fifty miles in length and thirty in breadth. To retrieve his fortunes, Manuel resolved on a journey to foreign countries, believing that the sight of a distressed monarch

would draw tears and supplies from the sternest barbarians. From Italy he proceeded to the coast of France, where he was received with the characteristic politeness of the nation. Two thousand of the richest citizens of Paris, armed and on horseback, came forth to meet him; and at the gates he was welcomed as a brother by Charles VI., who saluted him with a cordial embrace. He was clothed in a robe of white silk, and mounted on a milk-white steed—a circumstance of great importance in the French ceremonial, white being considered as the emblem of sovereignty. He was lodged in the Louvre, and a succession of feasts and balls, varied by the pleasures of the chase, was got up for his amusement. Having satisfied his curiosity, but without any prospect of assistance, he resolved to visit England. In his progress from Dover, he was entertained at Canterbury by the prior and monks of St Austin; and on Blackheath Henry IV. saluted the Greek hero, who for several days was honoured and treated in London as Emperor of the East. Having failed in the object of his journey, he returned to Constantinople (1402), and was allowed to finish his reign in prosperity and peace in 1425.

In his declining age, he had appointed as his associate his eldest son John, the second of the name. The corruptions of the church, divided between two popes, and the disputes of the clergy, afforded him ample scope for the exercise of his religious zeal, and it was to heal these ecclesiastical schisms that he undertook a voyage to Italy. But the downfall of his race and of the Grecian dynasty was approaching. At his decease (1448), there were five princes of the imperial house; but the death of Andronicus, and the monastic profession of Isidore, had reduced them to three—Constantine, Demetrius, and Thomas. Constantine ascended the vacant throne, the factious opposition of his brothers having been appeased by the interposition of the empress-mother, the senate, the soldiers, and the clergy, who allowed them the possession of the Morea.

The first act of the new emperor was to despatch an embassy to Georgia to bring home a princess whom he had chosen for his royal consort. His next care was to inquire into the state of public affairs, which had been completely neglected by the weakness or absence of his predecessor. But the imperial drama had reached its last act. The danger which had long brooded over the doomed house of the Palæologi was ready to burst in resistless fury upon the city of the Cæsars. Mohammed II. had vowed to become master of Constantinople, and vast were the preparations and the implements of war which he had provided for its capture or its destruction. The story of the siege need not here be told; nowhere has it been recorded with more picturesque and energetic brevity than in the glowing pages of Gibbon. Operations were carried on with unprecedented vigour and effect, rendered more terrible by the lavish use of gunpowder and artillery, then almost new elements in the art of war. Constantine did all that a Christian prince and a brave general could do. By his example he animated the courage of his soldiers, and revived the hearts of the citizens, sinking in despair. The scene on the day before the assault is thus described by an eye-witness:—"The emperor and some faithful companions entered the dome of St Sophia, which in a few hours was to be converted into a mosque, and devoutly received with tears and prayers the sacrament of the holy communion. He reposed some moments in the palace, which resounded with cries and lamentations; solicited the pardon of all he might have injured; and mounted on horseback to visit the guards and explore the motions of the enemy." But the dreaded 29th of May had come; the last hour of the city and the empire had struck. After a siege of fifty-three days, Constantinople, to use the words of Gibbon, 'which had defied the power of Chosroes, the chazan, and the caliphs, was irretrievably subdued by

the arms of Mohammed II. Her empire only had been subverted by the Latins; her religion was trampled in the dust by the Moslem conquerors.*

Constantine had nobly done his duty. Amidst the swarms of the enemy who had climbed the walls and were pursuing the flying Greeks through the streets, he was long seen with his bravest officers fighting round his person, and finally lost. His only fear was that of falling alive into the hands of the Infidels, and this fate he sought to avert by prudently casting away the purple. Amidst the tumult he was pierced by an unknown hand, and his body was buried under a mountain of the slain. The last words he was heard to utter was the mournful exclamation: 'Cannot there be found a Christian to cut off my head?' His death put an end to resistance and order, and left the capital to be sacked and pillaged by the victorious Turks. Truly has it been said, that the distress and fall of the last Constantine are more glorious than the long prosperity of the Byzantine Cæsars.

The difficulties and dying moments of the emperor have been faithfully and pathetically dramatised by Miss Joanna Baillie in her tragedy of *Constantine Paleologus*. She adheres closely to history, only she makes her hero receive his deathblow from the sword of a relenting Turk, who admires his bravery, and pronounces over him a farewell eulogy. All writers agree that the last of the imperial Paleologi was the best of his race; and had he not been so ill supported by his worthless subjects, and deserted by every Christian prince in Europe, he might have repelled the tide of Turkish invasion, though he would never have restored the glory of the empire. Yet gallantly did he front the storm, and perish as became the successor of a long line of kings—the last of the Romans.

The fall of Constantine was the signal for the degradation and dispersion of his whole race. His two surviving brothers, Demetrius and Thomas, reigned as despots of the Morea in Greece; but the ruin of the empire was the gloomy prelude to their own misfortunes. Demetrius became the pensioner of the new Turkish emperor Mohammed, and received a city of Thrace and some adjacent islands for his own maintenance and that of his followers. In this state of humiliating dependence he remained until death released him from his ignominious servitude. Thomas, the other brother, was driven into exile by the invasion of his dominions. He fled to Corfu, and from thence to Italy—according to Gibbon's account—with some naked adherents; his name, his sufferings, and the head of the apostle St Andrew, entitled him to the hospitality of the Vatican, and his misery was prolonged by a pension of 6000 ducats from the pope and cardinals.† He left two sons (he must have had a third, as will afterwards appear), Andrew and Manuel, who were educated in Italy. The eldest degraded himself by the looseness of his life and marriage, and died the inheritor of an empty title. Manuel was tempted to revisit his native country; and after spending the remainder of his life in safety and ease at Constantinople, he was gathered to his fathers, 'an honourable train of Christians and Moslems attending him to the grave.'

From this date—early in the sixteenth century—little is known of the name and lineage of the Paleologi. The crescent waved over the royal city of Constantine; and, as an old Byzantine annalist remarks, the last heir of the last spark of the Roman Empire seemed to be extinct. History had forgotten them, and the restless tide of human vicissitudes rolled onwards, unconscious of their existence. Italy was understood to be the asylum of the imperial outcasts; and there they might have vegetated in oblivion, or dropped into unhonoured graves without leaving a single representative, had not a monumental inscription revealed the fact, that a descendant of the Cæsars had found a retreat and a tomb in an obscure parish in England. In the

small church of Landulph, in Cornwall, the following inscription upon a small metal tablet, fixed in the wall, removes all doubt as to the identity and royal pedigree of the person whose memory it records. In its original spelling it runs thus:—'Here lyeth the body of Theodoro Paleologus of Pesaro in Italye, descended from ye Imperiall lyne of ye last Christian Emperors of Greece, being the sonne of Prosper, the sonne of Theodoro, the sonne of John, the sonne of Thomas, second brother to Constantine Paleologus, the eighth of that name, and last of ye lyne yt rayned in Constantinople vntill svedden by the Turkes; who married with Mary ye daughter of William Balls of Hadlye in Suffolke Gent., and had issu five children, Theodoro, John, Ferdinando, Maria, and Dorothy, and departed this life at Clyfton ye 21st of January 1636.* It appears, then, that Theodore, who married and died in Cornwall, was the fourth in direct descent from Thomas, younger brother of the Emperor Constantine, and who fled 'with some naked adherents to Italy,' where his children were educated.† The truth of the story related in the inscription was corroborated by a circumstance which happened upwards of twenty years ago. The vault in which Paleologus was interred having been accidentally opened, curiosity prompted the lifting of the lid. The coffin, which was made of oak, was in an entire state, and the body sufficiently perfect to shew that the dead man exceeded the common stature. The head was a long oval, and the nose believed to have been aquiline; a long white beard reached down the breast—another symbol of his Greek extraction.

Of his family little is known: Theodore, the eldest son, was a sailor, and died on board the *Charles II.*, as is proved by his will, dated 1698. He appears to have possessed landed property, and to have left a widow named Martha, but no issue. The younger daughter, Dorothy, was married at Landulph to William Arundell in 1636, and died in 1681.‡ Maria died unmarried, and was buried in the same church in 1674. Of John and Ferdinando, the other sons, no memorial seems to have been preserved in this country; and it was believed as highly probable that the church of Landulph contained the remains of the last survivors of the Grecian dynasty, once the illustrious sovereigns of Byzantium.

Time, however, the great revealer of secrets, brought to light facts which proved that one of the sons of Theodore of Pesaro in Italy had removed to the West Indies, where he lived for some years, and died in 1678. It is mentioned by the historian Oldmixon§ as a tradition, that a descendant of the former imperial Greek family of Constantinople resided in Barbadoes; but he doubts the fact, without giving any reason for his scepticism. The tradition, however, proves to have been quite current, and the circumstance that led to its confirmation, and to the discovery of the body of Ferdinando Paleologus, and other relics testifying to his connection with the Greek emperors, are narrated by Sir Robert Schomburgk in his recent history of Barbadoes. During the terrible hurricane of 1881, which nearly destroyed the island, among the other public buildings that yielded to the violence of the storm, was the parish church of St John, which stood in a romantic situation near the 'Cliff,' at an elevation of 824 feet. When the ruins were removed, and in clearing out the rubbish, 'the coffin of Ferdinando Paleologus (we quote Sir Robert's account) was discovered under the organ-loft,

* There is a slight error in the date of the inscription, as the entry of his burial is October 20th 1636.

† Only two sons of Thomas are mentioned by Gibbon—Andrew and Manuel; but the evidence of the Landulph tablet shews that he must have had a third, John.

‡ Her name is entered in the register as 'Dorothea Paleologus de Stirpe Imperatoribus.'

§ *British Empire in America*, vol. ii. p. 111.

in the vault of Sir Peter Callotin. The circumstance that the coffin stood in a direction opposite to the others deposited in the vault, drew attention to it; the head was lying to the west, the feet pointing to the east, according to the Greek custom. These accounts raised the curiosity of the rector of the parish; and in order to ascertain how much truth was connected with the tradition, he resolved to examine the supposed coffin of Palæologus; it was consequently opened on the 3d of May 1844, in presence of Mr R. Reid, jun.; Mr. J. G. Young; and Mr J. Hinkson. The coffin was of lead, and in it was found a skeleton of an extraordinary size, imbedded in quicklime, which is another proof of the Greek origin of Palæologus, as it is the custom in Greece to surround the body with quicklime. The coffin was carefully deposited in the vault now in possession of Josiah Heath, Esq., of Quinzer's and Redland.'

In the above discovery and examination, the coincidences are so numerous and so remarkable as to leave no doubt whatever that the Ferdinando Palæologus, whose body lies interred in St John's church, was the same individual mentioned in the Landulph inscription as a son of Theodore. The size of the skeleton, the envelope of quicklime, the position of the body, are corroborative of an Eastern descent. The name of the mother, Mary Balls, is an additional presumption, as among the earliest proprietors in the island several of that name occur; and three estates are given in Oldmixon's list as belonging to the family of the Balls. It has been assumed, therefore, with good reason, that a relationship may have existed between the mother of Ferdinando and the Balls in Barbadoes, which—at a period when so many families emigrated from England, chiefly from Kent and the southern and western counties—might have induced young Palæologus to seek his fortunes in the New World, after his father's death in 1636.

Of the residence of Ferdinando in the island for thirty years, ample evidence exists in various documents. Sir Robert Schomburgk was shewn by the rector of the parish, the Rev. J. H. Gittens, an old vestry-book of St John's, in which various entries occur of the name of Ferdinando Palæologus, from 1649 till 1669, as vestryman, churchwarden, trustee, surveyor of the highway, sidesman to the churchwarden, and lieutenant, &c. The last entry is that of his burial, 'October 3d 1678.' His name also appears in a legal document respecting the sale of some land, executed in 1658. But the most important evidence of his identity with the Cornwall family is his will, in which the names of his sisters, Maria and Dorothy, occur. It was entered in the Registrar's Office, the 20th of March 1678, and proved before the deputy-governor, Colonel Christopher Codrington. The widow became the sole survivor and heiress of the property, Theodorius having died in his youth, so that the last of the Palæologi reposes in the parish church of St John, in the island of Barbadoes; and the estate which once belonged to the descendant of the Greek emperors now forms part of Clifton Hall and the Plantation Ashford. Laying these circumstances together, and considering how completely the will of Ferdinando corroborates the Landulph inscription, of which he probably knew nothing, the genealogical problem, we think, is fairly wrought out, and the last of the descendants of the Roman Cæsars traced to his final resting-place beyond the Atlantic. A curious anecdote is mentioned by Sir Robert Schomburgk as to the revival of the tradition of one of the Palæologi being in Barbadoes. He says, but without vouching for its truth, that during the last conflict for Grecian independence and deliverance from the Turkish yoke, a letter was received from the provisional government at Athens, addressed to the authorities in Barbadoes, inquiring whether a male branch of the Palæologi was still existing in the island, and conveying the

request that if such were the case he should be provided with the means of returning to Greece, and the government would, if required, pay all the expenses of the voyage. This story was not current in Europe, at all events; and we on this side the water never dreamed that among the competitors of King Leopold for the throne was a veritable scion of the old imperial sovereigns of Constantinople.

The events detailed in the preceding narrative are fitted to suggest various interesting reflections and amusing speculations. The fate of the Palæologi—one day on a throne, the next in a dungeon, passing from regal state to wretched exile—may have been the bitter lot of other imperial families. If we find the descendants of the Greek emperors in the humble occupation of sailors and churchwardens, and vestrymen and road-trustees, there is nothing extravagant in the supposition, that we may have royal porters and scavengers on our streets, the sceptre having degenerated into the besom, and the truck taken the place of the chariot of state. The family of Nimrod may still exist, and retain their ancestral propensities in the craft of sportsmen and deer-stalkers, or in the lower grade of Jehus and jockeys. Who knows but the posterity of Solomon may be retailing old clothes, and the heirs of the Nebuchadnezzar dynasty still exist somewhere—perhaps among our graziers or cattle-dealers, our keepers of dairies or secretaries of agricultural associations. The line of Tamerlane may have ended in a grave-digger, and that of Frederick Barbarossa in a hair-dresser. The ideal transmigration of Pythagoras was not more improbable or more wonderful than the strange metamorphoses through which, in the course of centuries, the living representatives of kings and emperors are sometimes doomed to pass.

A CHAPTER ON CATS.

THE newspapers have recently been chronicling, as a fact provocative of especial wonder, the enterprise of some speculative merchant of New York, who has just been despatching a cargo of one hundred cats to the republic of New Granada, in which it would appear the race, owing, as we may believe, to the frequently disturbed state of the country, has become almost extinct.

Your cat is a domestic animal, and naturally conservative in its tastes—averse therefore to uproar, and to all those given to change. Its propensities are to meditation and contemplative tranquillity, for which reason it has ever been held in reverence by nations of a similar staid and composed disposition, and has been the favourite companion and constant friend of grave philosophers and thoughtful students. By the ancient Egyptians cats were held in the highest esteem; and we learn from Diodorus Siculus, their 'lives and safeties' were tendered more dearly than those of any other animal, whether biped or quadruped. 'He who has voluntarily killed a consecrated animal,' says this writer, 'is punished with death; but if any one has even involuntarily killed a cat or an ibis, it is impossible for him to escape death: the mob drags him to it, treating him with every cruelty, and sometimes without waiting for judgment to be passed. This treatment inspires such terror, that, if any person happen to find one of these animals dead, he goes to a distance from it, and by his cries and groans indicates that he has found the animal dead. This superstition is so deeply rooted in the minds of the Egyptians, and the respect they bear these animals is so profound, that at the time when their king, Ptolemy, was not yet declared the friend of the Roman people—when they were paying all possible court to travellers from Italy, and their fears made them avoid every ground of accusation and every pretext for making war upon them—yet a Roman having killed a cat, the people rushed to his

house, and neither the entreaties of the grantees, whom the king sent for the purpose, nor the terror of the Roman name, could protect this man from punishment, although the act was involuntary. I do not relate this anecdote,' adds the historian, 'on the authority of another, for I was an eye-witness of it during my stay in Egypt.*'

During their lives, the consecrated cats were fed upon fish, kept for the purpose in tanks; and 'when one of them happened to die,' says the voracious writer just cited, 'it was wrapped in linen, and after the bystanders had beaten themselves on the breast, it was carried to the Tarichea, where it was embalmed with cœdria and other substances which have the virtue of embalming bodies, after which it was interred in the sacred monument.' It has puzzled not a little the learned archaeologists, who have endeavoured to discover a profound philosophy figured and symbolised in the singular mythology of the Egyptians, to explain how it is that in Thebes, where the sacred character of the cat was held in the highest reverence, and cherished with the greatest devotion, not only embalmed cats have been found, but also the bodies of rats and mice, which had been subjected to the same anti-putrescent process. If, however, Herodotus is to be credited, the Egyptians owed a deep debt of gratitude to the mice; for the venerable historian assures us, and on the unquestionable authority of the Egyptian priests, that when Sennacherib and his army lay at Pelusium, a mighty corps of field-mice entered the camp by night, and eating up the quivers, bowstrings, and buckler-leathers of the Assyrian troops, in this summary fashion liberated Egypt from the terror of the threatened invasion. Probably the existence of mice-mummies may be accounted for in this way, and if—resorting to no violent supposition—we presume in the good work which the tiny patriots so sagaciously accomplished that their cousins-german the rats were assistant, the whole matter receives a satisfactory explanation. The hypothesis, it is submitted, is not without plausible recommendations on its behalf. There is extant a fragment of a comedy, entitled 'The Cities,' written by the Rhodian poet Anaxandrides, in which the Egyptian worship of animals is amusingly enough quizzed. A translation will be found in Dr Priehard's *Analysis of Egyptian Mythology*. The lines referring to cat-worship are as follow:—

'You cry and wail whene'er ye spy a cat,
Starving or sick; I count it not a sin
To hang it up, and flay it for its skin;'

from which it appears this gay free-thinker was not only somewhat sceptical in his religious notions, but, moreover, a hard-hearted, good-for-nothing fellow—one who, had he lived in our times, would unquestionably have brought himself within the sweep of the Society for the Prevention of Cruelty to Animals, and the Duke of Beaufort's Humanity Act.

We learn from Herodotus that in his days it was customary, whenever a cat died, for the whole household at once to go into mourning, and this although the lamented decease might have been the result of old age, or other causes purely natural. In the case of a cat's death, however, the eyebrows only were required to be shaved off; but when a dog, a beast of more distinguished reputation, departed this life, every inmate of the house was expected to shave his head and whole body all over. Both cats and dogs are watched and attended to with the greatest solicitude during illness.

* In the matter of fanaticism, the modern Egyptians, or rather the inhabitants of Alexandria, seem hardly to have degenerated from their ethnic 'forbearance,' as we read in Mr J. A. St John's travels the account of a serious insurrection which broke out some years ago in that city, in consequence of certain Jews having taken up the butcher's trade, and having slain the meat with a knife having three instead of five nails in the handle!

Indeed, by the ancient Egyptians the cat was treated much in the same way as are dogs amongst us: we find them even accompanying their masters on their aquatic shooting-excursions; and, if the testimony of ancient monuments is to be relied on, often catching the game for them, although it may be permitted to doubt whether they ever actually took to the water for this purpose.

In modern Egypt the cat, although more docile and companionable than its European sister, has much degenerated; but still, on account of its usefulness in destroying scorpions and other reptiles, it is treated with some consideration—suffered to eat out of the same dish with the children, to join with them in their sports, and to be their constant companion and daily friend. A modern Egyptian would esteem it a heinous sin indeed, to destroy, or even maltreat a cat; and we are told by Sir Gardner Wilkinson, that benevolent individuals have bequeathed funds by which a certain number of these animals are daily fed at Cairo at the Cadi's court, and the bazaar of Khan Khaleel.

But a tender regard for the inferior animals is a prevailing characteristic of the Oriental races, and is inculcated as a duty by their various religions. At Fez there was, and perhaps is at this day, a wealthily-endowed hospital, the greater part of the funds of which was devoted to the support and medical treatment of invalid cranes and storks, and procuring them a decent sepulture whenever they chanced to die. The founders are said to have entertained the poetical notion that these birds are, in truth, human beings, natives of distant islands, who at certain periods assume a foreign shape, and after they have satisfied their curiosity with visiting other lands, return to their own, and resume their original form.

To return, however, not to our sheep, but our cats, we must remark that, in modern times, in spite of the kindness the cat habitually receives in Egypt, his *morale* is not in that country rated very high—the universal impression being that, although, like Snug the joiner's lion, he is by nature 'a very gentle beast,' still he is by no means 'of a good conscience;' that he is, in short, a most ungrateful beast; and that when, in a future state, it is asked of him how he has been treated by man in this, he will obstinately deny all the benefits he has received at his hand, and give him such a character for cruelty and hardness of heart as is shocking to think of. The dog, however, it is understood, will conduct himself more discreetly, and readily acknowledge the good offices for which he is indebted to the family of mankind.

Singular anecdotes have been related of the intense repugnance persons have been found to entertain to these, at worst, harmless animals. One shall be given in the very words of the Rev. Nicholas Wanley, who, in his authentic *Wonders of the Little World*, has recorded a number of other facts quite as marvellous, and sustained by testimony not one whit more exceptionable:—'Mathiolus tells of a German, who coming in winter-time into an inn to sup with him and some other of his friends, the woman of the house being acquainted with his temper (lest he should depart at the sight of a young cat which she kept to breed up), had beforehand hid her killing in a chest in the same room where we sat at supper. But though he had neither seen nor heard it, yet after some time that he had sucked in the air infected by the cat's breath, that quality of his temperament that had antipathy to that creature being provoked, he sweat, and, of a sudden, paleness came over his face, and, to the wonder of us all that were present, he cried out that in some corner of the room there was a cat that lay hid.' Not long after the battle of Wagram and the second occupation of Vienna by the French, an aide-de-camp of Napoleon, who at the time occupied, together with his suite, the Palace of Schönbrunn, was proceeding to bed at an

unusually late hour, when, on passing the door of Napoleon's bedroom, he was surprised by a most singular noise, and repeated calls from the Emperor for assistance. Opening the door hastily, and rushing into the room, a singular spectacle presented itself—the great soldier of the age, half undressed, his countenance agitated, the beaded drops of perspiration standing on his brow, in his hand his victorious sword, with which he was making frequent and convulsive lunges at some invisible enemy through the tapestry that lined the walls. It was a cat that had secreted herself in this place; and Napoleon held cats not so much in abhorrence as in terror. 'A feather,' says the poet, 'daunts the brave;' and a greater poet, through the mouth of his Shylock, remarks that 'there are some that are mad if they behold a cat—a harmless, necessary cat.' Count Bertram would seem to have shared in this unaccountable aversion. When 'Monsieur Parolles, the gallant militarist, that had the whole theory of war in the knot of his scarf, and the practice in the chape of his dagger,' was convicted of mendacity and cowardice, Bertram exclaimed, 'I could endure anything before this but a cat, and now he's a cat to me.' The force of censure could no further go.

If Napoleon, however, held cats, as has been averred, in positive fear, there have been others, and some of them illustrious captains, that have regarded them with other feelings. Marshal Turenne could amuse himself for hours in playing with his kittens; and the great general, Lord Heathfield, would often appear on the walls of Gibraltar, at the time of the famous siege, attended by his favourite cats. Cardinal Richelieu was also fond of cats; and when we have enumerated the names of Cowper and Dr Johnson, of Thomas Gray and Isaac Newton, and, above all, of the tender-hearted and meditative Montaigne, the list is far from complete of those who have bestowed on the feline race some portion of their affections.

Butler, in his *Hudibras*, observes, in an oft-quoted passage, that

'Montaigne, playing with his cat,
Complains she thought him but an ass.'

And the annotator on this passage, in explanation, adds, that 'Montaigne in his *Essays* supposes his cat thought him a fool for losing his time in playing with her;' but, under favour, this is a misinterpretation of the essayist's sentiment, and something like a libel on the capacity of both himself and cat. Montaigne's words are: 'When I play with my cat, who knows whether I do not make her more sport than she makes me? We mutually divert each other with our play. If I have my hour to begin or refuse, so also has she hers.' Nobody who has read the striking essay in which these words appear could for a moment misconceive their author's meaning. He is vindicating natural theology from the objections of some of its opponents, and in the course of his argument he takes occasion to dwell on the wonderful instincts, and almost rational sagacity of the inferior animals. We must, however, lament that, although he does full justice to the 'half-reasoning elephant,' to the aptitude and fidelity of the dog, to the marvellous economical arrangements of the bee, and even to the imitative capacity of the magpie, he pays no higher tribute to the merits of the cat than that she is as capable of being amused as himself, and like himself, too, has her periods of gravity when recreative sports are distasteful. Her social qualities he does not allude to, though he, so eminently social himself, could scarcely have failed to appreciate them.

In this country, at this time, cats have superseded parlour favourites decidedly less agreeable in their appearance, and infinitely more mischievous in their habits. Writing in the seventeenth century, Burton, in his *Anatomy of Melancholy*, remarks that 'Turkey gentlemen, that are perpetual prisoners, still mewed

up according to the custom of the place, have little else, beside their household business or to play with their children, to drive away time but to dally with their cats, which they have in *delittiis*, as many of our ladies and gentlewomen use monkeys and little dogs.' It is not the least merit of the cat that it has banished from our sitting-rooms those frightful mimicries of humanity—the monkey tribe; and as to the little dogs Tray, Blanch, and Sweetheart, although we are not insensible to their many virtues and utilities, we care not to see them sleeping on our hearth-rug, or reposing beside our work-tables.

BEGGARS IN THE FAR EAST.

BENGAL is blessed with a mild climate and a fertile soil. Provisions are consequently cheap; and as neither substantial houses nor expensive clothing is there essential to comfort, we might naturally expect to see less of misery and destitution than in this country. Such, however, is not the case. Our severe winter engenders habits of industry and forethought, which are unknown in India. The ease with which in most cases their few wants are supplied, renders the inhabitants of that country in the highest degree improvident; and nowhere do we see a greater number of beggars, and misery and destitution paraded through the streets in more revolting forms.

There are no poor-laws in any part of India. Relief, however, is not withheld, nor indeed sparingly bestowed. Many can afford to give a little; and where nothing is exacted, many give willingly. Little charity is bestowed by Europeans in the streets, as they generally ride in palanquins or carriages, and as, besides, they feel the weight even of a purse too much on a hot day. However, let it not be supposed that they, like Dives, wallow in wealth, and close their ears to the importunities of the heathen. The Baboo or Sircar gives weekly or monthly pensions to some patronised beggars; and on a Saturday in some large towns, the blind, lame, and halt come to the gates of the grandees, and receive from the trusty *durwan* or doorkeeper a handful of cowries and coarse rice, of which one, two, or three rupees' worth are mixed up, according to the circumstances of the master. But it is not to ordinary beggars I now propose to draw the attention of the reader—the infirm or the lazy, with whom we are all tolerably familiar. But in India there is another class of beggars—*religious* and *professional* beggars—who are proud of their calling. I do not mean that there are no religious mendicants to be found at home; but although the object to be attained in both countries may be similar, the agents employed in the East are so different, that a description of them will to many European readers have all the gloss of novelty.

The two principal sects in Bengal are known as *Soneasseees* and *Byrdgees*. The former *exclusively* worship Mahado. 'They are not to inhabit houses or temples,' say their scriptures; 'but to live in woods and forests, under the wide expanse of heaven, there to meditate upon the greatness of the Creator, and contemplate his beautiful works.' An infant who is to become a *Soneassee* has from his birth the badge of Sheva upon him: no razor ever touches his hair, and his locks are matted and dishevelled, when other children's are neatly combed and anointed. When he approaches manhood, he takes the vow of celibacy, he receives from the hand of the Brahmin the *muntra* or mystical creed, the dried skin of an antelope, and a

piece of coarse, unbleached cotton, stained yellow with ochre, which he can use as a plaid, it being seven feet long; upon the skin he is supposed to sit and sleep, and the cloth overshadows the shoulders of the young enthusiast. Even after these are worn out, as it is supposed that the devotee is pretty well broken in to the hardships of his situation, they on no account may be renewed. These Sonecassees seldom adhere to the letter of their religion in the present day, although it is said that in times gone by some of their class have sat absorbed and abstracted until their spirit held communion with the great god—their bodies wasting away from neglect, and their nails growing like claws. In the present day, prayer and meditation are given to the winds, and they may be seen fat and sleek, perambulating the streets of the towns and villages, smeared over with ashes and ochre, and great coils of matted hair, which some tastefully wind like a turban round their head. They take care also to display, in glaring red and white paint, upon their foreheads and arms, the various insignia or marks of Sheva, such as the trident. Occasionally one also flourishes about a steel trident, which the figure of Mahado always wields in his hand, and which is also placed on the summit of his temple. The Sonecassees are the most impudent and importunate of beggars. There came under my notice a band of three, who used regularly to visit the town twice a week. These men had made a vow to collect a certain number of rupees to build a temple, and for this purpose infested the doors of the wealthiest of the Hindoo community, and followed and persecuted them even in their drives with continued cries. It is astonishing how soon superstition enabled them to fulfil their vow, and how the extortioners were allowed to escape the punishment their impudence deserved.

The Byrāgees are not so intrusive a sect. They frequently live in the open air, though not prohibited from seeking other shelter. Their heads are differently treated from those of the Sonecassees, for both men and women have the crown shaved quite smooth. Both sexes wear a piece of cloth checked like shepherd's plaid. They have great strings of wooden beads, or *malās*, turned out of the stalks of the holy toolis, round their necks; and they generally collect their rice and cowries in a dried gourd-shell. Persons of this sect at their death are placed in an upright position in a deep grave, and so consumed with fire. In former times, the widows used to burn themselves with their lords. The Byrāgees, when they attain years of discretion, may choose their wives from any caste they please. Some of the Byragins, therefore, are said to be far cleverer than the everyday Hindoo women, having been selected from a class which are looked down upon by the others, but who are taught high accomplishments, and are devoted to the temples of the gods. In his begging excursions the Byrāgee carries a pair of cymbals or a small gong; and singing the songs of Krishna, and his courtships among the milkmaids, he delights the hearts of his Hindoo hearers, and makes them lavish of their gifts.

The English reader perhaps has never heard of a beggar such as I shall now depict. One may happen to be in a reflective mood, and aroused from his meditations by what he supposes to be a cow lowing close to his ear. He starts up and goes to the window, but instead of that quadruped he finds a man standing with a rope round his neck, and a woful countenance, holding out his palms, indicating that he wants charity. This man has had the misfortune to lose his cow; and as it died tethered, his religion imposes on him the penalty of begging from door to door without speaking, but imitating the cow, till he has realised enough to purchase one of these sacred animals, and to give something besides in charity to the Brahmins. This provision was perhaps made by the religion of the country

in favour of the cow, to preserve so useful an animal from ill-treatment; and it is astonishing to see how implicitly the Hindoo submits himself to a mere convention, which he might easily evade.

A LATE PRISON REPORT.

IN the Sixteenth Report on the state of the Prisons, by Mr Frederic Hill, lately laid before parliament, will be found some passages worthy of general attention. While speaking favourably of the system of discipline now ordinarily pursued towards prisoners, Mr Hill is obliged to admit that certain prisons are rendered much too attractive; in fact, that they create crime. It is important that this condition of affairs should be known. Good food and medical attendance are, it seems, the attractions. The following are Mr Hill's words, with the quotations he makes from the statements of prison officials:—

'Several of the prisons continue to be attractive, to certain classes of persons, instead of repulsive; owing, apparently in some instances, to the better dietary of the prison as compared with that of the workhouse; in others, to the good medical treatment generally provided in prisons; and in others, to a practice of giving prisoners clothing on their liberation, a practice which, did the law permit, might be replaced by a rule enabling prisoners to earn clothing by extra labour.'

'The governor of the borough prison at Cambridge stated that many persons were reckless about committing offences, because they preferred being sent to the prison to going to the workhouse, owing chiefly (according to their statements) to their getting better food at the prison.'

'The chaplain of the prison at Spilsby stated as follows:—"I am sorry to observe that the present system of discipline here does not deter people from the commission of crime. Several have said that they would rather come here than go to the Union workhouse."....

'Mr Dunn, one of the surgeons of the prison at Wakefield, states—"I am convinced that many persons, especially females, get committed to the prison on purpose to be cured of attacks of disease. Many of them have admitted to me that it was so. A man from Bradford, who went out last week, told me that he had been here before, and that he had got committed again in consequence of his having a return of his disease, and that he came to be cured.... One man who was here for a month last autumn, and who came in a very diseased state, but who left cured, required, during nearly the whole time, a pint of wine per day, besides malt liquor. It was a case in which a very liberal diet is necessary to preserve life; and it was requisite to have a prisoner, acting as nurse, to sit up with him through the night. The cost to the West Riding of this single case, counting expenses of all kinds, could not have been less than L.6."

'The governor of the city prison at York said—"By the acknowledgments of the prisoners themselves, I know that the practice still continues of committing offences on purpose to get committed to this prison. Four prisoners were liberated this morning who had broken a street-lamp with the evident intention of being sent to this prison. They were sentenced to seven days' imprisonment, and on their liberation each prisoner was supplied with a coat, waistcoat, pair of trousers, and a pair of shoes, and one of them had a shirt also! Many times last winter gas-lamps and the windows of the police-office and vagrant-office were broken, in order to get admission to the prison. Out of eighteen male prisoners who were brought to trial at the last Quarter-Sessions, twelve in my opinion committed their offences for the direct purpose of being sent to prison. Most of the vagrants committed to the prison still pass their time in idleness; no prisoners

except those sentenced to hard labour being set to work."

"The following is an extract from the visiting justices' minute-book at the same prison:—

"Dec. 12th, 1849.—The number of prisoners who commit offences with the object of being maintained during the winter increases yearly, and is deserving of serious consideration, as a serious expense is entailed thereby on the city. The imprisonment inflicted is not looked on as a punishment, but a reward."

If such really be the case, it is evident that a wrong course has been pursued in making the prisons so comfortable. Some years ago, when society was seized with a paroxysm of humanity, prisons were got up in a style of palatial splendour, and criminals, the most worthless of the population, were treated with a degree of tenderness which was opposed to every principle of justice. Possibly the method of reclaiming by kindness was not bad in the abstract, and in numerous instances it was perhaps effective; but in the main it was unsuitable to a complicated condition of ignorance, poverty, vice, and wretchedness. It should have been borne in mind that there is a distinct class of persons to whom any kind of provision is desirable, and who, being sunk below all sentiments of self-respect, shame, and regret, would very willingly sell themselves into slavery for the sake of a momentary gratification. To think of a warm, comfortable prison being an object of dread to this utterly-abandoned class!

Another philosophical crotchet did no small mischief. It was alleged that hard labour on the tread-mill would do harm: knowing that the labour tended to no useful purpose but merely the turning of a wheel, prisoners would feel degraded, and this feeling would prevent their reclamation! The error here consisted in imagining that the criminal class possessed the feelings of gentlemen; whereas the real thing to be thought of, was to give them labour so excessively toilsome and irksome as to be remembered with salutary horror all the days of their life. For example, no kind of punishment, we believe, has proved so sure a terror as that of the shot-drill in the military prisons. This consists in lifting a cannon-ball of perhaps twenty pounds' weight; marching with it for a dozen yards; then laying it down; and so on, repeating the same thing for an hour. Now this is clearly a useless and most degrading species of labour; yet it is a terrible infliction, and we are told seldom fails in its effect—that is to say, it deters from the commission of crime.

The experience of the last few years would shew that much is still to be learned in the art of criminal discipline; and indeed the whole question of what is to be done with our criminal population is becoming daily more perplexing. Mere confinement is found to be of small avail. Transportation is exploded; for it improves the circumstances of criminals instead of making them worse. Capital punishment has also had its day, and, excepting for a very few offences, is abandoned as useless, independently of being revolting to humanity. One writer proposes to work convicts in gangs at out-door labour, such as mining, and making railways; but the public would never tolerate the spectacle of this worst species of slave-labour; and besides, the employment of honest workers would be ruined. We are inclined to think that imprisonment, in a severe form, is after all the only practicable means of dealing with criminals. If anything be urgently wanted, it is a plan for preventing the growth of the criminal class; and this probably is not so difficult as it may appear. Of course, till there be a far broader system of public education than now prevails, the criminal population will never want recruits. Nevertheless, even with our present imperfect educational arrangements, something might be done. The criminal class is discovered to be on the whole a nervous class. The practice of living by depredation

runs in families, and clings to individuals. The police of any given town could put their hand on almost every person who lives by fraud, theft, and robbery. They could at a day's notice secure nearly every one of them. A knowledge of this fact has suggested to Mr Matthew Hill a plan for capturing the whole criminal class, and obliging them to give security for their good behaviour; failing which, they should suffer incarceration as notoriously dangerous and troublesome to society. A fear of trenching on the liberty of the subject may prevent this ingenious scheme of the Recorder of Birmingham from being carried into effect; but to something or other of the kind he proposes, society must come at last, if it wish to save itself from being everlastingly worried and plundered by a habitually predatory class. In the Prison Report to which we have above referred, mention is made of a single family of thieves, consisting of fifteen individuals, who cost the country L26,000 before they were got rid of. Is not such a fact quite monstrous!

FRENCH BATTLE-PICTURES.

In an American work—*Glances at Europe*, by Mr H. Greeley—the following sound observations occur on the battle-pictures in the palace of Versailles: "These battle-pieces have scarcely more historic than artistic value, since the names of at least half of them might be transposed, and the change be undetected by ninety-nine out of every hundred who see them. If all the French battles were thus displayed, it might be urged with plausibility that these galleries were historical in their character; but a full half of the story—that which tells of French disaster and discomfiture—is utterly suppressed. The battles of Ptolemais, of Ivry, of Fontenoy, of Rivoli, of Austerlitz, &c. are here as imposing as paint can make them; but never a whisper of Agincourt, Cressy, Poitiers, Blenheim, or Ramillies; nor yet of Salamanca, of Vittoria, of Leipsic, or Waterloo. Even the wretched succession of forays which the French have for the last twenty years been prosecuting in Algerine Africa, here shine resplendent; for Vernet has painted, by Louis-Philippe's order, and at France's cost, a succession of battle-pieces, wherein French numbers and science are seen prevailing over Arab barbarism and irregular valour, in combats whereof the very names have been wisely forgotten by mankind, though they occurred but yesterday. One of these is much the largest painting I ever saw, and is probably the largest in the world, and it seems to have been got up merely to exhibit one of Louis-Philippe's sons in the thickest of the fray. Last of all, we have the Capture of Abd-el-Kader, as imposing as Vernet could make it, but no whisper of the persistent perfidy wherewith he has been retained for several years in bondage, in violation of the express agreement of his captors. The whole collection is, in its general effect, delusive and mischievous—the purpose being to exhibit war as always glorious, and France as uniformly triumphant. It is by means like these that the business of shattering knee-joints and multiplying orphans is kept in countenance."

NEW APPLICATIONS OF MANGEL-WURZEL.

A patent has been taken out for the following applications of mangel-wurzel:—1st, To prepare a substance which may be combined with, or employed in place of coffee, the mangel-wurzel roots are well washed, cut into pieces about the size of peas or beans, and then dried and roasted in the same manner as coffee-berries. The product is ground after being roasted, and it is then ready for use. 2d, A substitute for tea is produced by cutting the leaves of mangel-wurzel into small strips or shreds, drying the same, and then placing them upon a hot plate, which is kept at a temperature sufficiently high to slightly char the leaves. The charred mangel-wurzel leaves are to be used in precisely the same way as tea. 3d, To manufacture a fermented liquor, the mangel-wurzel roots are well washed, cut into small pieces, and put into a vat, wherein they are permitted to ferment for

two or three days, at a temperature of about 70 degrees, and water is added thereto. A fermented liquor is thus obtained similar to perry or cider. 4th, When the mangel-wursel roots are to be employed in the preparation of wort, they are washed, and cut into small pieces, which are dried, or slightly charred, by the action of kilns or ovens, of the kind used for drying malt; and wort is prepared from this produce in the same manner as from malt.

THE MARTYRDOM OF FAITHFUL IN VANITY FAIR.*

I.

The great human whirlpool!—'tis seething and seething :
On ! No time for shrieking out, no time for breathing ;
All toiling and moiling—some feebler, some bolder,
But each sees a fiend-face grin over his shoulder :
Thus merrily live they in Vanity Fair !

The great human caldron—it boils ever higher ;
Some drowning, some sinking ; while some, creeping
nigher,
Come thirsting to lean o'er its outermost verges,
Or touch—as a child's feet touch trembling the surges :
One plunge—Ho ! more souls swamped in Vanity
Fair !

' Let's live while we live, for to-morrow all's over.
Drink deep, drunkard bold ! and kiss close, thou mad
lover !
Smile, hypocrite, smile ! it is no such hard labour,
While each with red hand tears the heart of his neighbour
All slyly.—We're strange folk in Vanity Fair !

' Hiss !—each for himself, or herself, which sounds
smoother,
Though man's no upholder, and woman no soother,
Both struggle alike here.—What, weeping !—what, raving !
Pah !—fight out the battle all ! No time for saving !
Ha ! ha ! 'tis a wondrous place, Vanity Fair !'

The mad crowd divides, and then closes swift after ;
Afar, towers the pyre, lit with shouting and laughter ;
' What new sport is this !' lisps a reveller, half turning ;—
' One Faithful, poor wretch ! who is led to the burning :
He cumbered us sorely in Vanity Fair !

' A dreamer—who held every man for a brother ;
A coward—who, smit on one cheek, gave the other :
A fool—whose blind truth she believed all knaves' lying ;
Too simple to live, so most fitted for dying.
Ha ! such are best swept out of Vanity Fair.'

II.

Silence ! though the flame-drifts wave and flutter ;
Silence ! though the crowd their curses mutter ;
Silence ! through this fiery purgatory
God is leading up a soul to glory.

See, the white lips with no moans are trembling,
Hate of foes, or plaint of friends' dissembling ;
If sighs come—most patient prayers outlive them :
' Lord, these know not what they do. Forgive them !'

Thirstier still the roaring flames are glowing,
Fainter in his ear the laughers growing ;
Brief endures the fierce and fiery trial—
Angel-welcomes down the earth-denial.

Now the amorous death-fires, gleaming ruddy,
Clasp him close. Down sinks the quivering body,
While through harmless flames immortal flying
Shoots the beautiful soul. This—this is dying !

* Suggested partly by a sketch in David Scott's illustrations of the *Pilgrim's Progress*.

Lo ! the opening heavens with splendours rifted ;
Lo ! the palms that wait those hands uplifted ;
And the fiery chariot cloud-descending,
And the legions angels close attending !

Let his poor dust mingle with the embers,
While the crowd sweeps on, and none remembers ;
Saints and angels through the Infinite glory,
Praising God, recount the martyr's story.

Thou, who through the trial-fires bewildering
Of this cruel world, dost lead Thy children,
With the purifying give the balm ;
Grant to martyr-pangs the martyr's palm !

VARIETY OF AMBER.

There is a variety of amber, of the opacity of white wax, with a very slight yellowish tinge. It is found intermixed with yellow amber, in thin bands of some breadth. When the magnificent pile of buildings called Fonthill Abbey was exhibited to the public, before the sale of its curious and costly furniture, it contained an amber cabinet, as beautiful in workmanship as material. It was quadrangular, and about fifteen inches by twelve at the base, standing on four legs, that raised it about half an inch from its pedestal. It was pyramidal in form, about fourteen inches high, and divided into eleven stages. These were separated by a ledge of yellow amber, about one-eighth of an inch in thickness, projecting a little over the under stage, like a cornice. The front of each stage was ornamented with recumbent figures in white amber, in relief. Some parts were at least one-eighth of an inch in thickness. The effect was much like that of the white figures on the purple ground of the well-known Portland Vase. Each stage had the appearance of opening as a drawer. The top was flat, and the whole of the yellow amber beautifully transparent.

HAVE SERPENTS TASTE ?

Some naturalists have surmised that serpents have no sense of taste, because the boa-constrictor in the Zoological Gardens swallowed his blanket. Chemistry may, however, assist us in solving the mystery, and induce us to draw quite an opposite conclusion from the curious circumstance alluded to. May not the mistake of the serpent be attributed to the marvellous acuteness of his taste ? Take this reason : All vegetable substances contain starch, all animal substances contain ammonia ; now it is most probable that the snake detected the animal quality—the ammonia—in the wool of the blanket, and he therefore naturally enough inferred that his bed was something suitable to his digestive organs. It is certain that he committed an error of judgment, but that error may be traceable to the subtilty of his taste rather than to its obtuseness. We throw out this suggestion as a specimen, if nothing better, of what contradictory inferences may be drawn from a single fact, and as a hint of how much caution is necessary in arriving at absolute opinions, even when the evidence is apparently most unmistakable.

AN AMERICAN EDITOR.

He is a dangerous man to be trifled with. The grand hickory-stick he twirls in his hand would be enough, with his dare-devil look, to frighten most persons ; but when we state that in the depth of the pocket of the remarkable check-coat that he wears he conceals one of the most beautiful 'persuaders' ever manufactured by Colt, we are satisfied he will be a terror to all evil-doers. We should also state that generally he is occupied doing out-door business, but that on every Saturday until one o'clock P.M. he is always at the office, perfectly ready and willing to give any and every satisfaction for the articles he publishes.—*Boston Rouge Gazette*.

Printed and Published by W. and R. CHAMBERS, High Street, Edinburgh. Also sold by W. S. ORR, Amen Corner, London ; D. N. CHAMBERS, 55 West Nile Street, Glasgow ; and J. M'GLASHAN, 50 Upper Sackville Street, Dublin.—Advertisements for Monthly Parts are requested to be sent to MAXWELL & Co., 81 Nicholas Lane, Lombard Street, London, to whom all applications respecting their insertion must be made.

No. 420. NEW SERIES.

SATURDAY, JANUARY 17, 1852.

PRICE 1½d.

HOW IS THE WORLD USING YOU?

THIS is a very common question, usually put and answered with more or less levity. We seldom hear of any one answering very favourably as to the usage he experiences from the world. More generally, the questioned seems to feel that his treatment is not, and never has been, quite what it ought to be. It has sometimes occurred to me, that a great oversight is committed in our so seldom putting to ourselves the co-relative question: What have I done to make the world use me well? What merit have I shewn—by what good intention towards the world have I been animated—what has been the positive amount of those services of mine on which I found my pretensions to the world's rewards? All of these are interrogations which it would be necessary to answer satisfactorily before we could be truly entitled to take measure of the world's goodness to us in return; for surely it is not to be expected that the world is to pay in mere expectancy: time enough, in all conscience, when the service has been rendered, or at soonest, when a reasonable ground of hope has been established that it will not be withheld or performed slightly. Only too much room there is to fear that, if these questions were put and faithfully answered, the ordinary result would be a conviction that the world had used us quite as well as we deserved.

Men are of course prevented from going through this process by their self-love. Unwillingness to see or own their shortcomings, keeps them in a sort of delusion on the subject. Well, I do not hope to make an extensive change upon them in this respect; but perhaps it may not be impossible to rouse one here and there to the correct view, and thus accomplish a little good.

Let us address ourselves to commercial life first, for the labour by which man lives is at the bottom of everything. Here we meet the now well-recognised principle in political economy, that generally wages, salaries, remunerations of all kinds, are in pretty exact relation to the value of the services performed—this value being of course determined, in a great degree, by the easiness or difficulty of the work, the commonness or rarity of the faculties and skill required for it, the risk of non-success in the profession, and so forth. Many a good fellow who feels that his income is inconveniently small, and wonders why it is not greater, might have the mystery solved if he would take a clear, unprejudiced view of the capacity in which he is acting towards the public. Is he a slave of the desk, in some office of routine business? Then let him consider how many hundreds of similar men would answer an advertisement of his seat being vacant. The fatal thing in

his case evidently is, that the faculties and skill required in his situation are possessed by so many of his fellow-creatures. Is he a shopkeeper in some common line of business?—say a draper. Then let him consider how easy it is to be a draper, and how simple are the details of such a trade. While there are so many other drapers in the same street, his going out of business would never be felt as an inconvenience. He is perhaps not doing any real good to the public at all, but only interloping with the already too small business of those who were in 'the line' before him. Let him think of the many hours he spends in idleness, or making mere appearances of business, and ask if he is really doing any effective service to his fellow-creatures by keeping a shop at all. It may be a hardship to him to have failed in a good intention; but this cannot be helped. He may succeed better in some other scheme. Let him quit this, and try another, or set up in a place where there is what is called 'an opening'—that is, where his services are required—the point essential to his getting any reward for his work. We sometimes see most wonderful efforts made by individuals in an overdone trade; for example, those of a hatter, who feels that he must give mankind a special direction to his shop, or die. Half-a-dozen tortoise-like missionaries do nothing but walk about the streets from morning to night, proclaiming from carapace and plastron,* that there are no hats equal to those at No. 98 of such a street. A van like the temple of Juggernaut parades about all day, propagating the same faith. 'If you want a good hat,' exclaims a pathetic poster, 'try No. 98.' As you walk along the street, a tiny bill is insinuated into your hand, for no other purpose, as you learn on perusing it, but to impress upon you the great truth, that there are no hats in the world either so good or so cheap as those at No. 98. The same dogma meets you in omnibuses, at railway platforms, and every other place where it can be expected that mankind will pause for a moment, and so have time to take in an idea. But it is all in vain if there be a sufficient supply of good and cheap hats already in that portion of the earth's surface. The superfluous hatter must submit to the all-prevailing law, that for labours not required, and an expenditure of capital useless as regards the public, there can be no reward, no return.

Sometimes great inconveniences are experienced in consequence of local changes; such as those effected by railways, and the displacement of hand-labour by machinery. A country inn that has supplied post-

* The upper and under plates of the tortoise are so called by naturalists.

horses since the days of the civil war, is all at once, in consequence of the opening of some branch-line, deserted by its business. It is a pitiable case; but the poor landlord must not attempt to be an innkeeper without business, for then he would be a misapplied human being, and would starve. Now the world uses him a little hardly in the diversion of his customers; that may be allowed: we must all lay our account with such hardships so long as each person is left to see mainly after himself. But if he were to persist in keeping his house open, and thus reduce himself to uselessness, he would not be entitled to think himself ill-used by reason of his making no profits, seeing that he did nothing for the public to entitle him to a remuneration. The poor handloom weavers—I grieve to think of the hardships they suffer. Well do I remember when, in 1813 or 1814, a good workman in this craft could realise 36s. a week. There were even traditions then of men who had occasionally eaten pound-notes upon bread and butter, or allowed their wives to spend L.8 upon a fine china tea-service. There being a copious production of cotton-thread by machinery, but no machinery to make it into cloth, was the cause of the high wages then given to weavers. Afterwards came the powerloom; and weavers can now only make perhaps 4s. 6d. per week, even while working for longer hours than is good for their health. The result is most lamentable; but it cannot be otherwise, for the public will only reward services in the ratio of the value of these services to itself. It will not encourage a human being, with his glorious apparatus of intelligence and reflection, to mis-expend himself upon work which can be executed equally well by unthinking machinery. Were the poor weavers able so far to shake themselves free from what is perhaps a very natural prejudice, as to ask what do we do to entitle us to any better usage from the public, they would see that the fault lies in their continuing to be weavers at all. They are precisely as the innkeeper would be, if he kept his house open after the railway had taken all his customers another way.

There are many cases in the professional walks of life fully as deplorable as that of the weavers. Few things in the world are more painful to contemplate than a well-educated and able man vainly struggling to get bread as a physician, an artist, or an author. It is of course right that such a man should not be too ready to abandon the struggle as hopeless; for a little perseverance and well-directed energy may bring him into a good position. But if a fair experiment has been made, and it clearly appears that his services are not wanted, the professional aspirant ought undoubtedly to pause, and take a full unprejudiced view of his relation to the world. 'Am I,' he may say, 'to expect reward if I persist in offering the world what it does not want? Are my fellow-creatures wrong in withholding a subsistence from me, while I am rather consulting my own tastes and inclinations than their necessities?' It may then occur to him that the great law must somehow be obeyed—a something must be done for mankind which they require, and it must be done where and how they require it, in order that each individual may have a true claim upon the rest. To get into the right and fitting place in the social machine may be difficult; but there is no alternative. Let him above everything dismiss from his mind the notion, that others can seriously help him. Let him be self-helpful,

think and do for himself, and he will have the better chance of success.

We now come to a second branch of the subject—namely, as regards our conduct and manners in the scenes of social life. One might suppose it to be a very clear thing, that a person possessing no pleasing accomplishment could never be so agreeable a member of society as one who possessed one or more of such qualifications. It might seem very evident, that a person who had never taken any trouble to acquire such accomplishments, did not deserve so much of society as one who had taken such trouble. Yet such is the blinding influence of self-love, that we continually find the dull and unaccomplished speaking and acting as if they considered themselves entitled to equal regard with others who, on the contrary, can contribute greatly to the enjoyments of their fellow-creatures. This is surely most unreasonable—it is, as in the case of the unnecessary shopkeeper or weaver, to desire the reward and yet not perform the service. Were such persons to clear themselves of prejudice, and take an unflattering view of their relation to society, they would see that the reward can only be properly expected where it has been worked for. They might in some instances be prompted to make efforts to attain some of those accomplishments which contribute to make the social hour pass agreeably, and thus attain to a true desert, besides 'advancing themselves in the scale of thinking beings.' If not, they might at least learn to submit unrepiningly to that comparatively moderate degree of notice and regard which is the due of those who are perfectly ordinary in their minds, and fit only to take a place amongst the audience.

Society, as is well known, has its favourites, and also its unpopular characters. If we dissect the character of the favourite, we shall invariably find a great substratum of the amiable. He will probably have accomplishments also, and thus be able to add to the happiness of his fellows. It is not improbable that in many cases a good share of love of approbation will be detected; but this is of no consequence in the matter. The general fact we assume to be, that the genuinely amiable is there in some force. It will, I believe, be likewise found that the unpopular character has something too much of the centripetal system about him—that is to say, desires things to centre in himself as much as possible—and neither has any great natural impulse to the amiable, nor will take the trouble to assume the complaisant. Now, it is not uncommon to observe traces of dissatisfaction in the unpopular characters, as if they felt themselves to be treated unjustly by the world. But can these persons reasonably expect to be received with the same favour as men who are at once gentle and inoffensive in their ordinary demeanour, and actively good among their fellow-creatures? Certainly not. Let us see here, too, the complaining party take an unprejudiced view of his relation to society. Let him understand that he only will be loved if he is lovable, and we may hope to see him taking some pains to correct his selfishness, and both seem and be a kind and genial man. Most assuredly, in no other way will his reputation and his treatment by the world be reversed.

In fine, we would have all who are inclined to doubt whether the world uses them well or not, to ask of themselves, in the first place, how they use the world.

If they find that they do little for it—are stupid, illiterate, possessed of not one graceful accomplishment, neither useful nor ornamental, but selfish, sulky, and unamiable, then let them try whether a remedy cannot be found in themselves. It is not to be expected of all that they are to be greatly serviceable in any way to the world, or very agreeable either; but it is the duty of all who desire the world's good treatment, to do the best they can for the general interest, and to be as good and amiable as possible. At the worst, if they cannot make any change on themselves, let them resign themselves to be comparatively poor and neglected, as such is, by the rules of Providence, their inevitable fate.

THE SISTERS OF CHARITY IN BOHEMIA.

In continental countries, much of that charitable ministration which with us is left to rates and institutions, is the work of individuals acting directly under a religious impulse. The difference is perhaps not entirely in favour of the countries of the Romish faith; but there is no denying that it leads to our being presented with pictures of heroic self-devotion and generous self-sacrifice, such as it would be gratifying to see in our own country. Many of the forms of charity met with in Catholic states had their rise in one enthusiastically benevolent man, the celebrated Vincent de St Paul. Born in 1576, on the skirts of the Pyrenees, and brought up as a shepherd-boy—possessed of course of none of the advantages of fortune, this remarkable man shewed a singular spirit of charity before he had reached manhood. He became a priest; he passed through a slavery in one of the African piratical states, and with difficulty made his escape. At length we see him in the position of a parish pastor in France, exerting himself in plans for the improvement of the humbler classes, exactly like those which have become fashionable among ourselves only during the last twenty years. His exertions succeeded, and generous persons of rank enabled him to extend them. In a short time, he saw no fewer than twenty-five establishments founded in his own country, in Piedmont, Poland, and other states, for charitable purposes. Stimulated by this success to increase his exertions, he quickly formed associations of charitable persons, chiefly females, for the succour of distressed humanity. It was a most wonderful movement for the age, and must be held as no little offset against the horrible barbarities arising from religious troubles in the reign of Louis XIII. Among Vincent's happiest efforts, was that which established the *Sisters of Charity*, a sodality of self-devoted women, which exists in vigour at the present day.

During a lengthened residence in Prague, we have had much satisfaction in visiting the establishment of the Sisters, and inquiring into their doings. The house, which was founded in the seventeenth century, and contains seventy inmates, is situated near to the palace of Prince Lobkowitz, in the *Kleine Seite*, or that part of the city which lies on the right bank of the Moldau. It has much the character of a suburban villa, being surrounded by a kind of *plaisance*, enclosed in high walls, and containing shrubberies, alleys, and large clumps of chestnuts. In this pleasant retreat may often be found such of the Sisters as are not engaged in the more pressing kind of duties—never quite idle, however; for, even while seeking recreation, they will be found busied in preparing clothing for the poor, or

perhaps in making medicines from herbs, if not imparting instruction to children let loose from the school which forms a part of their establishment. The place is remarkable for its perfumes, there being assembled here not merely the usual amount of roses, lilacs, jasmynes, tuberoses, and lilies, but a profusion of aromatic plants, cultivated either for medicinal purposes, or to serve in the fabrication of essences and powders, which the Sisters distribute over the world in tiny bottles and small pillow-cases and bags, in order to raise funds for the poor.

In the house, which, having been erected for a private family, is not well suited for its present purpose, everything is an example of cleanliness and order. The hospital is in the main part of the building, and is fitted up with every possible convenience. A large apothecaries' hall is attached to it, furnished with every appliance that medical art has devised, and under the superintendence of a highly-educated professional man. It is most affecting to enter the great sick-room, and see the gentle Sisters in their modest attire ministering to the patients, bending over them with their sweet and cheerful countenances, as if they felt that relief from pain and restoration to life and its enjoyments depended on their smiles. It is scarcely necessary to say, that the hospital is almost always full. Sometimes, indeed, the floor is occupied with extra beds; for the Sisters will never close their doors to any who apply, even though they should have to abandon their own simple places of repose to the new-comer, and stretch themselves on the bare floor.

We observed, in one of our visits, an old woman who was lying in one of the beds of the hospital, in a kind of trance, neither sleeping nor waking, apparently suffering no pain, but quite insensible to everything which passed around her. Her complaint was that of extreme old age, mere physical exhaustion. She had been for many years a pensioner, fed and clothed by the Sisters: having outlived all her relations, and having no friends in the world but them, she had come in, as she said herself, 'to die in peace among them.' Not far from her lay a girl, about sixteen or seventeen years of age, whose extreme paleness, or rather marble whiteness, vied with the snowy sheets which covered all but that lily face; and but for the quivering of the little frill of her cap, and the slow movement of her large blue eyes, it would have been difficult to believe that it was not the alabaster figure of some saint that reposed there. The superior looked kindly and sadly upon her, bent down, kissed her pale forehead, and went on; and though the sufferer did not move or speak, nor the feeble head turn, her large blue eyes followed the reverend mother with an expression which was all its own—an expression to be felt, deeply, intensely, but which cannot be described. And who was she, that pale, silent girl? She was an orphan, neglected by the world, betrayed and abandoned by one who appeared the only friend she had. Crushed in spirit, enfeebled by want and misery, without a roof to shelter her young drooping head, she had been found by the Sisters of Charity sitting alone, *her eyes fixed on the river*. They took her in, clothed, fed, and warmed her. They poured into her heart the blessed words of peace and comfort, till that poor breaking heart gushed forth in a wild tide of feeling too strong for the feeble frame; and we now saw her slowly recovering from a frightful fever, the result of past sufferings, and of that agitation which even a reaction towards hope had occasioned.

It would be too much for the present sketch to describe the many invalids before whom we passed in our visits to the sick-chambers of the Sisters of Charity, though every single case would be a lesson to humanity. The homeless, the forsaken, the orphan, each had his or her own bitter history, previous to reposing within the sanctuary of that blessed retreat; each was attended

by some of those benevolent beings, whose gentle steps and sweet sunny smiles brought peace to their hearts. None who are destitute are rejected at that gate of mercy. Whatever their faults may have been, whatever their frailties, if overtaken by want or sickness—if, deserted and trampled upon, they sink without any visible hand being stretched out to save them from despair and death—then do the Sisters of Charity interpose to succour and to save. To them it is sufficient that the sufferer requires their aid. There every medical assistance is promptly given; every comfort, and even luxury.

Most surprising it is to the common worldling to see these gentle beings thus living entirely for others, seeking no reward but that inspired by Christian promises and hopes. Nor is it mere drudgery and self-denial which constitute their great merit. When humanity calls from the midst of danger, whether in the shape of pestilence or of war, they are equally unflinching. It has been our lot to see a city taken by storm, the streets on fire and half-choked with ruins, and these ruins thickly strewn with the dead and dying. There, before the wild scene had been in the least calmed—amid smoke, and rain, and the frequent rattling fire of musketry—we have seen the black dresses and long white kerchiefs of the Sisters of Charity fitting about, emblems of mercy in a world which might otherwise seem only fit for demons. The place we speak of was Arcis-sur-Aube. Napoleon, who looked on the system of this sisterhood 'as one of the most sublime conceptions of the human mind,' was then in the act of falling back with 30,000 men, after having been attacked the evening before (March 19, 1814) by 130,000 Austrians. He was within three weeks of the prostration of his power, and he must have felt bitterly the crushing reverses he was experiencing. Yet he stopped on the nearly demolished bridge of the town, and ordered 300 Napoleons to be given out of his then scanty resources to the Sisters of Charity, of whose devotion he had been an eye-witness from the commencement of the attack. As he crossed the bridge immediately afterwards, part of it gave way, and he was precipitated into the Aube, but, by the help of his horse, soon gained the safe bank.

The good works of the Sisters do not stop with their exertions for the sick and miserable. They have also their schools for orphans and foundlings. Here the tender human plant, perhaps deserted by a heartless mother, often gains more than it has lost. It is only to infants in these extraordinary circumstances that they are called upon to give shelter, for the children of the poor in general are provided for in public establishments. When we last visited the convent in Prague, we found about thirty girls entertained as inmates. As soon as they are capable of learning, they are instructed in every branch of domestic economy; and as they grow up, and their several talents develop themselves, they are educated accordingly: some for instructresses, either in music or any general branch of education; others, as seamstresses, ladies-maids, cooks, laundry-maids, house-maids. In short, every branch of useful domestic science is taught.

When the girls attain sufficient age and experience to occupy the several situations for which they have been instructed—that is, from seventeen to eighteen, the superior of the convent procures them a place in the family of some of her friends or acquaintance, and always, so far as lies in her power, with a mistress as much as possible suited to the intelligence and instruction of her *protégée*. The day of separation, however, is always painful. It is, in fact, the parting of a mother and her child. We have seen the orphan cling to her adopted mother, and as she knelt to receive her blessing, bathe her hands in tears of gratitude and affection; while the reverend superior would clasp her to her bosom, and recommend to her adopted child the

blessed principles which she had inculcated from her infancy. Nor do they leave the home of their childhood empty. Each girl on quitting the convent is provided with a little *trousseau* or outfit for her first appearance in the world: this consists of two complete suits of clothes—an ordinary and a better one, four petticoats, four chemises, six pair of stockings, the same number of gloves, and two pair of shoes. We have seen many of these orphans and foundlings in after-life; some of them occupying the most respectable situations, as the wives of opulent citizens, and others filling places of the most important trust in some of the highest families of the empire; we have also had several in our own service, and have always had reason to congratulate ourselves on our good-fortune in engaging them.

One of the first principles of education in the orphan schools of the Sisters of Charity is economy: while they spare nothing in the cause of humanity, so far as their means will go, the strictest frugality reigns throughout, and is always inculcated as the foundation of the means of doing good. Consequently, all of whom we have had any experience, who were educated in these charitable institutions, never failed, however humble their situation, to make some little savings: one whom we have at this moment in our eye, and who not many years since served us in the capacity of cook, and fulfilled her charge with great fidelity and zeal, has, by her extraordinary industry and economy, collected in the savings' bank in Prague no less than 700 florins, or £.70 sterling. And yet with all this economy she was so charitable and liberal in giving of her own to the poor, that we have often had to caution her against extravagance in that respect. By this spirit of economy, we have also known several of the orphans and foundlings arrive at a degree of independence which enables them in their turn to assist the deserted generation of to-day, and to do for them as they themselves had been done by. Many also have been the means of rescuing others from crime and starvation by conducting them to that blessed institution, to which, under Heaven, they owe all their prosperity and happiness in life.

Of these charitable communities there are many orders, which differ from the above chiefly in name, and in the Sisters never quitting their sanctuary or the precincts of their gardens. The Sisters of Charity, properly so called, not being vowed to seclusion, are more generally known to the world, who see them, and therefore believe that they exist for charitable purposes, while of those of whom they see nothing they know nothing; and should the casual observer meet in the street on a festival, or day of examination, a column of from 300 to 800 children, from six to ten or twelve years of age, neatly clothed, and whose happy countenances and beautiful behaviour bespeak the care with which their early education has been conducted—it never once occurs to him that these are the children of the poor, the children of the free schools of the 'Sisters' of the Ursuline Convent, or of the Congregation of Notre Dame, or of some other religious establishment of the kind. But perhaps we shall have an opportunity hereafter of introducing these invisible Sisters of Charity to the notice of our readers.

Suffice it now to say, that the 'Sisters of Mercy,' the 'Ursulines,' the 'Congregations of Notre Dame,' the 'English Ladies,' and many others, are all in practice Sisters of Charity.

It is not uncommon to hear their condition deplored, as one from which all earthly enjoyments are excluded, or as a kind of death in life. But personal observation has given us different ideas on this subject. Within those lofty, and sometimes sullen-looking walls which enclose the convents of the sisterhoods we speak of, we have spent some of the most agreeable hours of our life, conversing with refined and enlightened women on

the works of beneficence in which they were engaged; everything bearing an aspect of that cheerfulness and animation which only can be expected in places where worthy duties are well performed.

ADVENTURES OF AN ARMY PHYSICIAN.

ROBERT JACKSON, the son of a small landed proprietor of limited income but respectable character in Lanarkshire, was born in 1750, at Stonebyres, in that county. He received his education first at the barony school of Wandon, and afterwards under the care of Mr Wilson, a teacher of considerable local celebrity at Crawford, one of the wildest spots in the Southern Highlands. He was subsequently apprenticed to Mr William Baillie, of Biggar; and in 1766 proceeded, for the completion of his professional training, to the university of Edinburgh, at that time illustrated and adorned by the genius and learning of such men as the Monros, the Cullens, and the Blacks.

In pursuing his studies at this favoured abode of science and literature, young Jackson is said to have evinced all that purity of morals and singleness of heart which characterised him in after-life, and to have resisted the allurements of dissipation by which, in those days especially, the youthful student was tempted to wander from the paths of virtuous industry. His circumstances were, however, distressingly narrow; and not only was he forced to forego the means of professional improvement open only to the more opulent student; but in order to meet the expenses of the winter-seasons, he was obliged to employ the summer, not in the study but in the practice of his profession. He engaged himself as medical officer to a Greenland whaler, and in two successive summers visited, in that capacity, 'the thrilling regions of thick-ribbed ice,' returning on each occasion with a recruited purse and a frame strengthened and invigorated by exposure and exercise. During these expeditions he occupied his leisure with the study of the Greek and Roman languages, and the careful and repeated perusal of the best authors in both.

His third winter-sessions at Edinburgh having passed away, he was induced to go out and seek his fortune in Jamaica, and accordingly proceeded thither in a vessel commanded by one Captain Cunningham, who had previously been employed as master of a transport at the siege of Havannah. It is far from improbable that it was from his conversations with this individual that Jackson derived those hints, of which at a future time he availed himself, respecting the transmission of troops by sea without injury to their health; but it is quite certain his conviction of the enormous value of cold-water affusions as a curative agent in the last stage of febrile affections, was imbibed from this source.

Arriving in Jamaica, he in 1774 became assistant to an eminent general practitioner at Savana-la-Mar, Dr King, who was also in medical charge of a detachment of the first battalion of the 60th regiment. This latter he consigned to Jackson's care; and well worthy of the trust did our young adventurer, though but twenty-four years of age, approve himself—visiting three or four times a day the quarters of the troops to detect incipient disease, and studying with ardour and intelligent attention the varied phenomena of tropical maladies. Four years thus passed profitably away, and they would have been as pleasant as profitable, but for one circumstance. The existence of slavery and its concomitant horrors appears to have made a deep impression on Jackson's mind, and, at last, to have produced in him such sentiments of disgust and abhorrence, that he resolved on quitting the island altogether, and, as the phrase is, trying his luck in North America, where the revolutionary war was then raging. This resolution—due perhaps, as much to his love of travel as to the motive assigned—was not altogether unfortu-

nate, for shortly after his departure, October 3, 1780, Savana-la-Mar was totally destroyed, and the surrounding country for a considerable distance desolated, by a terrible hurricane and sweeping inroad of the sea, in which Dr King, his family and partner, together with numbers of others, unhappily perished.

The law of Jamaica forbade any one to leave the island without having given previous notice of his intention, or having obtained the bond of some respectable person as security for such debts as he might have outstanding. Jackson, when he embarked for America, had no debts whatever, and was, moreover, ignorant of the law, with whose requirements therefore he did not comply. Nor did he become aware of his mistake until, when off the easternmost point of the island, the master of the vessel approached him and said: 'We are now, sir, off Point-Morant; you will therefore have the goodness to favour me with your security-bond. It is a mere legal form, but we are obliged to respect it.' Finding this 'legal form' had not been complied with, the master then, in spite of Jackson's protestations and entreaties, set him on shore, and the vessel continued on her voyage. What was to be done? Almost penniless, landed on a part of the coast where he knew not a soul, Jackson well-nigh gave himself up to despair. There was a vessel for New York loading, it was true, at Luca; but Luca was 150 miles distant, on the westernmost side of the island, and not to be reached by sea, whilst our adventurer's purse would not suffer him to hire a horse. No choice was left him but to walk, and that in a country where the exigencies of the climate make pedestrianism perilous in the extreme to the white man. Having reached Kingston, which was in the neighbourhood, in a boat, and obtained the necessary certificate, he started on his dangerous expedition, and on the first day walked eighteen miles, being sheltered at night in the house of a benevolent planter. The next day he pushed on for Rio Bueno, which he had almost reached, when, overcome by thirst, he stopped by the way to refresh himself, and imprudently standing in an open piazza exposed to a smart easterly breeze, whilst his lemonade was preparing, contracted a severe chill that almost took from him the power of motion, and left him to crawl along the road slowly and with pain, until he reached his destination.

Having finally arrived, friendless and moneyless, in New York, then in the occupation of the British, he endeavoured first to obtain a commission in the New York volunteers, and afterwards employment as mate in the Naval Hospital. In his endeavours, he was kindly assisted by a Jamaica gentleman, a fellow-passenger, whose regard during the voyage he had succeeded in conciliating by his amiable manners and evident abilities; but his efforts were all in vain, and poor Jackson, familiar with poverty from childhood, began now to experience the misery of destitution. In truth, starvation stared him in the face, and a sense of delicacy withheld him from seeking from his Jamaica friend the most trifling pecuniary assistance. In this, his state of desperation, he determined upon passing the British lines, and endeavouring to obtain amongst the insurgents the food he had hitherto sought in vain; resolving, however, under no circumstances to bear arms against his native country. Whilst moodily and slowly walking towards the British outposts to carry into execution this scheme, having in one pocket a shirt, and in another a Greek Testament and a Homer, he was met half-way by a British officer, who fixed his eyes steadily on him in passing. Jackson in his agitation thought he read in the glance a knowledge of his purpose and a disapprobation of it. Struck by the incident, he turned back, and, after a moment's reflection, resolved on offering himself as a volunteer in the first battalion of the 71st regiment (Sutherland Highlanders), then in cantonment near New York.

Arriving at the place, he presented himself to the notice of Lieutenant-Colonel (afterwards Sir Archibald) Campbell, who, having first ascertained that he was a Scotsman, inquired to whom he was known at New York. Jackson replied, to no one; but that a fellow-passenger from Jamaica would readily testify to his being a gentleman. 'I require no testimony to your being a gentleman,' returned the kind-hearted colonel. 'Your countenance and address satisfy me on that head. I will receive you into the regiment with pleasure; but then I have to inform you, Mr Jackson, that there are seventeen on the list before you, who are of course entitled to prior promotion.' The next day, at the instance of Colonel Campbell, the regimental-surgeon, Dr Stuart, appointed Jackson acting hospital or surgeon's mate—a rank now happily abolished in the British army; for those who filled it, whatever might be their competency or skill, were accounted and treated no better than drudges. Although discharging the duties that now devolve on the assistant-surgeon, they were not, like him, commissioned, but only warrant-officers, and therefore had no title to half-pay.

Dr Stuart, who appears to have been a man superior to vulgar prejudice, and to have appreciated at once the extent of Jackson's acquirements and the vigour of his intellect, relinquished to him, almost without control, the charge of the regimental hospital. Here it was that this able young officer began to put in practice that amended system of army medical treatment which since his time, but in conformity with his teachings, has been so successfully carried out as to reduce the mortality amongst our soldiery from what it formerly was—something like 15 per cent.—to what it is now, about 2½ per cent.

In the army hospitals, at the period Jackson commenced a career that was to eventuate so gloriously, there was no regulated system of diet, no classification of the sick. What are now well known as 'medical comforts,' were things unheard of; the sick soldier, like the healthy soldier, had his ration of salt-beef or pork, and his allowance of rum. The hospital furnished him with no bedding; he must bring his own blanket. Any place would do for an hospital. That in which Jackson began his labours had originally been a commissary's store; but happily its roof was water-tight—an unusual occurrence—and its site being in close proximity to a wood, our active surgeon's mate managed, by the aid of a common fatigue party, to surround the walls with wicker-work platforms, which served the patients as tolerably comfortable couches. A further and still more important change he effected related to the article of diet. He suggested, and the suggestion was adopted—honour to the courageous humanity which did not shrink from so righteous an innovation!—that instead of his salt ration and spirits, which he could not consume, the sick soldier should be supplied with fresh meat, broth, &c.; and that, as the quantity required for the invalid would be necessarily small, the quarter-master should allow the saving on the commuted ration to be expended in the common market on other comforts, such as sago, &c. suitable for the patient. Thus proper hospital diet was furnished, without entailing any additional expense on the state.*

Indefatigable in the discharge of his interesting duties, Mr Jackson speedily obtained the confidence of his military superiors, who remarked with admiration not only his intelligent zeal in performing his hospital functions, but his calmness, quickness of perception,

and generous self-devotion when in the field of battle. On one occasion, although suffering at the time from severe indisposition, he remained, under a heavy fire, succouring the wounded, in spite of the remonstrances of the officers present. On another, having observed the British commander, Colonel (afterwards General) Tarleton, in danger of falling into the hands of the enemy, who had routed the royalist troops, he galloped up to the colonel—whom a musket-ball had just dismounted—pressed him to mount his own horse and escape, whilst he himself, with a white handkerchief displayed, quietly proceeded in the direction of the advancing foe, and surrendered himself at once. The American commander, who did not know what to make of such conduct, asked him who he was? He replied: 'I am assistant-surgeon in the 71st regiment. Many of the men are wounded, and in your hands. I come, therefore, to offer my services in attending them.' He was accordingly sent to the rear as a prisoner; but was well treated, and spent the first night of his captivity in dressing his soldiers' wounds, taking off his shirt, and tearing it up into bandages for the purpose. He afterwards did the same good office for the American sufferers; and when the wounded English could be exchanged, Washington sent him back, not only without exchange, but even without requiring his parole. At a subsequent period during the same unhappy war, when the British under Lord Cornwallis were in full retreat, the sick and wounded were placed in a building which the colonists, on their approach, began to riddle with shot. Several surgeons, not caring to incur the risk of entering so exposed an edifice, agreed to cast lots who should go in and see to the invalids; but Jackson, with characteristic nerve and simplicity, at once stepped forward: 'No, no,' said he, 'I will go and attend to the men!' He did so, and returned unhurt.

After this we find him a prisoner in the hands of the Americans and French at New York Town, Virginia. As on the former occasion, he was treated with all imaginable kindness; and, being released on parole, returned to Europe early in 1782, and proceeded by way of Cork, Dublin, and Greenock to Edinburgh, where he abode for a short time. Thence he started for London; and, desirous of testing the best way of sustaining physical strength during long marches, and urged perhaps also by economical considerations, he resolved to make the journey on foot. His West Indian and American experience had taught him that spare diet consisted best with pedestrian efficiency, and it was accordingly his practice, during this long walk, to abstain from animal food until the close of day, nor often then to partake of it. He would walk some fourteen miles before breakfast—a meal of tea and bread; rest then for an hour or an hour and a half; then pace on until bedtime—a salad, a tart, or sometimes tea and bread, forming his usual evening fare. He found that on this diet he arose every morning at dawn with alacrity, and could prosecute without inconvenience his laborious undertaking. By way of experiment he twice or thrice varied his plan—dining on the road off beefsteaks, and having a draught of porter in the course of the afternoon; but the result justified his anticipations. The stimulus of the beer soon passing off, lassitude succeeded the temporary strength it had lent him; and, worse than all, his disposition to early rising sensibly diminished.

His stay in London, which he reached in this primitive fashion, was not long. His kind friend Dr Stuart, who had exchanged into the Royal Horse-Guards, gave him the shelter of his roof; but so poor was Mr Jackson, that, although ardently desirous of improving himself in his profession, he was unable to attend any one of the medical schools with which London abounds.

The peace of 1783 having opened the continent to the curiosity of the British traveller, Jackson curtly announced to his friends, that 'he was going to take a

* The late Admiral Sir Edward Codrington, when in command, during the war, of a frigate on the coast of Calabria, finding sickness appear amongst his crew, purchased on his own responsibility some bullocks, for the purpose of supplying them with fresh meat. Lord Collingwood having heard of this, and considering it a breach of discipline, sent for Codrington, and addressed him: 'Captain Codrington, pray have you any idea of the price of a bullock in this place?' 'No, my lord,' was the reply, 'I have not; but I know well the value of a British sailor's life!'

walk.' His poverty allowed him no other mode of locomotion; so off he set on the grand tour, carrying with him a map of France, a bundle of clothes, and a scanty supply of money. Crossing the channel, he reached Calais, a place which Horace Walpole, writing from Rome, declared had astonished him more than anything he had elsewhere seen, but in which our adventurer found nothing more astonishing than a superb Swiss regiment. He proceeded to Paris, and thence through Switzerland, by Geneva and Berne, into Germany, at a town of which—Günz in Suabia—he met with a comical enough adventure.

On entering the town he was challenged by a soldier, who, having learned he had no passport, carried him before a magistrate, by whom he was forthwith condemned as a vagabond, and remitted to the custody of a recruiting sergeant. This worthy, in turn, introduced him to the commanding officer, who politely gave our traveller the choice of serving his Imperial and Apostolic Majesty, the Emperor of Germany, either in his cavalry or his infantry forces. But Jackson, strangely insensible to the honour, flatly refused to serve his Majesty in these or any other ways, and desired to be at once set free, and suffered to continue his journey. The officer, doubtless amazed at such presumption, desired the sergeant to convey him to the barracks, where he was placed in a large room, in which were congregated some two hundred or so involuntary recruits like himself—harmless travellers, who, being destitute of passports, the emperor forcibly enlisted into his service. Jackson found his co-mates in misfortune very dirty, very ragged, but perfectly civil and good-tempered. Having a little recovered his serenity—for it is easy to see, though our hero is described as a man of placid demeanour and somewhat Quakerly appearance, he could be not a little fiery at times—he sat down and wrote to the commanding officer, entreating leave to sleep at an inn, and proffering the deposit of all his money as a pledge for his reappearance next morning. The reply was an order that he should surrender his writing materials. At seven o'clock, the appointed sleeping hour, the sergeant returned and gave the signal for bed by rapping with his cane on the floor, which was speedily covered by a number of dirty bags of mouldy straw—the regulation mattresses, it would seem, for involuntary recruits. Jackson—peppery again—refused to lie down, but was at last compelled to do so, and between two of the dirtiest fellows of the lot, each of whom had a leg chained to an arm. The next morning, at his own request, he was brought before the commandant of the town, who had only arrived late the preceding evening, and whom he found seated in his bedroom, 'with all his officers standing round him receiving orders,' says Jackson, 'with more humility than orderly-sergeants.' The commandant repeated the offer of 'cavalry or infantry;' adding that a war was about to commence with the Turks, and that good-behaviour would insure promotion. However, finding Jackson obstinately persistent in his refusal, he quietly observed, in conclusion, that the emperor, as a matter of rule and of right, 'impressed' into his army all such as entered his dominions without certificates of character. 'The order was so tyrannical,' declares our *détenu*, 'that I could not contain myself. "Put me in chains, if you please," I said, "but I tell you, all Germany shall not make me carry a musket for the emperor."' This impetuous burst of indignation seems to have alarmed the phlegmatic commandant, who accordingly let our adventurer go, counselling him, however, to write to the English ambassador at Vienna for a passport, lest he should get into further trouble.

Jackson passed through the Tyrol into Italy, everywhere indulging his love of scenery and still greater love of adventure; studying with all the acuteness of his countrymen the varied characters of the people he met with, and in his correspondence with home friends,

sketching them in language striking for its force, its propriety, and originality. Some of his remarks on men and manners are conceived in a truly Goldsmithian vein, whilst all testify at once to the goodness of his heart and the quickness of his perceptions. At Venice he says that he felt it to be 'such a feast of enjoyment as seldom falls to the lot of man, and never to the lot of any but a poor man, who has nothing conspicuous about him to attract the notice of the crowd,' to possess such facilities as he did for learning what the people of foreign countries really were.

At Albenga, in Piedmont, Jackson arrived one night, tired, hungry, and drenched with rain. Intending to put up at the 'Albergo di San Domenico,' which he had been informed was the best inn, he went by accident to the convent of the same name, and entering, called loudly to be shewn to a private room. 'Instead of telling me I was wrong,' he says, 'the young brethren looked waggish, and began to laugh: when a man is cold and hungry, he can ill brook being the sport of others;' so accordingly—peppery again—he shook his stick angrily at the young monks. And at last one of the most courteous and demure of the number, coming forward, said that although theirs was not exactly a public-house, still the stranger was heartily welcome to walk in, rest, and refresh himself. Discovering his mistake, Jackson of course lost no time in making his bow, his apologies, and acknowledgments.

He returned to England by way of France, having but six sous in his pockets when he reached Bordeaux, where an English merchant, a total stranger, advanced him a few pounds. On the road, he was frequently taken for an Irishman, and not seldom for an Irish priest; under which impression, many civilities were paid him by the simple inhabitants of the country he traversed. Ultimately he landed at Southampton, with just four shillings in his possession; his once black coat having turned a rusty brown, his hat shovel-shaped by ill-usage, and his whole aspect so comical, that the mob hooted him, under the belief that he was a Methodist preacher. Proceeding inland on foot, in the direction of Southampton, he overtook a poor man walking along the road whose looks of unutterable misery induced our traveller to stop and inquire what ailed him. He told Jackson he had a son and daughter dying of a disorder apparently contagious, and that no physician would attend them, as he was too poor to pay the fees. Jackson at once offered his services, which were gratefully accepted. He saw his patients, and prescribed for them, and his heart was touched by their simple expressions of gratitude. 'Their thankfulness,' he says, 'for a thing that would perhaps do them no good, gave me more pleasure than a fee of, I believe, twenty guineas, much in need of it as I was.' The night had gathered in before he reached Winchester, where, at a respectable inn, he partook of such refreshment as his means afforded, and then desired to be shewn to his bedroom. The answer was, that the house contained no bedroom for such as he, and he was finally driven out with the coarsest abuse into the streets. The hour was ten o'clock, the month December, and the severity of the weather may be guessed from the fact, that the snow lay deep on the ground. After wandering about for some time, he at last obtained shelter in a small house in the outskirts of the city. The next day he fared little better. 'On Sunday morning,' he relates, 'I was sixty-four miles from London, and had only one shilling in my pocket. I was hungry, but durst not eat; thirsty, and I durst not drink, for fear of being obliged to lie all night at the side of a hedge in a cold night in December. After dark, I travelled over to Bagshot; was denied admittance into some of the public-houses, ill used in others.' He sought in vain permission even to lie in a barn; but a labourer he fortunately fell in with conducted him to a house, where, at the sacrifice of his last shilling, he

secured at length a bed. The next day—foot-sore, penniless, and starving—he entered London. After remaining there a brief space—January 1784—in spite of the inclement season, he set off, again on foot, to Perth—a journey that occupied him three weeks, as he was detained on the way by some friends whom he visited. At Perth, where his old regiment then lay previous to its disbandment, he amused himself by studying Gaelic, and the controversy respecting Ossian and his poems. Quitting Perth, he travelled, still on foot, through the Highlands, the inhabitants of which he was, in the first instance, disposed to class with savages; but when he had observed the originality of conception, the breadth of humour, and the elevated sentiments which mark the Celt, his opinions underwent a total revolution. He was especially delighted with a ragged old reiver or cattle-lifter whom he encountered, and who had given shelter to the Young Chevalier in the braes of Glenmoriston after the battle of Culloden.

On his return to Edinburgh, Jackson married a lady of fortune, the daughter of Dr Stephenson, and niece of his old friend Colonel Francis Shelley, of the 71st regiment; and was enabled by this accession to his means once again to visit Paris, where he not only resumed his medical studies, but acquired the mastery of several languages, Arabic amongst the rest. Having graduated M.D. at Leyden, he came back again to England, and commenced practice at Stockton-upon-Tees, in Durham. Although his reputation speedily became considerable, especially in cases of fever, he seems scarcely to have liked his new avocation. He found solace, however, in his favourite study of languages, which he pursued with unremitting ardour—constantly reading through the Greek and Latin classics, and not only rendering himself familiar with the best works of the modern continental authors, but also with the literature of the Arabic, Persian, Hebrew, and Gaelic tongues. The *Bostan* of Saadi is said to have been one of his most favourite poems.

On the war breaking out in 1793, Dr Jackson—who, in 1791, had published a valuable work on the fevers of Jamaica and continental America—applied for employment as army-physician; but Mr Hunter, the director-general of the medical department of the army, considering none eligible for such employment who had not served as staff or regimental surgeon, or apothecary to the forces, Jackson agreed to accept, in the first instance, the surgeoncy of the 8d Buffs, on the understanding, that at a future time, he should be nominated physician as he desired. Mr Hunter, however, died soon after this; and his promise was not fulfilled by the Board which succeeded him in the medical direction of the army, and which appears to have pursued Dr Jackson with uniform hostility.

Returning to England with the troops, it was offered to him to accompany, in the capacity of chief medical officer, Sir Ralph Abercromby's expedition against some of the West India islands; and although no employment could possibly have been more agreeable to his taste, he, much to Sir Ralph's chagrin, declined the flattering proposal, on the grounds, that lower terms had been offered to him than to another professional man. Nothing but a sense of professional delicacy, it is plain, governed him in this transaction, for he immediately afterwards embarked (April 1796) as second medical officer in another expedition to San Domingo. During his abode in this island, he was unwearied in enlarging his acquaintance with tropical diseases—observing the rule he had followed in Holland of noting down by the patient's bedside the minutest particulars of every case he attended, the effects of the treatment pursued, and whatever else might shed light on the intricacies of pathological science. He also gave a larger practical operation to the scheme he had years before devised of amending the dietaries of military hospitals.

After the evacuation of San Domingo in 1798, our physician paid a visit to the United States, where he was received with signal distinction, his reputation having preceded him. The latter part of the year found him again at Stockton, publishing a work on contagious and endemic fevers, 'more especially the contagious fever of ships, jails, and hospitals, vulgarly called the yellow-fever of the West Indies;' together with 'an explanation of military discipline and economy, with a scheme for the medical arrangements of armies.' He undertook, about this time, by desire of Count Woronzow, the Russian ambassador, the medical charge of seventeen hundred Russian soldiers, who were stationed in the Channel Islands in a sad state of disease and disorganization; and so admirably did he acquit himself, and so perfect were the hospital provisions he made, that (1800) the commander-in-chief nominated him physician and head of the army-hospital dépôt at Chatham—as he says, 'without any application or knowledge on his part.' This appointment was the cause of his subsequent misfortunes.

At Chatham, with the warm approbation of Major-General Hewett, commanding the dépôt, he introduced that system of hospital reform which had elsewhere operated so successfully. The changes he effected, as soon as they were made, became known to the Medical Board, and were publicly approved of by one of its members. However, shortly afterwards, an epidemic broke out in the dépôt (then removed to the Isle of Wight), arising from the fact, that the barracks were overcrowded with young recruits, but which the Medical Board ascribed to Jackson's innovations, and reported so to the Horse-Guards. The commander-in-chief directed an inquiry to take place before a medical board impanelled for the purpose, and the result of that inquiry may be guessed from a communication made by the War-Office to the commandant of the dépôt. This states 'the unanimous opinion of the Board to have exculpated Dr Jackson from all improper treatment of diseases in the sick,' and the commander-in-chief's gratification, 'that an opportunity has thus been given to that most zealous officer of proving his fitness for the important situation in which he is placed.' The result of this wretched intrigue, however, was that Jackson, disgusted with the whole affair, requested to be placed on half-pay, to which request the Duke of York, with marked reluctance, at last (March 1803) acceded.

In his retirement at Stockton, Jackson put forth two valuable works, one on the medical economy of armies, and another on that of the British army in particular, and was much gratified by an offer to accompany, as military secretary, General Simcoe, just appointed commander-in-chief in India. The general's sudden death, however, put an end to this plan; and Jackson continued at Stockton, addressing frequent representations to government on the defective medical arrangements in the military service—representations the very receipt of which were not acknowledged by Mr Pitt, to whom they were forwarded. The Peninsular war commencing, Dr Jackson was again named Inspector of Hospitals, but was not, thanks to the persevering enmity of the Medical Board, sent on foreign service, although he volunteered to sink his rank, and go in any capacity. The Board even succeeded, by calumnious statements that he had purchased his diploma—statements he readily confuted—in preventing his appointment to the Spanish liberating army; although the British government had formally requested him to accept such an appointment, and agreed to give credentials testifying to his capacity and trustworthiness. This last disappointment led him, in an unguarded moment—peppery to the last—to inflict a slight personal chastisement on the surgeon-general, for which he was imprisoned six months in the King's Bench.

But the triumph of his enemies was not of long duration. In 1810 the Board was dissolved, and the control of the medical department vested in a director-general, with three principal inspectors subordinate to him. Then did Jackson return to active service, and from 1811 to 1815 was employed in the West Indies; his reports from whence embracing every topic relating to medical topography, to sanitary arrangements, and to the observed phenomena of tropical disease, are, it is not too much to say, invaluable. His hints as to the choice of sites for barracks, the propriety of giving to soldiers healthy employment and recreation, as a means of averting sickness, his suggestions as to the treatment of fevers and other endemic diseases, may be found in the various works he has published, embodying the fruits of his West Indian experience.

In 1819, he was sent by government to Spain, where the yellow-fever had broken out, and his report upon its characteristics has been universally admitted to supply the fullest information on the subject that had hitherto been communicated to the public. He availed himself of his presence in that part of Europe to pay a visit to Constantinople and the Levant; and, retaining his energy to the last, when a British force was sent to Portugal in 1827, he desired permission to accompany it. The sands of his life, however, were then fast running out, and on the 6th of April in the same year he died, after a short illness, at Thursby, near Carlisle, in the 77th year of his age. Thus closed a long career of usefulness; for it is not too much to say, that few men of his time laboured harder to benefit his fellow-creatures than did Dr Robert Jackson.

THE MYSTERIOUS LADY.

It is thirty years since we first met the Mysterious Lady at a fashionable sea-side boarding-house, and on our introduction, we found that her brother, General Jerningham, was well known to some members of our family. For five-and-twenty years afterwards she haunted us at intervals; and so singularly and secretly conducted were all her movements, that had she lived in the days of the Inquisition, Miss Jerningham might have proved one of its most valuable agents and coadjutors. She was a thin, middle-aged personage, or, more correctly speaking, of uncertain age, and without anything remarkable in her exterior, which was decidedly lady-like, if we except a pair of the very smallest and most restless brown eyes that were ever set in mortal's head. These eyes expressed suspicion, together with intelligence and close observation. They were clear and sparkling, and shaded by no drooping fringes; and some folks declared that Miss Jerningham slept with her eyes open. On conversing with her, she appeared to have been everywhere and to know everything; but the moment any allusion was made to the future, any attempt to discuss her prospective plans, then did the little brown eyes assume a reddish tinge, their expression passing from suspicion and alarm to the most stubborn resolve. All this was somewhat ludicrous, because nobody really felt particular interest in her movements, or desired to pry into her actions; but on discovering what appeared to be the weak point in her character—because it was out of all proportion strong—idle people, in search of amusement, availed themselves of the knowledge to lead her a very uncomfortable life. Her most intimate friends never knew, for months together, where she was to be found; and it was currently reported that General Jerningham had once advertised in the *Times* for his sister. Certain it is, she always conned the newspapers with avidity, particularly the portion devoted to anonymous communications and the mystical interchange of sentiments; and we frequently suspected that her interest arose from a deeper source than mere curiosity. The simple query: 'Where do you think of passing

this autumn, Miss Jerningham?' threw her into a state of strange excitement; and she always commenced her answer somewhat in the following strain: 'Letters of importance, daily looked for, will determine me—circumstances over which I have no control: it is possible that I may visit Cowes;' but a possibility declared in this way by Miss Jerningham was never known to come to pass. Wherever she chanced to be seen, former acquaintances popped upon her with uplifted hands, exclaiming: 'What! you here? Why, we thought you were at Ilfracombe'—or some other far-away place. 'How long have you been here?—how long do you stay?' were questions easily parried; but if a more searching investigation commenced, then the Mysterious Lady turned, and twisted, and doubled painfully; but somehow always managed to elude and baffle her persecutors.

Miss Jerningham's moral rectitude and unimpeachable propriety of conduct—unsullied by the breath of detraction—rendered her in a great measure impervious to downright ill-nature; but still she was open to teasing and bantering; and the more she was teased, and the more she was bantered, the more impenetrable she became. We endeavoured to find out from herself—but unsuccessfully—if she had always led such a roving kind of existence, and also how it originated; for General Jerningham had a nice villa near the metropolis, and a small, amiable, domestic circle, ready to receive and welcome the wanderer. But no: she came upon them unawares, and at periods when they least expected her, and disappeared again as suddenly, they knew not why nor whither. In this way she vanished from the boarding-house where we first met her, with no intimation of her intention even to our hostess, till her baggage was ready and the coach at the door.

'Where is Miss Jerningham?' was the unanimous cry when she did not appear in her usual place.

'She left us early this morning,' quietly replied the landlady.

'Gone—really gone?' was repeated in various tones of disappointment; and one old gentleman, who had paid the absent lady marked attention, demanded in a chagrined voice: 'Pray, where has she gone? Can you tell us that, ma'am?—heigh!'

'No, sir, I cannot,' replied our hostess. 'All I can say is, that Miss Jerningham is a very honourable and generous lady, and wherever she is, I wish her well.'

'Humph!' said the old gentleman gruffly; 'she must have a good fortune to do as she does.'

'Yes, sir, she must,' was the reply: 'and go where she will, I believe that Miss Jerningham always gives plentiful alms. It seems her settled habit, like.'

'Settled habit!' muttered the old gentleman: 'she hasn't got a settled habit, ma'am: she is a most unsettled and extraordinary individual.'

'Well, sir, perhaps so,' replied Mrs Smith; 'but Miss Jerningham is quite the lady.' And in that opinion we all coincided, supposing our hostess by the word lady to have meant gentlewoman.

A few months afterwards she called upon us in London. She was not staying with her brother, but declined giving her address, remarking that it was not worth while, as she was about to change her abode immediately. By accident, however, we discovered afterwards that Miss Jerningham had lodged for the whole period within a dozen doors of us. Our surprise was lessened in after-years at the pertinacity with which she continued to appear to us, although always at uncertain intervals; for a service rendered by our father, referring to some banking transaction, apparently never escaped her memory, and she invariably alluded to this act of kindness with expressions of gratitude. This circumstance operated, we conjectured, as an encouragement to bestow on us an unusual mark of confidence and friendship, for such Miss Jerningham

considered it when requesting permission to add our address to an advertisement she was about inserting in the *Times* for 'eligible board and lodging.' She knew that newspapers were prohibited articles in our circle, consequently we had no opportunity of finding out that portion of the transaction she wished to conceal. In what locality this 'eligible board and lodging' was advertised for, we never inquired, judging it would be needless to do so, but we consented to receive the letters Miss Jerningham expected in answer.

Poor Miss Jerningham! great was her amazement as well as our own when, in the course of three days, we had amassed for her consideration and perusal no less than seventy-seven letters directed to 'X. Y. Z.' What temptations were held forth in the advertisement which elicited so many replies we never were made acquainted with: Miss Jerningham counted the letters, tied them up, and carried them off in triumph. Next day we received a handsome present of some chimney-ornaments, with 'Miss Jerningham's regards and best thanks;' but we saw no more of the Mysterious Lady for some years. When we did meet again in a quiet country town, she had been to America, and we had experienced vicissitude and bereavement. Our altered mode of living made no difference to Miss Jerningham: she accompanied us home, for we met in the marketplace; but as it is not so easy to keep one's place of abode secret in a small gossiping community, for once in her life she made a virtue of necessity, and openly divulged the fact of her locale, number and all specified. She did not know a creature in the town or in the suburbs—she came there for solitude. Conjecture was afloat in all quarters as to who or what she could be. Some said she must be a gentlewoman, because she wore velvet and satin, and gold chains—moreover, paid well for everything. Others affirmed she might be a gentlewoman—gentlewomen did queer things sometimes—but there must be some very strange reason for a lone and unknown female to drop from the skies, as it were, in the midst of strangers. For our own part, our mind was easier on her account, now that she had broken through her rule of secrecy; and we even hoped that when we saw her again, she might go a step farther, and throw off the veil entirely.

On calling at her lodgings, however, the next day, we learned that the lodger had decamped, after placing in the landlady's hand the solatium of another week's rent, as specified in the agreement—a week's notice or a week's money. Thus, for the space of five-and-twenty years, every now and then, did the Mysterious Lady turn up. Whenever we left home on a visit, we were sure, on our return, to find a card on the table, inscribed with the mystical characters—'Miss Jerningham.' No message left, no address given. The last time we ever saw her was in Hyde Park, walking arm-in-arm with her brother the general; and soon after we heard from the worthy veteran, that 'Bessie had gone on her travels again.'

If Miss Jerningham has really ceased to exist, her end was as mysterious and uncertain as the movements of her life. We say if, because we feel by no means sure on the subject, and should neither faint nor scream if she were to enter the apartment at this moment. It is about five years since General Jerningham set hurriedly off, in considerable dismay, for the scene of a direful conflagration in a northern county, wherein several unfortunate individuals had perished. The fire originated at a hotel, and the General had reasons for fearing that his sister might be among the number of the sufferers, for she was known to have followed that route. A notification likewise had appeared in the public prints, respecting an unknown lady, whose remains awaited the coroner's inquest, but afforded no clue whatever to recognition.

General Jerningham, however, came to the con-

clusion that he indeed beheld the mortal remains of his poor sister, although the only evidence he could obtain was the description given of her appearance by those who had seen her in life. He may have been influenced, likewise, by the fact, that the unfortunate lady had arrived at the hotel only on the previous day, and that no one knew who she was, whence she had come, or whether she was going. After making every possible inquiry, but without obtaining more satisfactory information, the General and his family put on mourning. The shock he had sustained produced bad effects on an already enfeebled constitution, and accelerated the veteran's decease. During his last days, he frequently alluded to 'poor Bessie' in affectionate terms; and we then gathered at least one fact relating to her past history. Her lover, it seems, had been suddenly carried off by malignant fever on the eve of their wedding-day, bequeathing to Bessie all his property; and Bessie, who had never known serious sorrow before, gave no sign, by sigh or lamentation, that she bemoaned the untimely fate of her betrothed, but withdrew herself from friends and connections, and became the restless, homeless, harmless being at whose peculiarities we had so often laughed, little thinking that tears of secret anguish had probably bedewed the pathway of her early wanderings. This very concealment of her grief, however, may have arisen from the peculiar idiosyncrasy which procured for her among all who knew her the name of the Mysterious Lady. But we will not talk of her in the past tense. We are so sure of her being alive, that we are even now anxious to conclude our visit to the pleasant house where this is indited, feeling a presentiment we cannot overcome, that the first interesting object we shall see on returning home is that mystical card which has so often startled and baffled our curiosity—'Miss Jerningham.'

CASH, CORN, AND COAL MARKETS.

A CIRCLE of a few hundred yards only in diameter, of which the centre should be the Duke of Wellington's statue in front of the Royal Exchange, London, would enclose within its magic girdle a far greater amount of real, absolute power, than was ever wielded by the most magnificent conqueror of ancient or modern times. There can be no doubt of this; for is it not the mighty heart of the all but omnipotent money-force of the world, whose aid withheld, invincible armies become suddenly paralysed, and the most gallant fleets that ever floated can neither brave the battle nor the breeze? And this stupendous power, say moralists, has neither a god, a country, nor a conscience! To-day, upon security, it will furnish arms and means to men struggling to rescue their country from oppression, themselves from servitude and chains—to-morrow, upon the assurance of a good dividend, it will pay the wages of the soldiery who have successfully desolated that country, and exterminated or enslaved its defenders. Trite, if sad commonplaces these, to which the world listens, if at all, with impatient indifference. I have not a very strong faith in the soundness of the commercial evangel upon this subject; still, the very last task I should set myself would be a sermon denunciative of mammon-worship—mammon-love—mammon-influence—and so on; and this for two quite sufficient reasons—one, that I have myself, I blushingly confess, a very strong partiality for notes of the governor and company of the Bank of England and sovereigns of full weight and fineness; the other, that the very best and fiercest discourse I ever heard fulminated against the debasing love of gold, especially characteristic, it is said, of these degenerate days, was delivered by a gentleman who, having lived some seventy useful and eloquent years at the rate of about three hundred a year or thereabout, was found to have

died worth upwards of L.60,000, all secured by mortgages bearing 7 per cent. interest on the Brazilian slave-estates of a relative by marriage. But as an illustration of power—and power under any form of development has a singular fascination for most minds—I have thought it may not be uninteresting to glance briefly at a few of the more salient features of the metropolitan mammoth markets.

Standing, then, by the statue of the Iron Duke, we have the Royal Exchange directly in front, Princes Street and the Poultry immediately behind, Lombard Street and Cornhill on the right, Threadneedle Street and Lothbury on the left hand. What an Aladin glitter seems to dance upon the paper as the names of these remarkable localities are jotted down, containing as they do so large a number of world-famous banking and commercial establishments whose operations and influence are limited only by the boundaries of civilisation! Let us look closely at one or two of the chief potentates, principalities, and powers which are there enthroned.

The Royal Exchange, it is well known, owes its origin to the public spirit of Sir Thomas Gresham, who, close upon three centuries ago, built the first Exchange upon the spot now before us. It was destroyed by fire in 1666; the next more costly erection met the same fate in 1888, and has been replaced by the present very handsome edifice. On the entablature is Her Majesty Queen Elizabeth, who inaugurated Sir Richard Gresham's structure—the centre figure of a number of others emblematic of the all-embracing commerce of this country, and surmounted by the words: 'The earth is the Lord's, and the fulness thereof.' If you ascend the steps of the Royal Exchange, and pass into the body of the building, you will find a considerable number of business-looking, sleek, earnest men there, eagerly engaged in canvassing the general affairs of the world, and more especially their own particular ventures, hopes, anticipations, investments therein. If you are an artist, or indeed at all impressionable in matters of taste, you will, I fear, be painfully affected by a marble figure near the centre of the hall, which many persons assert to be a statue of the Queen of these realms—a calumny which I, as a loyal subject, feel bound most emphatically to deny. But the chief interest attached to this building is that it is here the celebrated association known as 'Lloyd's' has its offices—that Lloyd's, whose name is familiar as a household word in every country the sea touches, and who underwrite the maritime ventures of every commercial nation of the globe. Very marvellous has been the rapid development of this gigantic institution, from the small beginnings of a few persons meeting in a coffee-house, till now, when it may be said well-nigh to monopolise the maritime-assurance business of the world. Not even America has been able to set up a rival to it at all worthy of the name; and hundreds of the long-voyage vessels of the States, as well as of all European powers, are insured here. There is, to be sure, a continental association that has borrowed its name without leave, and dubbed itself the 'Austrian Lloyd's'—a designation which forcibly reminds one of the remark of Coleridge when told that Kotzebue assumed to be the German Shakspeare: 'Quite so,' replied the author of the *Ancient Mariner*, 'a very German Shakspeare indeed.' The correspondence of the true Lloyd's is of course immense—enormous: their agents are everywhere; and so admirably regulated does the vast machine appear to be, that litigation between owners and underwriters is almost unknown. This is doubtless one of the causes of the prodigious success of the institution.

There is little more to notice in the Royal Exchange, except that the interior decorations are very tastefully executed; and therefore turn we now to this leviathan Bank of England—to the long, irregular, and by no

means imposing line of building on our left. This is William Cobbett's Old Lady of Threadneedle Street, whose rickety constitution and failing powers—according to that bold and blundering financier—betokened almost immediate dissolution more than a quarter of a century ago. Other men, less dominated by unreasoning prejudice than the author of the 'Political Register,' deceived themselves into the same notion; and it is very possible that there are even now persons who hold the faith as it was in Cobbett—just as we are told in one of Mr Disraeli's novels, that the Greek mythology is still the creed of a fragment of humanity existing somewhere in the mountains of Syria. At all events, since the late Sir Robert Peel placed it beyond the power of the governor and company to indulge in dangerous or erratic courses, it is abundantly manifest that to doubt of the perfect stability of the Bank of England is tantamount to questioning the infallibility of arithmetic. In the vaults and coffers of this huge establishment there is at present—as we learn from the published weekly-returns, a device of Sir Robert's—the bewildering amount of between L.14,000,000 and L.15,000,000 sterling in gold and silver!—a sum of which the figures glide smoothly and glibly enough off the pen or tongue, but a mass of treasure, nevertheless, that few persons can realise to themselves a distinct and accurate conception of. And yet—and what an idea does the fact present of the multitudinous resources, the unrivalled industry, the latent power of this country!—all that heap of precious metals, all that is besides in circulation, with the addition of the bank-note currency, is comparatively nothing when weighed against the true and real exchangeable wealth of Great Britain; wealth of which this coined and convertible paper-money is merely the standard sign of value, the recognised medium by which all things are bartered. It is easy to give one or two significant and startling illustrations of this fact—significant and startling in other respects than in enabling us to see pretty clearly through the currency-cobwebs industriously woven from time to time amongst us. All the money in the three kingdoms, the whole circulating medium of the realm—gold, silver, copper, paper—does not certainly exceed, if it reaches, which is very doubtful, the national revenue for one year, to say nothing of local rates and burdens! And it would, moreover, require all the money circulating in Great Britain and Ireland, including notes to the last farthing, to pay for the spirits, beer, and tobacco consumed annually by the people of the United Kingdom! The note-issues of the Bank of England are about L.19,000,000; its reserve in gold and silver, as we have seen, is upwards of L.14,000,000 sterling: these amounts added together would no more than about discharge the alcohol and weed score of the country for little more than seven months! Lightning-flashes these, that throw vivid gleams over the industrial activity, resources, powers, plague-spots of this mighty, restless, enterprising, but far from sufficiently instructed or disciplined British people.

But let us enter the great money-temple. Very imposing to me has always appeared the army of clerks seated in saturnine silence at the desks, or gliding with grave celerity about the place, and variously employed in balancing enormous accounts, shovelling up heaps of sovereigns, receiving and distributing bank-paper of vast value as coolly and unconcernedly as if engaged in counting out so many chestnuts. A strange feeling must, I suspect, perturb the mind of a newly-appointed clerk amidst all that astounding wealth, until the genius of the place has so moulded his thoughts and perceptions, that he has come to regard himself as but one of the dumb and dead parts of a mighty machine, over whose action he has no more control than he has over the courses of the stars. All these issue, cheque, gold,

bullion departments, with their numerous busy officials, are in truth but the husk and body of the establishment. They by whose will and breath it is animated and directed are nowhere at this hour to be seen. They met on this as on every other morning in their hall of inquisition—the Bank parlour—and decided there, without appeal, without reasons assigned, in the absence of the parties whose commercial reputation was trembling in the balance, upon the course of financial action to be pursued, and upon whose paper should or should not be discounted. A terrible stroke, sharper than a dagger could inflict, politely, blandly as it is performed, is that which falls upon a merchant for the first time informed that the Bank must decline to discount his bills! The announcement is usually received as smilingly as it is made. 'It is a matter of very slight consequence, *etcetera*;' but if you had been near enough, you might have noticed, as the clerk did, the quiver of the lip beneath that sickly smile, and that the face was as white as the rejected paper the merchant's trembling fingers were replacing in his pocket-book. And no wonder that he should be thus agitated, for the refusal has, he well knew, thrust him down the first steps of the steep and slippery descent, at the bottom of which lies bankruptcy—ruin! But these are ordinary downfalls, by the wrecks of which the busy haunts of commercial enterprise are paved; and we have other places to look in at. Before leaving the Bank, however, let us step a few paces to the left of the chief entrance. Now who would believe that in the very midst of this Mammon-temple, where space is of incalculable value, a large plot of greensward should have been jealously preserved, from which spring two fine elms, that from out the heat and turmoil of the place lift up their fresh leaves to the sky—bright, waving leaves, that as often as the sun kisses them, laugh out in sparkling triumph over the heated, anxious, jaded toilers and schemers below? Yet so it is.

Again in Threadneedle Street, and turning to the left, we reach, at the termination of the Bank-front, Bartholomew Lane, famous for nothing that I am aware of, save Capel Court, situate at about the centre, on the right-hand side. At the end of Capel Court is the Stock-Exchange, within whose sacred precincts subscribers only, and their clerks, may enter—a regulation strictly enforced by the liveried guardian at the door. But you can hear enough of the stentorian gabble going on within where we now are. Hark! 'A thousand pounds' consols at 96½–96½. 'Take 'em at 96½,' is the vociferous reply of a buyer. 'Mexican at 27½–27; Portuguese fours at 32½–32½; Spanish fives at 21; Dutch two-and-a-halfs at 50½–50½;' and so roars on the distracting Babel till the hour for closing strikes. Much of this business is no doubt legitimate—the *bona fide* sale and purchase of stock by the brokers, for which they charge their clients the very moderate commission of 2s. 6d. per L.100. The ruinous gambling of the Stock-Exchange is another matter, and is chiefly carried on by 'time' bargains—a sham-business, managed in this way:—A nominally buys of B L.100,000 worth of stock in consols, to be delivered at a fixed price, say 96, on the next settling-day. It is plain that if the market-price of consols shall have fallen, by the day named, to 94, B wins L.2000—the difference between L.100,000 estimated at 96 and 94 per cent. A must pay these L.2000, or, which amounts to the same thing, receive from B consols to the amount of L.100,000 at 96, that in reality are procurable at 94. It is simply and entirely a gambling bet upon what the price of funds will be on the next settling-day. These transactions have been pronounced fraudulent by the superior courts, and liabilities so contracted cannot be legally recovered. It is, for all that, quite certain that these 'debts of honour' entail misery, ruin, often death, on the madmen who habitually peril everything upon the turn of the Stock-Exchange dice—dice loaded, too, by every fraudulent device that

the ingenuity of the two parties engaged in the struggle can discover or invent. To the 'Bears,' who speculate for a fall, national calamity is a God-send. Especially a failure of the harvest, or a great military disaster like that which befell the Cabool expedition, is an almost priceless blessing—a cause of jubilant thanksgiving and joy. The 'Bulls,' on the other hand, whose gains depend upon a rise in the funds, are ever brimful of boasts, and paint all things *coulour de rose*. If the facts bear out the assertions of these bands of *speculators*—we prefer a mild term—why so much the better for the facts; but if not, sham-facts will answer the purpose, and to manufacture *them* 'is as easy as lying.' It is a remarkable fact, by the way, that out of the multitude of British fundholders there are not more than about 25,000 persons who are liable from that source to the income-tax—that is, who receive dividends to the amount of L.150 and upwards annually. The most numerous class of the national creditors eleven years ago—and there has, we believe, been no later return—were those whose annual dividends did not exceed L.50. These numbered 98,946: the next largest class, 85,069, were creditors whose yearly dividends did not exceed L.5; whilst only 192 persons were in the receipt of annual dividends exceeding L.2000.

But leaving these haunts of money-dealers, let us pass over to Leadenhall Street, turn down Billiter Street, and walk on till we reach Mark Lane and the plain, spacious, substantial, Doric-fronted building on the left hand, in which the great London Corn Market is held every Monday, Wednesday, and Friday—the chief market, however, being that of Monday. There are no clamorous shoutings here. These crowds of staid, well-dressed, respectable people fly no kites, deal in no flimsy paper-schemes and shares. Their commerce is in corn, flour, seeds—the sustenance of man, in short. There are sober traders in realities, and the busy hum of voices has a smack of healthy traffic in it. It would so appear at all events, if we care not to look beneath the surface; and, in sooth, since the abolition of the sliding-scale has rendered the corn-supply continuous and regular as other staples, gambling to any ruinous extent has become almost impossible.

There is another great change apparent here; albeit this has been a very gradual one. A stranger will have remarked with surprise that there are but few, very few, of the knee-breeched, top-booted, double-chinned, jolly, old-class farmers amongst the numerous groups who are either watching their sample-bags and waiting for customers, or chewing and smelling handfuls of wheat and barley, and casting what they do not swallow on the flags, already carpeted with grain. Still in addition to a strong sprinkling of 'Friends,' there are, he perceives, a goodly number of stalwart, handsomely-dressed individuals, many of them wearing kid gloves, and carrying silk umbrellas neatly ensconced in oil-skin cases. There is a group, one of whom has just refused 45s. per quarter for a sample of prime white wheat. If we approach nearer to them, we shall perhaps discover their quality. As I guessed! These gentlemen are distressed agriculturists, who prefer selling their own corn to sending it to any of the numerous highly-respectable salesmen who occupy the offices round the two markets. There are scores here of these well-attired, healthy-faced, hearty-looking, stout-limbed, but distressed individuals present, with not one of whom I should have the slightest objection to dine to-day, or on any other day, for that matter. But we must beware of rash judgments. Appearances are often deceitful, and we know, besides, from high authority, that grief is apt to puff up and swell a man sadly at times.

There is no possibility, an eminent salesman informed us, of making even a proximate guess at the quantity of business done; neither, it appears, is there any reliance to be placed upon the amount of 'arrivals' as

given, either in the newspapers, or in the private circulars issued weekly to the trade. Corn, in this market, is usually sold at a month's credit, with discount for cash. The buyer secures a sample of his purchase in a small canvas bag, and the seller is of course bound to deliver the quantity agreed for at the same weight and quality. There is one patent fact highly creditable to our British cultivators, which I gather from a trade-circular dated September 29, 1851, and this is, that foreign grains, wheats especially, do not command anything like such prices as the English varieties. The highest price of English white wheat is set down at 45s. per quarter; all foreign wheat is marked considerably lower: Russian is quoted at from 31s. to 38s.; whilst Egyptian and Turkish are marked from 24s. to 26s. per quarter; and fine American flour is quoted at a price considerably under 'English Households.' These are not signs of decrepit or faint-hearted farming.

Being so near, we may as well look in for a few moments at the New Coal Exchange opposite Billingsgate Market; a sightly, circular building, of rich interior decoration, that will well repay a visit. It is one of our newest 'lions,' and is certainly a very significant sign and monument of the enormous and swiftly-increasing commercial activity of the country. On the tessellated wooden floor—with the anchor in the centre, an emblem not long to be appropriate to such a place, as we shall presently see—thousands of tons of coal are disposed of with marvellous rapidity; the days of sale being the same as those of the Mark-Lane Market.

There was a coal-tax, popularly known as the Richmond duty, which was levied for many years, for the benefit of one family, but was abolished some time ago. Its origin, and the especial circumstance which, gossip saith, more immediately led to its infliction, are not a little curious, perhaps instructive. The first Duke of Richmond of the present line was a son of Charles II. by Louise Renée de Pennevant de Querouaille, a French lady, better known to us as the Duchess of Portsmouth, to whom Otway dedicated his 'Venice Preserved' in such adulatory terms. This son, when only nine years of age, was created a Knight of the most noble Order of the Garter; and his mother, with the proverbial taste of her country, arranged a more graceful mode of wearing the blue ribbon, which, as we see in old portraits, was till then worn round the neck of the knight, with the George pendent from it. The duchess presented her son to the king with the ribbon thrown gracefully over his left shoulder, and the George pendent on the right side. His majesty was delighted, embraced his son, commanded that the insignia of the order should always be so worn, presented the youthful knight with 1s. per ton, Newcastle measure, upon all coals shipped in the Tyne for consumption in England, and secured the munificent parental gift by patent to the young duke and his heirs for ever. *Hôni soit qui mal y pense.*

After the fortunate family had enjoyed this revenue for about a century and a quarter, the then Duke of Richmond, a personage said to be wise in his generation, negotiated the sale of his patent with the government; and on the 19th of August 1799 the Lords of the Treasury agreed that the sum of L.499,833, 11s. 6d., the price of a perpetual annuity of L.19,000, should be paid for the surrender of the duke's right. This enormous sum was accordingly actually disbursed by the Exchequer in two payments, and the obnoxious impost on the Tyne coal-trade was abolished some thirty years afterwards—by which time the Treasury had been repaid much more than it had advanced, a circumstance inducing a belief that his Grace sold his inheritance much too cheaply. The estimate of the quantity of coals consumed in the United Kingdom, and

exported during the last year, reaches the staggering amount of 50,000,000 of tons—a tremendous advance, which proves, if nothing else, that if, as some will have it, we are an 'old' country, the capacity for hard work as well as power of consumption increases marvellously with age. At anyrate the three great business localities I have partially indicated are stupendous facts, the full significance of which will be fully comprehended by all and every one who may choose to compare these slight outline sketches with the great originals.

STORY OF REMBRANDT.

At a short distance from Leyden may still be seen a flour-mill with a quaint old dwelling-house attached, which bears, on a brick in a corner of the wide chimney, the date 1550. Here, in 1606, was born Paul Rembrandt. At an early age he manifested a stubborn, independent will, which his father tried in vain to subdue. He caused his son to work in the mill, intending that he should succeed him in its management; but the boy shewed so decided a distaste for the employment, that his father resolved to make him a priest, and sent him to study at Leyden. Every one knows, however, that few lads of fifteen, endowed with great muscular vigour and abundance of animal spirits, will take naturally and without compulsion to the study of Latin grammar. Rembrandt certainly did not; and his obstinacy proving an overmatch for his teachers' patience, he was sent back to the mill, when his father beat him so severely, that next morning he ran off to Leyden, without in the least knowing how he should live there. Fortunately he sought refuge in the house of an honest artist, Van Zwaanenberg, who was acquainted with his father.

'Tell me, Paul,' asked his friend, 'what do you mean to do with yourself, if you will not be either a priest or a miller? They are both honourable professions: one gives food to the soul, the other prepares it for the body.'

'Very likely,' replied the boy; 'but I don't fancy either; for in order to be a priest, one must learn Latin; and to be a miller, one must bear to be beaten. How do you earn your bread?'

'You know very well I am a painter.'

'Then I will be one too, Herr Zwaanenberg; and if you will go to-morrow and tell my father so, you will do me a great service.'

The good-natured artist willingly undertook the mission, and acquainted the old miller with his son's resolution.

'I want to know one thing,' said Master Rembrandt; 'will he be able to gain a livelihood by painting?'

'Certainly, and perhaps make a fortune.'

'Then if you will teach him, I consent.'

Thus Paul became the pupil of Van Zwaanenberg, and made rapid progress in the elementary parts of his profession. Impatient to produce some finished work, he did not give himself time to acquire purity of style, but astonished his master by his precocious skill in grouping figures, and producing marvellous effects of light and shade. The first lessons which he took in perspective having wearied him, he thought of a shorter method, and invented perspective for himself.

One of his first rude sketches happened to fall into the hands of a citizen of Leyden who understood painting. Despite of its evident defects, the germs of rare talent which it evinced struck the burgomaster; and sending for the young artist, he offered to give him a recommendation to a celebrated painter living at Amsterdam, under whom he would have far more opportunity of improvement than with his present instructor.

Rembrandt accepted the offer, and during the following year toiled incessantly. Meantime his finances were dreadfully straitened; for his father, finding that the expected profits were very tardy, refused to give money to support his son, as he said, in idleness. Paul, however, was not discouraged. Although far from possessing an amiable or estimable disposition, he held a firm and just opinion of his own powers, and resolved to make these subservient first to fortune and then to fame. Thus while some of his companions, having finished their preliminary studies, repaired to Florence, to Bologna, or to Rome, Paul, determined, as he said, not to lose his own style by becoming an imitator of even the mightiest masters, betook himself to his paternal mill. At first his return resembled that of the Prodigal Son. His father believed that he had come to resume his miller's work; and bitter was his disappointment at finding his son resolved not to renounce painting.

With a very bad grace he allowed Paul to displace the flour-sacks on an upper loft, in order to make a sort of studio, lighted by only one narrow window in the roof. There Paul painted his first finished picture. It was a *portrait of the mill*. There, on the canvas, was seen the old miller, lighted by a lantern which he carried in his hand, giving directions to his men, occupied in ranging sacks in the dark recesses of the granary. One ray falls on the fresh, comely countenance of his mother, who has her foot on the last step of a wooden staircase.* Rembrandt took this painting to the Hague, and sold it for 100 florins. In order to return with more speed, he took his place in the public coach. When the passengers stopped to dine, Rembrandt, fearing to lose his treasure, remained in the carriage. The careless stable-boy who brought the horses their corn forgot to unharness them, and as soon as they had finished eating, excited probably by Rembrandt, who cared not for his fellow-passengers, the animals started off for Leyden, and quietly halted at their accustomed inn. Our painter then got out, and repaired with his money to the mill.

Great was his father's joy. At length these silly daubs, which had so often excited his angry contempt, seemed likely to be transmuted into gold, and the old man's imagination took a rapturous flight. 'Neither he nor his old horse,' he said, 'need now work any longer; they might both enjoy quiet during the remainder of their lives. Paul would paint pictures, and support the whole household in affluence.'

Such was the old man's castle in the air; his clever, selfish son soon demolished it. 'This sum of money,' he said, 'is only a lucky windfall. If you indeed wish it to become the foundation of my fortune, give me one hundred florins besides, and let me return to Amsterdam: there I must work and study hard.'

It would be difficult to describe old Rembrandt's disappointment. Slowly, reluctantly, and one by one, he drew forth the 100 florins from his strong-box. Paul took them, and with small show of gratitude, returned to Amsterdam. In a short time his fame became established as the greatest and most original of living artists. He had a host of imitators, but all failed miserably in their attempts at reproducing his marvellous effects of light and shade. Yet Rembrandt prized the gold which flowed into him far more than the glory. While mingling the colours which were to flash out on his canvas in real living light, he thought but of his dingy coffers.

When in possession of a yearly income equal to L.2000 sterling, he would not permit the agent who collected his rents to bring them in from the country to Amsterdam, lest he should be obliged to invite him to dinner. He preferred setting out on a fine day, and going himself to the agent's house. In this way he

saved two dinners—the one which he got, and the one he avoided giving. 'So that's well managed!' he used to say.

This sordid disposition often exposed him to practical jokes from his pupils; but he possessed a quiet temper, and was not easily annoyed. One day a rich citizen came in, and asked him the price of a certain picture.

'Two hundred florins,' said Rembrandt.

'Agreed,' said his visitor. 'I will pay you to-morrow, when I send for the picture.'

About an hour afterwards a letter was handed to the painter. Its contents were as follow: 'MASTER REMBRANDT—During your absence a few days since, I saw in your studio a picture representing an old woman churning butter. I was enchanted with it; and if you will let me purchase it for 800 florins, I pray you to bring it to my house, and be my guest for the day.' The letter was signed with some fictitious name, and bore the address of a village several leagues distant from Amsterdam.

Tempted by the additional 100 florins, and caring little for breaking his engagement, Rembrandt set out early next morning with his picture. He walked for four hours without finding his obliging correspondent, and at length, worn out with fatigue, he returned home. He found the citizen in his studio, waiting for the picture. As Rembrandt, however, did not despair of finding the man of the 800 florins, and as a falsehood troubled but little his blunted conscience, he said: 'Alas! an accident has happened to the picture; the canvas was injured, and I felt so vexed that I threw it into the fire. Two hundred florins gone! However, it will be my loss, not yours, for I will paint another precisely similar, and it shall be ready for you by this time to-morrow.'

'I am sorry,' replied the amateur, 'but it was the picture you have burned which I wished to have; and as that is gone, I shall not trouble you to paint another.'

So he departed, and Rembrandt shortly afterwards received a second letter to the following effect: 'MASTER REMBRANDT—You have broken your engagement, told a falsehood, wearied yourself to death, and lost the sale of your picture—all by listening to the dictates of avarice. Let this lesson be a warning to you in future.'

'So,' said the painter, looking round at his pupils, 'one of you must have played me this pretty trick. Well, well, I forgive it. You young varlets do not know the value of a florin as I know it.'

Sometimes the students nailed small copper coins on the floor, for the mischievous pleasure of seeing their master, who suffered much from rheumatism in the back, stoop with pain and difficulty, and try in vain to pick them up.

Rembrandt married an ignorant peasant who had served him as cook; thinking this a more economical alliance than one with a person of refined mind and habits. He and his wife usually dined on brown bread, salt herrings, and small beer. He occasionally took portraits at a high price, and in this way became acquainted with the Burgomaster Six, a man of enlarged mind and unblemished character, who yet continued faithfully attached to the avaricious painter. His friendship was sometimes put to a severe test by such occurrences as the following:—

Rembrandt remarked one day that the price of his engravings had fallen.

'You are insatiable,' said the burgomaster.

'Perhaps so. I cannot help thirsting for gold.'

'You are a miser.'

'True: and I shall be one all my life.'

'Tis really a pity,' remarked his friend, 'that you will not be able after death to act as your own treasurer, for whenever that event occurs, all your works will rise to treble their present value.'

* This picture is believed to be no longer in existence. I have found its description in the work of the historian Decamps.

A bright idea struck Rembrandt. He returned home, went to bed, desired his wife and his son Titus to scatter straw before the door, and give out, first, that he was dangerously ill, and then dead—while the simulated fever was to be of so dreadfully infectious a nature that none of the neighbours were to be admitted near the sick-room. These instructions were followed to the letter; and the disconsolate widow proclaimed that, in order to procure money for her husband's interment, she must sell all his works, any property that he left not being available on so short a notice.

The unworthy trick succeeded. The sale, including every trivial scrap of painting or engraving, realised an enormous sum, and Rembrandt was in ecstasy. The honest burgomaster, however, was nearly frightened into a fit of apoplexy at seeing the man whose death he had sincerely mourned standing alive and well at the door of his studio. Meinherr Six obliged him to promise that he would in future abstain from such abominable deceptions. One day he was employed in painting in a group the likenesses of the whole family of a rich citizen. He had nearly finished it, when intelligence was brought him of the death of a tame ape which he greatly loved. The creature had fallen off the roof of the house into the street. Without interrupting his work, Rembrandt burst into loud lamentations, and after some time announced that the piece was finished. The whole family advanced to look at it, and what was their horror to see introduced between the heads of the eldest son and daughter an exact likeness of the dear departed ape. With one voice they all exclaimed against this singular relative which it had pleased the painter to introduce amongst them, and insisted on his effacing it.

'What!' exclaimed Rembrandt, 'efface the finest figure in the picture? No, indeed; I prefer keeping the piece for myself.' Which he did, and carried off the painting.

Of Rembrandt's style it may be said that he painted with light, for frequently an object was indicated merely by the projection of a shadow on a wall. Often a luminous spot suggested, rather than defined, a hand or a head. Yet there is nothing vague in his paintings: the mind seizes the design immediately. His studio was a circular room, lighted by several narrow slits, so contrived that rays of sunshine entered through only one at a time, and thus produced strange effects of light and shade. The room was filled with old-world furniture, which made it resemble an antiquary's museum. There were heaped up in the most picturesque confusion curious old furniture, antique armour, gorgeously-tinted stuffs; and these Rembrandt arranged in different forms and positions, so as to vary the effects of light and colour. This he called 'making his models sit to him.' And in this close adherence to reality consisted the great secret of his art. It is strange that his favourite amongst all his pupils was the one whose style least resembled his own—Gerard Douw—he who aimed at the most excessive minuteness of delineation, who stopped key-holes lest a particle of dust should fall on his palette, who gloried in representing the effects of fresh scouring on the side of a kettle.

Rembrandt died in 1674, at the age of sixty-eight. He passed all his life at Amsterdam. Some of his biographers have told erroneously that he once visited Italy: they were deceived by the word *Venetis* placed at the bottom of several of his engravings. He wrote it there with the intention of deluding his countrymen into the belief that he was absent, and about to settle in Italy—an impression which would materially raise the price of his productions. Strange and sad it is to see so much genius united with so much meanness—the head of fine gold with the feet of clay.*

* Abridged from the French of J. de Châtillon.

ELECTIONEERING CURIOSITY.

[In giving the following address of an American candidate, we must beg our readers to understand that it is not intended as a joke. Electioneering in the States, generally speaking, is carried on with good-humour; and when there is no real cause of squabbling, the object of the aspirant is to get the laugh in his favour. The orator we introduce to the English public is Mr Daniel R. Russell, a candidate for the Auditorship in Mississippi.]

LADIES AND GENTLEMEN—I rise—but there is no use telling you that; you know I am up as well as I do. I am a modest man—very—but I never lost a picayune by it in my life. Being a scarce commodity among candidates, I thought I would mention it, for fear if I did not, you never would hear it. Candidates are generally considered as nuisances, but they are not; they are the politest men in the world, shake you by the hand, ask how's your family, what's the prospect for crops, &c.—and I am the politest man in the state. Davy Crockett says the politest man he ever saw, when he asked a man to drink, turned his back so that he might drink as much as he pleased. I beat that all hollow: I give a man a chance to drink twice if he wishes, for I not only turn my back, but shut my eyes! I am not only the politest man, but the best electioneerer: you ought to see me shaking hands with the vibrations, the pump-handle and pendulum, the cross-cut and wiggle-waggle. I understand the science perfectly, and if any of the country candidates wish instructions, they must call upon me. Fellow-citizens, I was born—if I hadn't been I wouldn't have been a candidate; but I am going to tell you where: 'twas in Mississippi, but 'twas on the right side of the negro line; yet that is no compliment, as the negroes are mostly born on the same side. I started in the world as poor as a church-mouse, yet I came honestly by my poverty, for I inherited it; and if I did start poor, no man can say but that I have held my own remarkably well. Candidates generally tell you—if you think they are qualified, &c. Now, I don't ask your thoughts, I ask your votes. Why, there is nothing to think of except to watch and see that Swan's name is not on the ticket; if so, *think* to scratch it off and put mine on. I am certain that I am competent, for who ought to know better than I do! Nobody. I will allow that Swan is the best auditor in the state; that is, till I am elected: then perhaps it's not proper for me to say anything more. Yet, as an honest man, I am bound to say that I believe it's a grievous sin to hide anything from my fellow-citizens; therefore say that it's my private opinion, publicly expressed, that I'll make the best auditor ever in the United States. 'Tis not for honour I wish to be auditor; for in my own county I was offered an office that was all honour—coroner, which I respectfully declined. The auditor's office is worth some 5000 dollars a year, and I am in for it like a thousand of brick. To shew my goodness of heart, I'll make this offer to my competitor. I'm sure of being elected, and he will lose something by the canvass, therefore I am willing to divide equally with him, and make these offers: I'll take the salary, and he may have the honour, or he may have the honour, and I'll take the salary.

In the way of honours, I have received enough to satisfy me for life. I went out to Mexico, ate pork and beans, slept in the rain and mud, and swallowed everything but live Mexicans. When I was ordered to go, I went; 'charge,' I charged; and 'break for the chapel!'—you had better believe I beat a quarter nag in doing my duty.

My competitor, Swan, is a bird of golden plumage, who has been swimming for the last four years in the auditor's pond at 5000 dollars a year. I am for rotation. I want to rotate him out, and to rotate myself in. There's a plenty of room for him to swim outside of that pond; therefore *pop* in your votes for me—I'll *pop* him out, and *pop* myself in.

I am for a division of labour. Swan says he has to work all the time, with his nose down upon the public grindstone. Four years must have ground it to a *pint*. Poor fellow! the public ought not to insist on having the

handle of his mug ground clean off. I have a large, full-grown, and well-blown nose, red as a beet, and tough as sole-leather. I rush to the post of duty; I offer it up as a sacrifice; I clap it on the grindstone. Fellow-citizens, grind till I *holler enuff*—that'll be some time first, for I'll hang like grim death to a dead African.

Time's most out. Well, I like to forgot to tell you my name. It's Daniel; for short, Dan. Not a handsome name, for my parents were poor people, who lived where the quality appropriated all the nice names; therefore they had to take what was left and divide around among us—but it's as handsome as I am—D. Russell. Remember, all and every one of you, that it's not Swan.

I am sure to be elected; so, one and all, great and small, short and tall, when you come down to Jackson after the election, stop at the auditor's office—the latch-string always hangs out; enter without knocking, take off your things, and make yourself at home.

A NEGRO'S ACCOUNT OF LIBERIA.

All of you that feel like it, my friends, come on home—the bush is cleared away—you can hear no one say there is nothing to eat here. Why, one man, Gabriel Moore, brought better than 200 cattle from the interior this year—another 100—some 60, some 50, &c. There are no hogs there, they say—no turkeys—why, I saw 50 or 60 in the street at Millsburg the other day. No horses: I have got four in my stable now; I have a mare and two colts, and I have a horse that I have been offered 100 dollars for here; if you had him he would bring 500. If you don't believe it, let some gentleman send me a buggy or a single gig—you shall see how myself and wife will take pleasure, going from town to town—throw the harness in too—any gentleman that feels like it—white or coloured—and I will try to send him a boa constrictor to take his comfort; I know how to take the gentleman without any danger. My oxen I was working them yesterday; and as for goats and sheep, we have a plenty. We have a plenty to eat, every man that will half work. I give you this; you are all writing to me to tell you about Liberia, what we eat, and all the news—I mean my coloured friends. Yours truly, ZION HARRIS.

LARD-CANDLES.

One of the most important discoveries or improvements of the age, is a new species of candle which has been recently made in Cincinnati, and which will shortly be offered extensively for sale. It is calculated to supersede all other kinds in use by its beauty, freedom from guttering, hardness, and capacity of giving light, in all which respects it is superior to every other species of candle. This candle is nearly translucent, and can be made to exhibit the wick, when the candle is held up between the eye and the light, while the surface is as glossy as polished wax or varnish. The principal ingredient is lard; and the value of this manufacture can be hardly exaggerated. Taking durability into account, it can be made as cheap as any other candle; and there exists no single element of comfort, convenience, profit, and economy, in which this article has not the advantage of sperm, star, wax, or tallow candles. It will be readily conceded that the days of all other portable or table light, including lard-oil, are numbered. In fact, except where intense light, as in public buildings, is an object, gas itself cannot compete with it for public favour.—*American Paper.*

CALIFORNIA ITEMS.

Some idea of the traffic between San Francisco and the southern mines may be formed from the fact, that there are at this moment ten steamers plying between San Francisco and Sacramento. The latter are for the most part of a larger size than those on the San Joaquin river; and make the trip of about 120 miles in from seven to eight hours. In the elegance of their accommodations and the luxuries of their larder, they might compare favourably with any passenger-vessels in the world. There are ten other steamers plying from Sacramento to different

places above that city. One year ago there was but one steamboat in Oregon—the *Columbia*; now there are eleven of different kinds running in the Columbia and Willamette rivers, not including the Pacific steamers, *Sea-gull* and *Columbia*, running between Oregon and California.

THE NOBLE MARINER.

BY THE REV. JAMES GILBORNE LYONS, LL.D.

Most readers of these lines will remember that when the ship *Ocean Monarch* was burned off Liverpool on the 24th of August 1846, Frederick Jerome of New York saved fifteen lives by an act of singular courage and benevolence. They will also lament that one so ready to help others should himself perish by violence: he was killed in Central America in the autumn of 1851.

SHOUT the noble seaman's name,
Deeds like *his* belong to fame;
Cottage roof and kingly done,
Sound the praise of brave Jerome.
Let his acts be told and sung,
While his own high Saxon tongue—
Herald meet for worth sublime—
Peals from conquered clime to clime.

Madly rolled the giant wreck,
Fiercely blazed the riven deck;
Thick and fast as falling stars,
Crashed the flaming blocks and spars;
Loud as surf, when winds are strong,
Wailed the scorched and stricken throng,
Gazing on a rugged shore,
Fires behind, and seas before.

On the charred and reeling prow
Left of hope, they gather now,
Finding, one by one, a grave
In the vexed and sullen wave.
Here the child, as if in sleep,
Floats on waters dark and deep;
There the mother sinks below,
Shrieking in her mighty woe.

Britons, quick to strive or feel,
Joined with chiefs of rich Brazil;
Western freemen, prompt to dare,
Side by side with Bourbon's heir;
Proving who could *then* excel,
Came with succour long and well;
But Jerome, in peril nursed,
Shone among the foremost—*first*.

Through the reddened surge and spray,
Fast he cleaves his troubled way;
Boldly climbs and stoutly clings,
On the smoking timber springs;
Fronts the flames, nor fears to stand
In that lorn and weeping band;
Looks on death, nor tries to shun,
Till his work of love is done.

Glorious man!—immortal work!—
Claim thy hero, proud New York;
Harp of him when feasts are spread,
Tomb him with thy valiant dead.
Who that, bent on just renown,
Seeks a Christian's prize and crown,
Would not spurn whole years of life,
For one hour of such a strife!

THE WOLF-GATHERING.

ONE winter evening some years ago, I sat with a small circle of friends round the fire, in the house of a Polish gentleman, whom his acquaintances agreed in calling Mr Charles, as the most pronounceable of his names. He had fought in all his country's battles of the unsuccessful revolution of 1831; and being one of the many who sought life and liberty in the British dominions, on the failure of that last national effort, he had, with a spirit worthy of an exiled patriot, made the best of his unchosen fortunes, and worked his way up, through a thousand difficulties and privations, to a respectable standing in the mercantile profession. At the period mentioned, Mr Charles had become almost naturalised in one of our great commercial towns, was a member of a British church, and the head of a British household; but when the conversation happened to turn on sporting matters round his own fireside, he related in perfect seriousness the following wild and legend-like story of his early life in Poland:—

The year before the rising, I went from my native place in Samogitia (Szamait), to spend Christmas at the house of my uncle, situated in the wooded country of Upper Lithuania. He was a nobleman who boasted his descent from one of the oldest houses in Poland, and still held the estate which his ancestors had defended for themselves through many a Tartar invasion—as much land as a hunting-train could course over in a summer's day. But ample as his domain appeared, my uncle was by no means rich upon it. The greater portion had been forest-land for ages; elsewhere it was occupied by poor peasants and their fields; and in the centre he lived, after the fashion of his forefathers, in a huge timber-house with antiquated fortifications, where he exercised liberal hospitality, especially at Christmas times. My uncle was a widower, but he had three sons—Armand, Henrique, and Constantine—brave, handsome young men, who kept close intimacy and right merry companionship with their nearest neighbours, a family named Lorenski. Their property bordered on my uncle's land, and there was not a family of their station within leagues; but independently of that circumstance, the household must have had attractions for my cousins, for it consisted of the young Count Emerich, his sister Constanza, and two orphan cousins, Marcella and Eustachia, who had been brought up with them from childhood.

The count's parents had died in his early youth, leaving him not only his own guardian, but that of his sister and cousins; and the young people had grown up safely and happily together in that forest-land. The cousins were like most of our Polish girls in the

provinces, dark-eyed and comely, gay and fearless, and ready alike for the dance or the chase; but Count Emerich and his sister had the praise of the whole province for their noble carriage, their wise and virtuous lives, and the great affection that was between them. Both had strange courage, and were said to fear neither ghost nor goblin—which, I must remark, was not a common case in Lithuania. Constanza was the oldest by two years, and by far the most discreet and calm of temper, by which it was believed she rather ruled the household, though her brother had a high and fiery spirit. But they were never known to disagree, and, though still young, neither seemed to think of marrying. Fortunately, it was not so with all their neighbours. My stay at my uncle's house had not been long when I found out that Armand was as good as engaged to Marcella, and Henrique to Eustachia, while Constantine, the youngest and handsomest of the three brothers, paid vain though deferential court to Constanza.

The rising was not then publicly talked of, though known to be in full preparation throughout the country. All the young and brave hearts among us were pledged to it, and my cousins did not hesitate to tell me in confidence that Count Emerich and his sister were its chief promoters in that district. They had a devoted assistant in Father Cassimer. He had been their mother's confessor, and lived in the house for five-and-thirty years, saying mass regularly in the parish church, a pine-built edifice on the edge of the forest. Father Cassimer's hair was like snow; but he was still erect, strong, and active. He said the church could not spare him, and he would live to a hundred. In some respects, the man did deserve a century, being a good Pole and a worthy priest, notwithstanding one weakness which beset him, for Father Cassimer took special delight in hunting. It was said that once, when robed for mass, a wild boar chanced to stray past; whereon the good priest mounted his horse, which was usually fastened to the church-door, and started after the game in full canonicals. That was in his youth; but Father Cassimer never denied the tale, and the peasants who remembered it had no less confidence in his prayers, for they knew he loved his country, and looked after the sick and poor. The priest was my cousin's instructor in wood-craft, and the boon-companion of my uncle; but scarcely had I got well acquainted with him and the Lorenskis, when two Christmas visitors arrived at their house.

They were a brother and sister, Russian nobles, known as Count Theodore and Countess Juana. Their native place was St Petersburg, but they had spent years in travelling over Europe; and though nobody

knew the extent of their estates, it was supposed to be great, for they spared no expense, and always kept the best society. Latterly they had been somehow attracted to Poland, and became so popular among our country nobles, that they were invited from house to house, making new friends wherever they went, for Russians though they were, they wished well to our country, and, among their intimates, spoke of liberty and justice with singular eloquence. Considering this, their popularity was no wonder. A handsomer or more accomplished pair I never saw. Both were tall, fair, and graceful, with hair of a light golden shade—the sister's descending almost to her feet when unbraided, and the brother's clustering in rich curls about the brow. They knew the dances of all nations, could play anything that was ever invented, whether game or instrument, and talked in every tongue of Europe, from Romaine to Swedish. Both could ride like Arabs. Count Theodore was a splendid shot, his sister was matchless in singing, and neither was ever tired of fun or frolic. They seemed of the *Lorenaskis'* years, but had seen more of the world; and though scarcely so dignified, most people preferred the frank familiarity and lively converse of the travelled Russians.

The *Lorenaskis* themselves could not but applaud that general preference. They and the travellers had become fast friends almost on their first acquaintance, which took place in the previous winter; and Count Theodore and his sister had performed a long wintry journey from St Petersburg, to celebrate the Christmas-time with them. Peasants and servants rejoiced at their coming, for they were known to be liberal. The old priest said it had never been his luck to see anything decent out of Russia before, and my uncle's entire household were delighted, with the exception of Constantine. By and by, I guessed the cause of his half-concealed displeasure. The brother of each pair took wonderfully to the sister of the other. Count Theodore talked of buying an estate in Lithuania; and the young cousins predicted, that though Emerich and Constanza might be near neighbours, they would not live all their days free and single. After the Russians' arrival, there was nothing but sport among us. We had dances and concerts, plays, and all manner of games; but the deep snow of our Polish winter had not hardened to the usual strong ice, over marsh, river, and forest-land. It continued falling day after day, shutting all our amusements within doors, and preventing, to our general regret, the wonted wolf-hunt, always kept up in Lithuania from the middle of December till Christmas-eve.

It was a custom, time immemorial, in the province, and followed as much for the amusement it afforded the young people, as for the destruction of the deadly prowler. The mode of conducting it was this: Every two or three families who chanced to be intimate when the ice was sufficiently strong and smooth for sledge-travelling, sent forth a party of young hunters, with their sisters and sweethearts, in a sledge covered at the one end, which was also well cushioned and gaily painted; the ladies in their best winter-dresses took possession of it, while the hunters occupied the exposed part, with guns, shot-pouches, and hunting-knives, in complete readiness. Beside the driver, who was generally an old experienced hand, there was placed a young hog, or a leg of pork, occasionally roasted to make the odour more inviting, and packed up with cords and straw in a pretty tight parcel, which was fastened to the sledge by a long rope twisted to almost iron hardness. Away they drove at full speed; and when fairly in the forest, the pork was thrown down, and allowed to drag after the sledge, the smell of it bringing wolves from every quarter, while the hunters fired at them as they advanced. I have seen a score of skins collected in this manner, not to speak of the fun, the excitement, and the opportunities for

exhibiting one's marksmanship and courage where one would most wish to have them seen.

The peasants said it was never lucky when Christmas came without a wolf-hunt: but that year it was like to be so; for, as I have said, the snow kept falling at intervals, with days of fog and thaw between, till the night before the vigil. In my youth, the Lithuanians kept Christmas after the fashion of old northern times. It began with great devotion, and ended in greater feasting. The eve was considered particularly sacred: many traditional ceremonies and strange beliefs hung about it, and the more pious held that no one should engage in any profane occupation, or think of going to sleep after sunset. When it came, our disappointment concerning the wolf-hunt lay heavy on many a mind as well as mine; but a strong frost had set in before daybreak, and at the early nightfall a finer prospect for sledging could not be desired—over the broad plain, and far between the forest pines, the ice stretched away as smooth and bright as a mirror. The moon was full, and the stars were out by thousands: you could have read large print by the cold, clear light, as my cousins and I stood at my uncle's door, fervently wishing it had been any other evening. Suddenly, our ears caught the sound of bells and laughing voices, and in a few minutes up drove the *Lorenski* sledge in its gayest trappings, with Constanza, the Russian countess, and the young cousins, all looking blithe and rosy in the frosty air, while Emerich and Theodore sat in true hunter's trim, and Father Cassimer himself in charge of the reins, with the well-covered pork beside him. They had two noble horses of the best Tatar blood, unequalled in the province, as we knew, for speed and strength; and Emerich's cheerful voice first saluted us with: 'Ho! friends, it is seven hours yet till midnight: won't you come with us?—it is a shame to let Christmas in without a wolf-skin!'

That was enough for us: we flew in for our equipments. My uncle was not at first willing that we should go; but the merry company now at his door, the unequivocal countenance which Father Cassimer gave to the proceeding, and the high spirits of the young Russians, who were, as usual, wild for the sport, made him think that, after all, there was no harm in the young people taking an hour or two in the woods before mass, which on Christmas-eve begins always at midnight. Our hunting-gear was donned in a trice; and with my uncle's most trusty man, *Metski*, to assist in driving, away we went at full speed to the forest.

Father Cassimer was an experienced general in expeditions of the kind; he knew the turns of the woods where the wolves scented best; and when we had got fairly among the tall oaks, down went his pork. For some time it dragged on without a single wolf appearing, though the odour came strong and savoury through cords and straw.

'If I were a wolf myself, I would come for that,' said old *Metski*. The priest quickened his speed, vowing he would not say mass without a skin that night; and we got deeper into the wilderness of oak and pine. Like most of our Lithuanian forests, it had no under-wood. There was ample space for our sledge among the great trees, and the moonlight fell in a flood of brightness upon their huge white trunks, and through the frost-covered branches. We could see the long icicles gleaming like pendants of diamond for miles through the wide woods, but never a wolf. The priest began to look disappointed; *Metski* sympathised with him, for he relished a hunt almost as well as his reverence; but all the rest, with the help of the Russians, amused themselves with making game. I have said they were in great spirits, particularly Count Theodore; indeed he was generally the gayest of the pair—his sister being evidently the more prudent—and in this respect they resembled the *Lorenaskis*. Many a jest, however, on the non-appearance of the wolves

went round our sledge, of which I remember nothing now except that we all laughed till the old wood rang.

'Be quiet, good children,' said the priest, turning in his seat of command: 'you make noise enough to frighten all the wolves in creation.'

'They won't come to-night, father; they are preparing for mass,' cried Count Theodore. 'Juana, if the old Finn were here now, wouldn't he be useful?'

'Perhaps he might,' said the countess, with a forced laugh; but she cast a look of strange warning and reproof on her brother.

'What Finn?' said the priest, catching the count's words.

'Oh, he is talking of an old nursery-tale we had in St Petersburg,' hastily interposed the lady, though I thought her face had no memory of the nursery in it.

'About the Finns I'll warrant,' said Father Cassimer. 'They are a strange people. My brother the merchant told me that he knew one of them at Abo who said he had a charm for the wolves; but somebody informed against him for smuggling, and the Russian government sent him to the lead-mines in Siberia. By Saint Sigismund, there's the first of them!'

As the priest spoke, a large wolf appeared, and half the guns in the sledge were raised. 'Not yet, not yet,' said our experienced commander, artfully turning away as another and another came in sight. 'There are more coming,' and he gradually slackened our pace; but far off through the moonlit woods and the frozen night we could hear a strange murmur, which grew and swelled on all sides to a chorus of mingled howlings, and the wolves came on by troops.

'Fire now, friends!' cried Father Cassimer. 'We are like to have skins enough for Christmas;' and bang went all our barrels. I saw five fall; but, contrary to expectation, the wolves did not retire—they stood for an instant snarling at us. The distant howlings continued and came nearer; and then from every glade and alley, down the frozen streams, and through the wide openings of the forest, came by scores and hundreds such a multitude of wolves as we could not have believed to exist in all Lithuania.

'Hand me my gun, and take the reins, Metski,' cried Father Cassimer. 'Drive for your life!' he added in an under tone; but every one in the sledge heard him. Heaven knows how many we killed; but it seemed of no use. Our pork was swallowed, straw and all. The creatures were pressing upon us on every side, as if trying to surround the sledge; and it was fearful to see the leaps that some gray old fellows among them would take at Metski and the horses. Our driver did his part like a man, making a thousand winds and turns through the woods; but still the wolves pursued us. Fortunately, the firing kept them off, and, thanks to our noble horses, they were never able to get ahead of us; but as far as we could see behind us in the moonlight, came the howling packs, as if rising from the ground of the forest. We had seen nothing like it, and all did their best in firing, especially Count Theodore; but his shots had little effect, for his hand shook, and I know not if any but myself saw the looks of terrified intelligence which he exchanged with his sister. Still, she and the Lady Constanza kept up their courage, though the young cousins were as white as snow, and our ammunition was fast decreasing.

'Yonder is a light,' said Constanza at last, as the poor horses became unmanageable from fright and weariness. 'It is from the cottage of old Wenzel, the woodman.'

'If we could reach that,' said Father Cassimer, 'and leave the horses to their fate: it is our only chance.'

No one contradicted the priest's arrangement, for his last words were felt to be true—though a pang passed over Constanza's face at the thought of leaving our brave and faithful horses to the wolves: but louder rose the howls behind us, as Metski urged on with all

his might, and far above all went the shout of Father Cassimer (he had the best lungs in that province): 'Ho, Wenzel! open the door to us for God's sake!'

We heard the old man reply, sent one well-aimed volley in among the wolves, and as they recoiled, man and woman leaped from the sledge—for our Polish girls are active—and rushed into the cottage, when old Wenzel instantly double-barred the door. It was woful to hear the cry of pain and terror from our poor horses as we deserted them; the next instant the wolves were upon them. We saw them from the window, as thick as ever flies stuck on sugar. How we fired upon them, and with what good-will old Wenzel helped us, praying all the time to every saint in the calendar, you may imagine! But still their numbers were increasing; and as a pause came in the fearful din, we plainly heard through the still air the boom of our own great bell, ringing for the midnight mass. At that sound, Father Cassimer's countenance fell for the first time. He knew the bellman was a poor half-witted fellow, who would not be sensible of his absence; and then he turned to have another shot at the wolves.

Shots were by this time getting scarce among us. There was not a man had a charge left but old Wenzel, who had supplied us as long as he could; but at length, loading his own gun with his last charge, he laid it quietly in the corner, saying one didn't know what use might be for it, and he never liked an empty gun.

Wenzel was the son of a small innkeeper at Grodno, but after his father's decease, which occurred when he was a child, his mother had married a Russian trader, who, when she died, carried the boy to Moscow. There Wenzel bade fair to be brought up a Russian; but when a stepmother came home, which took place while he was still a youth, he had returned to his native country, built himself a hut in the woods of Lithuania, and lived a lonely hunter till the time of my story, when he was still a robust, though gray-haired man. Some said his Muscovite parents had not been to his liking; some that he had found cause to shoot a master to whom they apprenticed him at Moscow; but be that as it might, Wenzel hated the Russians with all his heart, and never scrupled to say that the gun which had served him so long would serve the country too if it ever came to a rising. So much for Wenzel's story, by way of explaining what followed; but as I stood beside him that night at the hut's single crevice of a window, I could have given Poland itself for ammunition enough to do service on the wolves. They had now left nothing but the bones of our horses, which they had dragged round and round the cottage, with a din of howlings that almost drowned our voices within. Then they seized on the bodies of their own slain companions, which were devoured to the very skins; and still the gathering was going on. We could see them coming in troops through the open glades of the forest, as if aware that some human prey was in reserve. The hut was strongly built of great pine-logs, but it was fearful to hear them tearing at the door and scratching up the foundations. The bravest among us got terrified at these sounds. Metski loudly avowed his belief that the wolves were sent upon us as a punishment for hunting on Christmas-eve, and fell instantly to his prayers. Wenzel flung a blazing brand among them from the window, but they did not seem to care for fire; and three of them were so near leaping in, that he drove to the log-shutter and gave up that method of defence. None of the party appeared so far overcome with terror as Count Theodore: his spirit and prudence both seemed to forsake him. When the wolves began to scratch, he threw himself almost on his face in the corner, and kept moaning and praying in Russian, of which none of us understood a syllable but old Wenzel. Emerich and I would have spoken to him, but the woodman stopped us with a strange sign. Count Theodore had taken the relic of some

saint from a pocket-book which he carried in his breast, and was, in Russian fashion as I think, confessing his sins over it; while his sister sat silent and motionless by the fire, with livid face and clasped hands. It was burning low, but I saw the woodman's face darken. He stepped to the corner and took down his gun, as I believed, to take the last shot at the wolves; but Count Theodore was in his way. He levelled it for an instant at the prostrate man, and before I could speak or interpose, the report, followed by a faint shrill shriek from the Russian, rang through the hut. We rushed to him, but the count was dead. A bullet had gone right through the heart.

'My gun has shot the count, and the wolves will leave us now,' said Wenzel coolly. 'I heard him say in his prayers that a Finn, now in the Siberian mines, had vowed to send them on him and his company wherever he went.'

As the woodman spoke, he handed to Count Emerich, with a hoarse whisper, a bloody pocket-book, taken from the dead body, and turning to Juana, said something loud and threatening to her in the Russian tongue; at which the lady only bowed her head, seeming of all in the hut to be the least surprised or concerned at the death of her brother. As for us, the complicated horrors of the night had left us stunned and stupefied till the rapid diminution of the wolfish din, the sounds of shots and voices, and the glare of flambeaux lighting up the forest, brought most of us to the window. The wolves were scouring away in all directions, there was a grayness in the eastern sky, for Christmas-day was breaking; and from all sides the count and my uncle's tenantry, with skates and sledges, guns and torches, were pouring to the rescue as we shouted to them from the cottage.

They had searched for us almost since midnight, fearing that something terrible had detained Father Cassimer and his company from mass. There were wonderfully few wolves shot in the retreat, and we all went home to Count Emerich's house, but not in triumph, for with us went the body of the Russian, of which old Wenzel was one of the bearers. The unanimous determination we expressed to bring him to justice as a murderer, was silenced when Emerich shewed us in confidence a letter from the Russian minister, and a paper with all our names in a list of the disaffected in Upper Lithuania, which he had found in Theodore's pocket-book. After that, we all affirmed that Wenzel's gun had gone off by accident; and on the same good Christmas-day, Count Emerich, with a body of his retainers, escorted the Lady Juana to a convent at the other end of the province, the superior of which was his aunt. There she became a true Catholic, professed, and, as I was told, turned to a great saint. There is a wooden cross with his name, and a Latin inscription on it, marking Count Theodore's grave, by our old church on the edge of the forest. No one ever inquired after him, and the company of that terrible night are far scattered. My uncle and his sons all died for the poor country. The young cousins are married to German doctors in Berlin. Constanza and her brother are still single, for aught I know, but they have been exiles in America these fifteen years. Father Cassimer went with them, after being colonel of a regiment which saw hard service on the banks of the Vistula; and it may be that he is still saying mass or hunting occasionally in the Far West.

The last time I saw Wenzel and Metaki was in the trenches at Minsk, where they had a tough debate regarding our adventure in the forest: the woodman insisting it was the Finn's spell that brought the wolves in such unheard-of numbers, and the peasant maintaining that it was a judgment on our desecration of Christmas-eve. For my own part, I think the long storm and a great scarcity of food had something to do with it, for tales of the kind were never wanting in

our province. The wolf-gathering, however, saved us a journey to Siberia: thanks to old Wenzel. And sometimes yet, when any strange noise breaks in upon my sleep even here in England, I dream of being in his wild hut in the forest and listening to the wolfish voices at the door.

THE DROLLERIES OF FALSE POLITICAL ECONOMY.

PLANS FOR PAYING THE NATIONAL DEBT.

It is not customary to associate the ludicrous with financial operations—with budgets, schemes of taxation, and national debts. In general, they are considered to assume a formidable aspect; and when that is not the case, their details are looked on as dry and uninteresting—they are universally voted a 'bore.' Yet we engage to shew, that there have been some financial projects which at the present day we can pronounce essentially ludicrous. And they are not the mere projects of enthusiasts and theoretic dreamers. They were put in practice on a large scale; they involved the disposal of millions of money; and they were in operation at so late a period, that the present generation paid heavy taxes for the purpose of carrying them out—taxes paid for nothing better than the success of a practical hoax.

The round hundreds of millions in which our national debt is set forth seem to have often confused the brains of our most practical arithmeticians and financiers. They seem to have felt as if these did not represent real money, but something ideal; or perhaps we might say, they have treated them like certain results of the operation of figures which might be neutralised by others, as the equivalents on the two sides of an equation exhaust each other. We never hear of a man trying to pay his own personal debts otherwise than with money, but we have had hundreds of projects for paying the national debt without money, and generally through some curious and ingenious arithmetical process. We might perhaps amuse our readers by an account of some of these, for to their absurdity there are no bounds; but we adhere in the meantime to our engagement, to shew that on this subject even the practical projects of statesmen of our own day have been ridiculous.

We shall suppose that some one has occasion for L.100, which he finds a friend obliging enough to lend him. On receiving it, he requests the loan of other L.10; and being asked for what purpose, he answers, that with that L.10 he will pay up the original L.100. This is a rather startling proposal; but when he is asked how he is to manage this practical paradox, he says: 'Oh, I shall put out the L.10 to interest, and in the course of time it will increase until it pays off the L.100.' The lender is perhaps a little staggered at first by the audacious plausibility of the proposal, but it requires but a few seconds to enable him to say: 'Why, yea, you may lend out the L.10 at interest; but in the meantime, as you have borrowed it, interest runs against you upon it; so what better are you?' The lender, so far from concurring with the sanguine hopes about the fructification of the L.10, will only regret his having intrusted the larger sum to a person whose notions of money are so loose and preposterous.

Yet the proposal would only have carried into private pecuniary matters the principle of the sinking-fund, so long deemed a blessing, and a source of future prosperity to the country. A sinking-fund is an expression generally applied to any sum of money reserved out of expenditure to pay debt, or meet any contingency. Now, observe that our remarks are not directed against it in this simple form. A surplus of revenue obtained by moderate taxation, saved through frugal expenditure, and applied to the reduction of the national debt,

is always a good thing. But the sinking-fund to which we chiefly refer was a system of borrowing money to pay debt. It might be said that the identical money which was borrowed was not the same which was used for paying the debt; but it came to the same thing if the sinking-fund was kept up while the nation was borrowing. Thus, taking the case of the private borrower as we have already put it, if he took L.10 of his own money and put it out at interest, that it might increase and pay off his loan, and if, by so doing, he found it necessary to borrow L.110, instead of merely L.100, it was virtually the same as if he applied L.10 of the borrowed money for his sinking-fund. Thus for the year 1808, the state required L.12,200,000 in loan above what the taxes produced. But in the same year L.1,200,000 were applied to the sinking-fund; consequently, it was necessary to borrow so much more, and therefore the whole loan of that year amounted to L.13,400,000. The loan was increased exactly in the way in which our friend added the L.10 to the L.100. It was borrowing money to pay loans.

The application of millions in this manner by our statesmen, was in a great measure owing to the enthusiastic speculations of Dr Richard Price, a benevolent, ingenious, and laborious man, who, unfortunately for the public, possessed the power of giving his wild speculations a tangible and practical appearance. He was, to use a common expression, 'carried off his feet' by arithmetical calculations. He believed compound interest to be omnipotent. He made a calculation of what a penny could have come to if laid out at compound interest from the birth of Christ to the nineteenth century, and found it would make—we forget precisely how many globes of gold the size of this earth. He did not say, however, where the proper investments were to be made; how the money was to be procured; and, most serious of all, he overlooked that where one party received such an accumulating amount of money, some other party must pay it, and to pay it must make it. In fact, the doctor looked on the increase of money by compound interest as a mere arithmetical process. The world, however, finds it to be a process of working, and the making of money by toil, parsimony, and anxiety.

When any one seizes on such a theme he is sure to be carried to extremities with it. It was one of Price's favourite theories, that the time when interest was highest was the best time for borrowing money, because the borrowed sinking-fund would then bring the highest interest. One is astonished in times like these, when people think taxes and national debt so serious, at the easy carelessness with which the doctor treats the disease, and his sure remedy. He says in his celebrated work on Annuities (i. 277): 'It is an observation that deserves particular attention here, that in this plan it will be of less importance to a state what interest it is obliged to give for money; for the higher the interest, the sooner will such a sum pay off the principal. Thus, L.100,000,000 borrowed at 8 per cent., and bearing an annual interest of L.8,000,000, would be paid off by a fund producing annually L.100,000 in fifty-six years; that is, in thirty-eight years less time than if the same money had been borrowed at 4 per cent. Hence it follows that reductions of interest would in this plan be no great advantage to a state. They would indeed lighten its present burdens; but this advantage would be in some measure balanced by the addition which would be made to its future burdens, in consequence of the longer time during which it would be necessary to bear them.'

'Certain it is, therefore,' says the doctor, in a general survey of his arithmetical salvation of the country, 'that if our affairs are to be relieved, it must be by a fund increasing itself in the manner I have explained. The smallest fund of this kind is indeed omnipotent, if it is allowed time to operate.' And again: 'It might be

easily shewn that the faithful application from the beginning of the year 1700, of only L.200,000 annually, would long before 1790, notwithstanding the reductions of interest, have paid off above L.100,000,000 of the public debts. The nation might therefore some years ago have been eased of a great part of the taxes with which it is loaded. The most important relief might have been given to its trade and manufactures; and it might now have been in better circumstances than at the beginning of last war: its credit firm; respected by foreign nations, and dreaded by its enemies.'

That such a tone should be assumed by an enthusiastic speculator is not wonderful. The payment of the national debt has been one of the staple dreams of enthusiasts. It would be difficult to believe the wild nonsense that has been written on it; and Hogarth, in his dreadful picture of a madhouse, appropriately represents one of his principal figures hard at work on it. But the remarkable thing—and what shews the perilous nature of such speculations—is, that these theories were worked out by chancellors of the exchequer, and adopted by parliament. There was a faint sinking-fund so early as 1716; but Walpole one day swept it up and spent it, having probably just discovered that it was a fallacy. It was in the days of the younger Pitt, however, that it came out in full bloom. After it had been for several years in operation, a retired and absent-minded mathematical student, Robert Hamilton, shewed its falsity in a book printed in 1818. The exposure was conclusive, and no one since that time has ventured to support a sinking-fund.

As already stated, it is a very good thing to save something out of the revenue and pay off part of the debt. But no good is done by keeping it to accumulate at interest, because the debt it would pay off is just accumulating against it. Apply this to private transactions. You are in debt L.110. You have L.10, and the question is: Are you to pay it at once, and reduce your debt to L.100, or are you to keep it accumulating at interest? It is much the same which you do, only the latter is the more troublesome mode. If you pay it at once, you will just have so much less interest to hand over to your creditor. If you put it out at interest, you will have to pay over to him what you receive for it, in addition to the interest of the L.100. There is an incidental purpose for which it has been deemed right that the government should, however, have a fund at its disposal—that is for buying into the funds when they fall very low, and thus accomplishing two services—the one the paying a portion of the debt at a cheap rate, the other stopping the depreciation of the funds. This is in itself we doubt not a very just practical object, but we believe the sums that can be applied to it are very small in comparison with the reserves which formed the old sinking-fund.

But another and a very different argument has been adduced, not certainly for the re-establishment and support of a sinking-fund, since its fallacy has been exposed, but against the policy of having exposed it. It is said that the belief in the potency of a sinking-fund for clearing off the debt inspired public confidence in the stability of the funds, and that it was wrong to shake this confidence even by the promulgation of truth. It has often been supposed, indeed, that the statesmen who mainly carried out the system were in secret conscious of its fallacy, but were content to carry it out so long as they saw that it inspired confidence in the public. It is in allusion to this that we have spoken of the sinking-fund as a great hoax. We cannot sanction the morality of governments acting on conscious fallacies; and in this instance the natural confidence in the funds rather enlarged than decreased when the fallacy was exposed and the system abandoned.

Keeping in view Dr Price's views of the potentiality of compound interest, we now give a brief account of a

singular attempt made in France to put them in practice, and by their omnipotence pay our national debt and that of other nations too, out of a small private fortune. In the year 1794, a will was registered in France by one Fortuné Ricard, disposing of a sum of 500 livres, a little more than L.20 sterling. Fortuné stated that this sum was the result of a present of twenty-four livres which he had received when he was a boy, and had kept accumulating at compound interest to a period of advanced age. By his will he left it in the hands of trustees, making arrangements for a perpetual succession, as the purposes of the trust were not to be all accomplished for a period of several centuries. The money was to be divided into five portions, each of 100 livres, and so to be put out at compound interest.

The first portion was to be withdrawn at the end of a century: it would then amount to 13,000 livres, or about L.550. It is scarcely worth while mentioning the purposes to which this trifle was to be applied, but for the credit of M. Ricard it may be mentioned that they were all unexceptionable. In two centuries the second sum would be released, amounting to 1,700,000 livres. At the end of the third century, the third instalment was to be released, when it would consist of 226,000,000 livres. The destination of these magnificent sums was also unexceptionable—it was for national education, the erecting of public libraries, and the like. The instalment to be released at the end of the fourth century would amount to about 80,000,000,000 livres: it was to be employed partly in the building of 100 towns, each containing 150,000 inhabitants, in the most agreeable parts of France. 'In a short time,' says the benevolent founder, 'there will result from hence an addition of 15,000,000 of inhabitants to the kingdom, and its consumption will be doubled—for which service I hope the economists will think themselves obliged to me.' Malthus had not then published his principles of population.

We must draw breath as we approach the destination of the fifth and last instalment. It was to amount to four millions of millions of livres—about a hundred and seventy thousand millions of pounds. We take for granted that Fortuné's calculations are correct, and have certainly not taken the trouble of verifying them. Among other truly benevolent and cosmopolitan destinations of this very handsome sum, it may be sufficient to mention these:—

'Six thousand millions shall be appropriated towards paying the national debt of France, upon condition that the kings, our good lords and masters, shall be entreated to order the comptrollers-general of the finances to undergo in future an examination in arithmetic before they enter on the duties of their office.

'Twelve thousand millions shall likewise be employed in paying the public debts of England. It may be seen that I reckon that both these national debts will be doubled in this period—not that I have any doubt of the talents of certain ministers to increase them much more, but their operations in this way are opposed by an infinity of circumstances, which lead me to presume that these debts cannot be more than doubled. Besides, if they amount to a few thousands of millions more, I declare that it is my intention that they should be entirely paid off, and that a project so laudable should not remain unexecuted for a trifle more or less.'

M. Ricard, it will be observed, must have drawn his will while royalty was in the ascendant; it was registered during the Reign of Terror, and one would be curious to know how many weeks, instead of centuries, his 500 livres remained sacred. Money in the most steadily-governed states—in our own, for instance—

is subject to continual casualties. The most acute men of business cannot command perfectly certain investments for their own money—they are often miserably deceived, and suffer heavy losses. M. Ricard, however, supposed that a set of irresponsible trustees would for centuries always discover perfectly sure investments, and act with consummate watchfulness and honesty. If it were possible to leave behind one money with the qualification of always being securely invested, while the rest of the property in the world remained insecure, it would gradually suck all the wealth of the world into its vortex. But it would require supernatural agency to make it thus absolutely secure.

SIR FRANCIS HEAD'S 'FAGGOT.'*

'A FAGGOT OF FRENCH STICKS' is the whimsical title of a work just presented to the public, by the author of *Bubbles from the Brunnen of Nassau*; the said work being as respectable a specimen of bookmaking as has ever come under our notice. The object of the writer appears to have been to fill so much paper, by saying something about all he saw or heard of in a visit to Paris, no matter how insignificant the circumstances; and by this ingenious means, he has actually contrived to make up two goodly-sized volumes for the literary market.

The author of this strange melange, however, is not without a dash of merit; he possesses a terrier-like power of poking about into holes and corners, and dragging to light a variety of facts which might escape the attention of less vigilant tourists. For example, he is not satisfied with the mere sight or employment of omnibuses, street-porters, *chiffonniers*, and other agents of the public service, but must know all about them—how the omnibus horses live, and how many miles they run per diem; what variety of occupations the porters resort to for a livelihood; and what are the substances, and their value, that the *chiffonniers* scrape every morning from the kennel. Sir Francis is great on pig slaughter-houses, furnished lodgings, and police-officers. He tells you every particular of his lodging: how he ascended the stair; what landing-places there were; what price he was to pay; how the servant brought him too few pieces of butter to breakfast, and what he said in ordering more; how one day he perceived a bad smell in his sitting-room, and shifted to a higher part of the building, where the bad smell did not come; how he finally paid his account, and how the *concierge* bade him good-by. All important information this. An equally true and particular narrative is given of Sir Francis's object in visiting Paris, which was to consult an oculist on the subject of his eyes. In going to the oculist's, we are informed how he left his lodgings at a quarter before seven o'clock; how he crossed the Place Vendôme, and saw a sentinel pacing at the foot of Napoleon's Column; how he observed that the sentinel had the misfortune to have a hole in his greatcoat, which affords an opportunity too good to be lost for quoting that little-known verse of Burns's—'If there's a hole in a' your coats,' &c.; how he then, being done with looking at the sentinel, goes on his way, crosses the Boulevard des Italiens, and enters the Rue de la Chaussée d'Antin; how he looks about him till he sees No. 50, and, having spoken a word to the door-keeper, goes up stairs. Then, he informs his readers that he rang the doctor's bell; and how, the door being opened by a boy in livery, he was shewn into a drawing-room. Here, he tells us, he sat down in company with a number of other patients, waiting their turn to be called by the doctor. Vastly

* See the will at length in the appendix to Lord Lauderdale's *Inquiry into the Nature and Origin of Public Wealth*.

* *A Faggot of French Sticks*, 2 vols. London: Murray. 1862.

amusing all this, but nothing to what follows:— 'For a considerable time we all sat in mute silence, and, indeed, in our respective attitudes, almost motionless, save that every now and then a gentleman, and sometimes a lady, would arise, slowly walk diagonally across the carpet to a corner close to the window, press with his or her hand the top of a little mahogany machine that looked like an umbrella-stand, look down into it, and then very slowly, at a sort of funereal pace, walk back. All this I bore with great fortitude for some time: at last, overpowered by curiosity, I arose, walked slowly and diagonally across the carpet, pushed the thing in the corner exactly as I had seen everybody else push it, looked just as they did, downwards, where, close to the floor, I beheld open, in obedience to the push I had given from the top, the lid of a spitting-box, from which I very slowly, and without attracting the smallest observation, walked back to my chair.' Wonderful power of description this!

Having had the honour of receiving an invitation to dinner at the Elysée, Sir Francis of course goes at the appointed hour, seven o'clock. The following is his account of the affair. After passing through the entrance-hall, 'I slowly walked through two or three handsome rooms *en suite*, full of interesting pictures, into a drawing-room, in which I found assembled, in about equal proportions, about fifty very well-dressed ladies and gentlemen, the latter being principally officers, whose countenances, not less clearly than the decorations on their breasts, announced them to be persons of distinction. The long sofas and chairs, as if they had only just come out—or rather, as if they had just come up from the country to come out—had arranged themselves so very formally, and altogether behaved so very awkwardly, that it was almost impossible for the company assembled to appear as much at their ease as, from their position, education, and manners, they really were; and accordingly, biassed by the furniture, they kept moving, and bowing, and courtesying, and *sotto-voce* talking, until they got into a parallelogram, in the centre of which stood, distinguished by a broad ribbon, and by a mild, thoughtful, benevolent countenance, Prince Louis Napoleon, whose gentle and gentleman-like bearing to every person who approached him entitled him to that monarchical homage in which the majority evidently delighted, but which it was alike his policy as well as his inclination—at all events to appear—to suppress; and accordingly the parallelogram, which, generally speaking, was at the point of congelation, sometimes and of its own accord froze into the formality of a court, and then all of a sudden appeared to recollect that the Prince was the President, and that the whole party had assembled to enjoy *liberté, fraternité, et égalité*. As I was observing the various phases that one after another presented themselves to view, the principal officer of the household came up to me, and in a quiet and appropriate tone of voice, requested me to do two things; one of which appeared to me to be rather easy, and the other—or rather to do both—extremely difficult. By an inclination of his forehead he pointed to two ladies of rank, whose names he mentioned to me, but with whom I was perfectly unacquainted, seated on the sofas at different points of the parallelogram. 'When dinner is announced you will be so good,' he said, 'as to offer your arm to —' (the one) 'and to seat yourself next to —' (the other.) Of course I silently bowed assent; but while the officer who had spoken to me was giving similar instructions to other gentlemen, I own I felt a little nervous, lest, during the polite scramble in which I was about to engage, like the dog in the fable, grasping at the shadow of the second lady, I might lose the substance of the first, or *vice versa*. However, when the doors were thrown open, I very quickly, with a profound reverence, obtained my prize, and at once confiding to her—for had I deliberated I should have been lost—the

remainder of the pleasing duty it had been predestined I was to have the honour to perform, we glided through couples darting in various directions for similar objects, until, finding ourselves in a formal procession sufficiently near to the lady in question, we proceeded, at a funereal pace, towards our doom, which proved to be a most delightful one. Seated in obedience to the orders I had received, we found ourselves exactly opposite "le Prince," who had, of course, on his right and left, the two ladies of highest rank. The table was very richly ornamented, and it was quite delightful to observe at a glance what probably in mathematics, or even in philosophy, it might have been rather troublesome to explain—namely, the extraordinary difference which existed between forty or fifty ladies and gentlemen standing in a parallelogram in a drawing-room, and the very same number and the very same faces, rectilinearly seated in the very same form in a dining-room. It was the difference between sterility and fertility, between health and sickness, between joy and sorrow, between winter and summer; in fact, between countenances frozen into Lapland formality and glowing with tropical animation and delight. Everybody's mouth had apparently something kind to say to its neighbour's eyes; and the only alloy was that, as each person had two neighbours, his lips, under a sort of *embarras des richesses*, occasionally found it rather difficult to express all that was polite and pleasing to both.' Dinner being over, all returned to the drawing-room in the same formal order. Each gentleman bowed ceremoniously to the lady he had conducted, she withdrew her arm, and the sofas were again to be seen fringed by rows of satin shoes; while the carpet, in all other directions, was subjected to the pressure of boots, that often remained for a short time motionless as before. A general buzz of conversation, however, soon enlivened the room; and the President, gladly availing himself of it, mingled familiarly with the crowd.'

In the course of his rambles through Paris, Sir Francis visits various *casernes* or military barracks, and military schools. He also makes sundry investigations into the functions and *matériel* of the French army, and finally, in company with Louis Napoleon, goes to a review. The sum of these proceedings is, that he is much struck with the progress made by the French in strategy and military manœuvres, especially in their musket-ball firing, against which, he says, we have no chance. Everybody knows that our author is an alarmist, ever sighing over our want of national defences, and dreaming of invasion and rapine. At the same time, his details on military affairs are worth the notice of those to whom the business of military education is intrusted.

Sir Francis is very much pleased with the Parisian street *commissionnaires* or porters, and wonders that no such luxury is general in London. One day he invites the nearest *commissionnaire* to visit his lodging, and tell him his whole story, which the man gladly did. Setting off at a great rate, he said:— 'Sir, I black boots; I saw wood; I take it up into the apartments; I carry portmanteaus and luggage, and whatever offers itself; I carry letters and parcels; I rub the floors of apartments and stairs; I wash the floors and the dining-rooms; I change furniture from one house to another with a handbarrow—carried by two men with leathern straps; I draw a cart with portmanteaus, wood, or furniture; I beat carpets, take them up out of the apartments, and carry them to the barrier outside Paris (yes, sir); I bring them back to the persons to whom they belong; I lay them down. I know how to arrange a room; I make the beds; I colour the inlaid floors of the apartments; I watch a sick person through the night and day (a shrug) for so much a day (a shrug), and for the night also (a shrug); I agree as to the price with those persons who employ me, for five francs the night, eight francs for the

twenty-four hours, when they do not feed me; besides, I watch the dead in the apartment during the twenty-four hours that they remain exposed; in short (three shrugs), I do whatever is offered to me. I receive commercial notes for whoever will charge me with the commission, and who will give me the note to enable me to receive it; I bring back the money to the person who has intrusted me with the note, and the person pays me for my commission; I pawn at the Mont de Piété whatever the public is willing to intrust to me—jewels (a shrug), chains, watches, gold or silver; I pawn silver spoons and forks, for eating; I pawn clocks, linen; they take everything in pawn (a shrug) at the Mont de Piété—furniture, pianos, mattresses, candelabras, lustres: in short, they take in pawn everything of value; and I bring back the money and the pawnbroker's ticket to the person who has intrusted me with the commission, and at the same time that person pays me for my commission. Afterwards, I redeem pawned articles from the Mont de Piété for all those persons who choose to honour me with their commissions, provided that the person puts his signature on the back of the paper which the Mont de Piété delivered to him on the day when he pawned the aforesaid articles. I act as commissioner throughout all the departments of France, and also (shrug) in foreign countries, according to the price agreed on, and at a reasonable price; I travel on the railways (shrug), in the diligence (shrug); I go as quick as I can, and I come back as quick as I can; I rub down a horse—I can! I feed him; wash the carriage; drive the carriage; arrange the cellar; rinse out the bottles; bottle the wine; pile up the bottles after they are corked and stamped; lower the hogsheads of wine into the cellar with a thick rope, with the help of a comrade, and the price is two francs for each hogshead. In my own country, I am a labourer, and do everything relating to the cultivation of the ground. I root up the trees; I saw them into several lengths; I split the wood; pile it up to dry; then load it on mules, and carry it to the house to be burned; afterwards I mow the hay and corn; carry the corn into the barn (shrug), and the hay also; thrash the corn, and put it away into the granary; from whence they take it out by little and little to have it ground and to make bread. I prune the vines.' Here the commissaire gives an account of the whole process of wine-making, in which he is an adept; and then goes on to explain how he is employed as a spy on families and others, all in the way of business. He ends with saying that trade is dull, and blames the revolution of 1848 for ruining his employment—for why? 'Everybody is afraid of the future. Everybody is economical; everybody is hiding, hoarding, or saving his money, because he knows that affairs cannot continue as they are, that sooner or later there will be another revolution.' Such a country! The revolution thus anticipated has taken place. By relieving the Parisians from the fears of a social upbreak—a universal sack of property—for that was preying on their minds—the grand *coup* of Louis Napoleon will doubtless set money afloat, and restore occupation to the humbler classes—the real sufferers by revolutions.

The curious thing about all the revolutions and coups that have ever taken place in France is, that they never give the slightest particle of real liberty to the people; and, what is equally surprising, the people do not know what liberty is. It is a thing they talk about, and paint over doorways, but further they go not. When, in 1848, a mob was suffered to assume supreme authority, it might have been anticipated that the very first thing they would do would be to turn the whole police system about its business and destroy its records. No such thing. The triumphant insurrectionists, complaining of tyranny, were as tyrannical as anybody; they retained the obnoxious system of passports, and kept up the

usual routine of police administration, spies and all. The truth appears to be, that the French cannot comprehend the idea of social organisation without a minute machinery of management and interference. Society in England, where people may speak and do pretty much what they like, go here and go there without leave asked, and set up any business anywhere as suits their fancy—is anarchy, a chaos, according to French notions. Sir Francis inclines to the belief that a system of government interference and regulation, as in France, is an advantage, because it protects society against some gross abuses—such as the indiscriminate sale of medicines, want of sanitary arrangements, the open spectacle of vice, and so forth. True this, in some respects, and we could wish for a little more vigour in certain departments of our social policy; but in this, as in many things, we have to make a choice of evils. Better, we think, allow abuses to be corrected by the comparatively sluggish action of public opinion, than accustom a people to have everything done for them, every action regulated by laws and prefects of police. The account given by Sir Francis of the manner in which the authority of the police bears on common workmen, is only a version of what every traveller speaks of with execration. Although we ourselves alluded to the subject on a former occasion, we may recapitulate a few points from the volume before us: 'Every workman or labouring boy is obliged, all over France, to provide himself with a book termed *un livret*, indorsed in Paris by a commissaire of police, and in other towns by the mayor or his assistants, containing his description, name, age, birthplace, profession, and the name of the master by whom he is employed. In fact, no person, under a heavy fine, can employ a workman unless he produce a *livret* of the above description, bearing an acquittal of his engagements with his last master. Every workman, after inscribing in his *livret* the day and terms of his engagement with a new master, is obliged to leave it in the hands of his said master, who is required, under a penalty, to restore it to him on the fulfilment of his engagement. Any workman, although he may produce a regular passport, found travelling without his book, is considered as "vagabond," and as such may be arrested and punished with from three to six months' imprisonment, and after that subjected to the surveillance of the *haute-police* for at least five and not exceeding ten years. No new *livret* can be indorsed until its owner produces the old one filled up. In case of a workman losing his *livret*, he may, on the presentation of his passport, obtain provisional permission to work, but without authority to move to any other place until he can satisfy the officer of police that he is free from all engagements to his last master. Every workman coming to Paris with a passport is required, within three days of his arrival, to appear at the prefecture of police with his *livret*, in order that it may be indorsed. In like manner, any labourer leaving Paris with a passport must obtain the *visé* of the police to his *livret*, which, in fact, contains an abstract history of his industrial life. As a description of the political department of the police of Paris would involve details, the ramifications of which would almost be endless, I will only briefly state, that from the masters of every furnished hotel and lodging-house—who are required to insert in a register, indorsed by a commissaire de police, the name, surname, profession, and usual domicile of every person who sleeps in their house for a single night—and from innumerable other sources, information is readily obtained concerning every person, and especially every stranger, residing in the metropolis. For instance, at the entrance of each lodging, and of almost every private house, there sits a being termed a *concierge*, who knows the hour at which each inmate enters and goes out; who calls on him; how many letters he receives; by their post-marks, where

they come from; what parcels are left for him; what they appear to contain, &c. &c. &c. Again, at the corner of every principal street, there is located, wearing the badge of the police, a commissionaire, acquainted with all that outwardly goes on within the radius of his Argus-eyed observations. From these people, from the drivers of flacres, from the sellers of vegetables, from fruiterers, and lastly, from the masters of wine-shops, who either from people sober, tipsy, or drunk, are in the habit of hearing an infinity of garrulous details, the police are enabled to track the conduct of almost any one, and, if necessary, to follow up their suspicions by their own agents in disguises which, practically speaking, render them invisible. Sir Francis mentions that he was considered of sufficient importance to be under surveillance. "You are," said very gravely to me a gentleman in Paris of high station, on whom I had had occasion to call, "a person of some consideration. Your object here is not understood, and you are therefore under the surveillance of the police." I asked him what that meant. "Wherever you go," he replied, "you are followed by an agent of police. When one is tired, he hands you over to another. Whatever you do, is known to them; and at this moment there is one waiting in the street until you leave me."

We need say no more. The people who, under all phases of government—despotism, constitutional monarchy, and universal-suffrage republic—coolly tolerate, nay, they admire and vindicate, this atrocious system of personal restraint and espionage, are totally unfit for the enjoyment of civil liberty. In conclusion, we can hardly recommend the book before us, further than to say, that its gossip, though often prosy to the verge of twaddle, is also sometimes droll and amusing from its graphic minuteness.

IVORY AND ITS APPLICATIONS.

THE Chinese, from time immemorial, have been celebrated for their excellence in the fabrication of ornamental articles in ivory; and, strange to say, up to our own time, their productions are still unrivalled. European artists have never succeeded in cutting ivory after the manner of these people, nor, to all appearance, is it likely they ever will. Nothing can be more exquisitely beautiful than the delicate lacework of a Chinese fan, or the elaborate carving of their miniature junks, chess-pieces, and concentric balls: their models of temples, pagodas, and other pieces of architecture are likewise skilfully constructed; and yet three thousand years ago such monuments of art were executed with the very same grace and fidelity!

Ivory was known to the Egyptians as an article both of use and ornament. They manufactured it into combs, rings, and a variety of similar things. The processions on the walls of their palaces and tombs would seem to indicate the fact of its having been obtained from India, and also from Ethiopia or Central Africa. There is every reason to believe also that the harder and more accessible ivory of the hippopotamus was extensively used by them. Colonel Hamilton Smith has seen a specimen of what appeared to be a sword-handle of ancient Egyptian workmanship, which has been recognised by dentists as belonging to this class of ivory.

Ivory was extensively used by the Jews. It is frequently spoken of in Scripture as being obtained from Tarshish—an indiscriminate term for various places in the lands of the Gentiles, but probably referring in this case to some part of India or Eastern Africa. Wardrobes were made of ivory, or at least inlaid with

it; the splendid throne of Solomon was formed of this material, overlaid with gold; Ahab built an ivory palace; and beds or couches of the same material were common among the wealthy Israelites. The Phœnicians of Tyre—those merchant-princes of antiquity—were so profuse of this valuable article of their luxurious commerce as to provide ivory benches for the rowers of their galleys. Assyria—whose records and history are only now beginning to be unfolded—possessed magnificent articles of ivory. Mr Layard, in his excavations at Nineveh, found 'in the rubbish near the bottom of a chamber, several ivory ornaments upon which were traces of gilding: among them was the figure of a man in long robes, carrying in one hand the Egyptian *crux ansata*—part of a crouching sphinx—and flowers designed with great taste and elegance.'

The Greeks—who were acquainted with it at least as early as the time of Homer—gradually introduced ivory as a material for sculpture. In certain forms of combination with gold, it gave origin to the art of *chryselephantine* sculpture, so called from the Greek primitives, gold and ivory. This art, which was perhaps more luxurious than tasteful, was introduced about six hundred years before the Christian era; and it was much admired for its singular beauty. It was not, however, till the days of Phidias that it attained to its full splendour. Two of the masterpieces of this sculptor—the colossal statues of Minerva in the Parthenon at Athens and the Olympian Jove in his temple—were formed of gold and ivory. The Minerva was forty feet high, and the Olympian Jupiter was one of the wonders of the world. In the latter of these, the exposed parts of the figure were of ivory, and the drapery of gold. It was seated on a throne elaborately formed of gold, ivory, and cedar-wood; it was adorned with precious stones; and in his hand the god sustained an emblematic figure of Victory, made of the same costly materials.

The Romans used ivory as a symbol of power; but they applied it practically to an infinite variety of purposes. Their kings and magistrates sat on ivory thrones of rich and elaborate construction—an idea received from the Etruscans. The curule chairs of ivory and gold that belonged to the office of consul, together with the sceptres and other articles of similar description, were all of Etruscan origin. The *libri elephantis* were tablets of ivory, on which were registered the transactions of the senate and magistrates; the births, marriages, and deaths of the people; their rank, class, and occupation, with other things pertaining to the census. The Romans also applied this material to the manufacture of musical instruments, combs, couches, harnesses of horses, sword-hilts, girdles. They were acquainted with the arts of dyeing and incrusting ivory, and they also possessed some splendid specimens of chryselephantine statuary. Ancient writers, indeed, mention no fewer than one hundred statues of gold and ivory; but they furnish us with no particulars of the mode of executing these colossal monuments of art in a substance which could only be obtained in small pieces. A head, smaller than the usual size, a statue about eight inches in height, and a bas-relief, are the only specimens that exist in the present day.

After the fall of the Roman Empire, the taste for ivory ornament became almost extinct. There were some periods, however, in the early part of mediæval history when this material was not forgotten: when the caliphs of the East formed of it some of the beautiful ornaments of their palaces; when the Arabian alchemists subjected it to the crucible, and so produced the pigment ivory black; when a Danish knight killed an elephant in the holy wars, and estab-

lished an order of knighthood which still exists; when Charlemagne, the emperor of the West, had ivory ornaments of rare and curious carving.* It is, however, at a period subsequent to the return of the crusaders that we must date the commencement of a general revival of the taste in Europe. It would be interesting to trace the steps by which ivory regained its place in the arts and commerce of nations; but on this point we must not linger. From the low countries it spread to the far North. Its relations with art and beauty soon became widely recognised; the growing luxury of the Roman pontificate encouraged its applications; and towards the end of the fifteenth century it was extensively employed as an article of ornament and decoration in every country and court of Europe. The Portuguese were the first to revive a traffic with Africa which had been dormant for upwards of 1000 years. It was originally confined to the immense stores of ivory which the natives had accumulated for the purposes of their superstition; but these soon became exhausted, and the inexorable demands of European commerce once more prompted the destruction of the mighty and docile inhabitant of the wilderness. Elephant-hunting became a trade; and a terrible havoc was commenced, which has been unremittingly pursued down to the present time.

The term ivory, originally derived from a Greek word signifying heavy, is indiscriminately applied to the following varieties of osseous matter:—

1. *The tusks and teeth of the elephant.*—Naturalists recognise two species of elephants—the Asiatic (*Elephas Indicus*) and the African (*Elephas Africanus*). The former of these species is indigenous to the whole of Southern India and the Eastern Archipelago; but the largest and most valuable Indian elephant is that of Ceylon. The second species is found throughout the whole of Africa; and on the banks of the great rivers and lakes of the unexplored regions of the interior, herds of the finest African elephants are supposed to wander in security. It was until very recently believed that the Asiatic elephant yielded the largest teeth, and those imported from Pegu, Cochin-China, and Ceylon, sometimes weighed 150 lbs. Specimens, however, have been obtained from the interior of Africa of much greater weight and dimensions. Mr Gordon Cumming has in his collection a pair of teeth taken from an old bull elephant in the vicinity of the equator, of which the larger of the two measures 10 feet 9 inches long, and weighs 173 lbs.; and Mr Cawood, who resided thirty years at the Cape, has another pair in his possession measuring 8½ feet each, and weighing together 330 lbs.

Besides these contemporary races of elephants, the market is extensively supplied by the fossil ivory derived from the tusks of the great mammoth or fossil elephant of the geologist. The remains of this gigantic animal are abundantly distributed over the whole extent of the globe. They exist in large masses in the northern hemisphere, deeply embedded in the alluvial deposits of the tertiary period. Humboldt discovered specimens on some of the most elevated ridges of the Andes; and similar remains have been found in Africa. In the frozen regions of the far North, surrounded by successive layers of everlasting ice, the fossil ivory exists in a state of perfect preservation, and it constitutes indeed an important article of commerce in the north of Europe.

2. *The teeth of the hippopotamus, or river-horse.*—These, under the inappropriate term of 'sea-horse teeth,' supply the most suitable ivory for the dentist. In addition to twenty grinders, the animal has twelve front teeth, the outer on each side of the jaw being the largest and most prized. This ivory is much

harder, closer in the grain, and more valuable than that of the elephant. It is remarkable, moreover, for the extreme hardness of its enamel, which is quite incapable of being cut, and will strike fire with a steel instrument. The large teeth of the hippopotamus weigh on the average 6 lbs., and the small ones about 1 lb. each. Their value ranges from 6s. to 40s. per lb.

3. *The teeth of the walrus, or sea-cow.*—These are nearly straight, and measure from 2 feet to 2½ feet in length. The exterior portion of the tooth possesses a much finer grain and texture than its core, which in appearance and properties bears a close resemblance to ordinary bone. Of a yellowish cream-colour and mottled, this ivory is much less valuable than the teeth of the hippopotamus. It is seldom applied in our day to other than dental purposes; but its antiquity is interesting. The Scandinavian relics of the eleventh and twelfth centuries, with which our museums are so profusely enriched, are for the most part formed of the teeth of the walrus. The elegant spiral horn of the narwhal or sea-unicorn also produces ivory of a superior quality. It is not to any great extent applied to useful purposes, but is more frequently preserved in museums and collections as a beautiful natural curiosity.

The tusks and teeth of the elephant—the latter, for the sake of distinction, are termed grinders—are formed after the ordinary manner of the teeth of animals. The organism which converts the earthy constituents of the blood into cellular tissue and membrane, contributes in the same way to form the teeth by the successive deposition of layer upon layer of the soft vascular pulp. The marks of these depositions, or laminae, are clearly distinguishable in the longitudinal strise of the section of a tooth. Mr Corse Scott states that the Indian elephant has only ten or twelve laminae in the tooth, while that of the great mammoth has twenty-four, besides having a much more regularly disposed enamel. The tooth is hollow about half-way up, but a very small tubular cavity is visible throughout its entire length. This, sometimes called the nerve, is in reality the apex of successive formations in the process of growth. The grinders are seldom used in the arts. They are of a different texture, the laminae more loosely combined, and possessing a tendency to separate, which renders them unfit for nearly all useful purposes. Ivory has the same chemical constitution as ordinary teeth—that is, cartilage united to such earthy ingredients as the phosphate of lime.

But it is very remarkable that the fossil ivory of the mammoth, and specimens of the historic period of Pompeii or Egypt, contain sometimes as much as 10 per cent. more of fluoride of calcium than the ivory of the present day. We apprehend, however, that this property—first investigated by Dr George Wilson—may be derived from long-continued contact with earth, since fluoride of calcium is the chief ingredient in the enamel or exterior portion of the tooth. Ancient ivory, having thus gained in its inorganic bases, becomes deficient in the gelatinous constituents necessary to its preservation. We recently had a singularly beautiful application of the knowledge of this principle in the case of the ivory specimens sent from Nineveh by Mr Layard. On their arrival in England, it was discovered that they were rapidly crumbling to pieces. Professor Owen recommended that the articles should be boiled in a solution of albumen, which was done accordingly, and the ivory rendered as firm and solid as when it was first entombed.

We may allude here to a very singular physical property which is possessed by the elephant's tusk. Specimens have frequently been obtained which were found to contain musket-bullets in their centre, surrounded with a species of osseous pulp differing from the ordinary character and constitution of ivory.

* In the sacristy of the cathedral at Aix-la-Chapelle is still preserved, among other relics of this great prince, an immense ivory hunting-horn; and Charlemagne's chess-men, which still exist, form part of the collection of works of art at Cologne.

There was frequently no corresponding orifice on the surface of the tusk; and hence Blumenbach, and other naturalists, were led to form some very inaccurate notions regarding this circumstance. Mr Rodgers of Sheffield some years ago forwarded a variety of such specimens to the Edinburgh College Museum, and these were very closely examined by Professor Goodsir, who, in a communication to the Royal Society of Edinburgh, demonstrated that this arose simply from a property of isolating foreign substances common to all osseous organised bodies: the ball having been enclosed by the tusk in its pulpy secretion, and corrosive action thereby prevented, the process of growth continued without interruption.

Ivory is a solid, white, translucent substance, distinguishable from bone by its beautiful texture of semi-transparent rhomboidal network. The finest ivory is much more transparent than paper of the same thickness. A thin transverse section placed under the microscope exhibits a series of curvilinear lines diverging from the centre and interlacing each other with great regularity and beauty, closely resembling in appearance the engine-turning of a watch. It possesses a specific gravity varying from 1.888 in the tooth of the walrus, to 2.843 in that of the elephant. Its mean gravity is therefore about two and a half times greater than water. The best, finest, and most valuable ivory is that obtained from the African elephant. When recently cut, it exhibits something of a yellowish transparent tint, which is due to the oil it contains, but this gradually changes to a beautiful and permanent white. It is not easily stained or destroyed by exposure to the atmosphere, and on that account is used in the arts for all the higher purposes, and especially for carved ornaments—such as chess-pieces, crucifixes, and articles of *virtu*. Indian ivory, on the contrary, when first cut, is perfectly white, but it becomes yellow and discoloured with age and exposure. A good illustration of this circumstance is presented by the dingy-coloured keys of an old pianoforte.

This popular definition of good and inferior ivory is however, in point of fact, somewhat incorrect, since ivory obtained from the coast of Africa is often much inferior to that obtained from the Indian Archipelago. The best rule for determining the quality is probably that of its vicinity to the equator. The ivory brought from within the 10th degrees of north and south latitude is incomparably the finest in the market; it is at the same time the most transparent, which of itself is a valuable characteristic. Our Indian ivory for some years back, instead of being shipped by way of the Cape for England, has, in order to save time, been sent by the Red Sea to Suez, and thence conveyed, generally on the backs of camels, across the Desert to Alexandria, where it is again shipped on board the Oriental steam-packets for Southampton, and conveyed by railway to London. By this expeditious mode of transit, however, the value of the ivory is frequently much deteriorated. The damage it sustains in being so often loaded and unloaded; and the intense heat of a tropical sun to which it is openly exposed in crossing the Isthmus—render the tusks unsound at the core, numerous cracks and fissures appear over the surface, the points are frequently broken off, and on the whole its market-price is considerably depreciated.

There is no means of accurately determining the intrinsic value of our importation of ivory—the price is so variable. In 1827, upwards of 8000 cwt.; in 1842, upwards of 5000 cwt.; and in 1850, about 8000 cwt. was imported, of which about four-fifths was entered for home consumption. In point of quantity or bulk it is not calculated to attract attention, nor does the commercial transaction excite much notice. A quiet advertisement in the front page of the *Economist*, a few letters from London,

Birmingham, and Sheffield to City brokers—for the ivory-trade is confined to a very small number of houses—and a cargo of African or Indian ivory, amounting perhaps to L.50,000 sterling, is quickly and easily disposed of. The supply at this moment is unequal to the demand, and the price is steadily advancing.

Small teeth weighing from 4 to 20 lbs. are worth from L.10 to L.16 per cwt.; and the price of the enormous tusks we have referred to, which are far beyond the limits of the above scale, is probably equal to L.50 per cwt. or upwards. African ivory is worth about 25 per cent. more than Indian ivory of corresponding size and quality.

To attempt even to catalogue the extremely diversified uses to which ivory is applied would of itself be no easy task. There is not perhaps in the whole commercial list an article possessed of wider relations. It is extensively consumed in the manufacture of handles to knives and forks, and cutlery of every description; combs of all kinds; brushes of every form and use; billiard-balls, chess-men, dice, dice-boxes; bracelets, necklaces, rings, brooches; slabs for miniature portraits, pocket-tablets, card-cases; paper-knives, shoeing-horns, large spoons and forks for salad; ornamental work-boxes, jewel-caskets, small inlaid tables; furniture for doors and cabinets; pianoforte and organ keys; stethoscopes, lancet-cases, and surgical instruments; microscopes, lorgnettes, and philosophical instruments; thermometer scales, hydrometer scales, and mathematical instruments; snuff-boxes, cigar-cases, pipe-tubes; fans, flowers, fancy boxes; crucifixes, crosiers, and symbols of faith; idols, gods, and symbols of superstition; vases, urns, sarcophagi, and emblems of the dead; temples, pagodas; thrones, emblems of mythology; and, in short, there is hardly a purpose in the useful and ornamental arts to which ivory is, or has not been in some way extensively employed. At present, the ivory carvings of Dieppe are the finest in Europe; but the genius of the present age is utilitarian, and so are its applications of ivory. If we desire high art in the fabrication of this material, we must go back a few centuries, or be satisfied with the beautiful productions of China or Hindostan. We could scarcely give a more apt illustration of this truth than by pointing to the seat of honour set apart for Prince Albert in the closing scene of the Great Exhibition. Elevated on the crimson platform, and standing forth as an appropriate emblem of the artistic genius of the mighty collection, was observed the magnificent ivory throne presented to her Majesty by the Rajah of Travancore!

From the great value of the material, the economical cutting of it up is of the last importance. Nothing is lost. The smallest fragments are of some value, have certain uses, and bear a corresponding price. Ivory dust, which is produced in large quantities, is a most valuable gelatine, and as such extensively employed by straw-hat makers. The greatest consumption of ivory is undoubtedly in connection with the cutlery trade. For these purposes alone about 200 tons are annually used in Sheffield and Birmingham, and the ivory in nearly every instance is from India. The mode of manufacturing knife-handles is very simple and expeditious:—The teeth are first cut into slabs of the requisite thickness—then to the proper cross dimensions, by means of circular saws of different shapes. They are afterwards drilled with great accuracy by a machine; rivetted to the blade; and finally smoothed and polished. We believe that this branch of industry alone gives employment to about 500 persons in Sheffield. Combs are seldom made of any ivory but Indian, and their mode of manufacture we had recently occasion to describe.* A large

* See an article on the Aberdeen Combworks, No. 306.

amount of ivory is consumed in the backs of hair-brushes; and this branch of the trade has recently undergone considerable improvements. The old method of making a tooth-brush, for example, was to lace the bristles through the ivory, and then to glue, or otherwise fasten, an outside slab to the brush for the purpose of concealing the holes and wire-thread. This mode of manufacture has been improved on by a method of working the hair into the solid ivory; and brushes of this description are now the best in the market. Their chief excellence consists in their preserving their original white colour to the last, which is a great desideratum. Billiard-balls constitute another considerable item of ivory consumption. They cost from 6s. to 12s. each; and the nicety of our ornamental turning produces balls not only of the most perfect spherical form, but accurately corresponding in size and weight even to a single grain.

The ivory miniature tablets so much in use, and which are so invaluable to the artist from the exquisitely delicate texture of the material, are now produced by means of a very beautiful and highly interesting chemical process. Phosphoric acid of the usual specific gravity renders ivory soft and nearly plastic. The plates are cut from the circumference of the tusk, somewhat after the manner of paring a cucumber, and then softened by means of the acid. When washed with water, pressed, and dried, the ivory regains its former consistency, and even its microscopic structure is not affected by the process. Plates thirty inches square have been formed in this way, and a great reduction in price has thus been effected. Painting on ivory, we may add, was practised among the ancients.

Mr McCulloch and other statistical writers predict the speedy extinction of the elephant, from the enormous consumption of its teeth; and curious calculations of the number of these animals annually extirpated to supply the English market alone are now getting somewhat popular. For example: 'in 1827 the custom-duty on ivory (20s. per cwt.—since reduced to 1s.) amounted to L.3257. The average weight of the elephant's tusk is 60 lbs.; and therefore 3040 elephants have been killed to supply this quantity of ivory.' But these calculations are in many respects quite fallacious. In the first place, the average weight of our imported tusks is *not* 60 lbs.: we have the authority of one of the first ivory-merchants in London for stating that 20 lbs. will be a much closer approximation. This at once involves a threefold ratio of destruction. In place of 3040, we should have the terrible slaughter of 9120 elephants for one year's consumption of ivory in England! This, however, is not the case. In these calculations the immense masses of fossil ivory we have alluded to are obviously overlooked, and the equally immense quantities of broken teeth which are disinterred from the deserts of Arabia, or the jungles of Central Africa. The truth is, we have good reason to know, that a very large proportion of the commercial supply of Europe is sustained from the almost inexhaustible store of these descriptions of ivory.

Nevertheless, it is indisputable that the insatiable demands of modern commerce will inevitably lead to the ultimate extermination of this noble animal. His venerable career is ignominiously brought to an end merely for the sake of the two teeth he carries in his mouth; which are very likely destined to be cut into rings to assist the infant Anglo-Saxons in cutting their teeth, or partly made into jelly to satisfy the tastes and appetites of a London alderman. We cannot reasonably hope for a new suspension of the traffic: indeed we can only look for its extension. The luxurious tastes of man are inimical to the existence of the elephant. From time immemorial, the war of extermination has existed. His rightful domain—in

the plain or the wilderness, or amid the wild herbage of his native savannas—is at all points ruthlessly invaded. But the result is inevitable—it will come to an end; and some future generation of naturalists—those of them at least who are curious in Palæontology—will regard the remains of our contemporary races of elephants with the same kind of astonishment with which we investigate the pre-historic evidences of the gigantic tapir or the mammoth.

BLIGHTED FLOWERS.

THE facts of the following brief narrative, which are very few and of but melancholy interest, became known to me in the precise order in which they are laid before the reader. They were forced upon my observation rather than sought out by me; and they present, to my mind at least, a touching picture of the bitter conflict industrious poverty is sometimes called upon to wage with 'the thousand natural shocks which flesh is heir to.'

It must be now eight or nine years since, in traversing a certain street, which runs for nearly half a mile in a direct line southward, I first encountered Ellen—. She was then a fair young girl of seventeen, rather above the middle size, and with a queen-like air and gait which made her appear taller than she really was. Her countenance, pale but healthy, and of a perfectly regular and classic mould, was charming to look upon from its undefinable expression of loveliness and sweet temper. Her tiny feet tripped noiselessly along the pavement, and a glance from her black eye sometimes met mine like a ray of light, as, punctually at twenty minutes to nine, we passed each other near—House, each of us on our way to the theatre of our daily operations. She was an embroideress, as I soon discovered from a small stretching-frame, containing some unfinished work, which she occasionally carried in her hand. She set me a worthy example of punctuality, and I could any day have told the time to a minute without looking at my watch, by marking the spot where we passed each other. I learned to look for her regularly, and before I knew her name, had given her that of 'Minerva,' in acknowledgment of her efficiency as a mentor.

A year after the commencement of our acquaintance, which never ripened into speech, happening to set out from home one morning a quarter of an hour before my usual time, I made the pleasing discovery that my juvenile Minerva had a younger sister, if possible still more beautiful than herself. The pair were taking an affectionate leave of each other at the crossing of the New Road, and the silver accents of the younger as, kissing her sister, she laughed out, 'Good-by, Ellen,' gave me the first information of the real name of my pretty mentor. The little Mary—for so was the younger called, who could not be more than eleven years of age—was a slender, frolicsome sylph, with a skin of the purest carnation, and a face like that of Sir Joshua's seraph in the National Gallery, but with larger orbs and longer lashes shading them. As she danced and leaped before me on her way home again, I could not but admire the natural ease and grace of every motion, nor fail to comprehend and sympathise with the anxious looks of the sisters' only parent, their widowed mother, who stood watching the return of the younger darling at the door of a very humble two-storey dwelling, in the vicinity of the New River Head.

Nearly two years passed away, during which, with the exception of Sundays and holidays, every recurring morning brought me the grateful though momentary vision of one or both of the charming sisters. Then came an additional pleasure—I met them both together every day. The younger had commenced practising the same delicate and ingenious craft of embroidery, and the two pursued their industry in company under the same employer. It was amusing to mark the demure assumption of womanhood darkening the brows of the ærial little sprite, as, with all the new-born consequence of responsibility, she walked soberly by her sister's side, frame in hand, and occasionally revealed to passers-by a brief glimpse of her many-coloured handiwork. They were the very picture of beauty and happiness, and happy beyond question must their innocent lives have been for many pleasant months. But soon the shadows of care began to steal over their hitherto joyous faces, and traces of anxiety, perhaps of tears, to be too plainly visible on their paling cheeks. All at once I missed them in my morning's walk, and for several days—it might be weeks—saw nothing of them. I was at length startled from my forgetfulness of their very existence by the sudden apparition of both one Monday morning clad in the deepest mourning. I saw the truth at once: the mother, who, I had remarked, was prematurely old and feeble, was gone, and the two orphan children were left to battle it with the world. My conjecture was the truth, as a neighbour of whom I made some inquiries on the subject was not slow to inform me. 'Ah, sir,' said the good woman, 'poor Mrs D—have had a hard time of it, and she born an' bred a gentlewoman.'

I asked her if the daughters were provided for.

'Indeed, sir,' continued my informant, 'I'm afraid not. 'Twas the most unfortunatest thing in the world, sir, poor Mr D—'s dying jest as a' did. You see, sir, he war a soldier, a fightin' out in Ind'y, and his poor wife lef at home wi' them two blossoms o' gals. He warn't what you call a common soldier, sir, but some kind o' officer like; an' in some great battle fought seven year ago he done fine service I've heerd, and promotion was send out to 'un, but didn't get there till the poor man was dead of his wounds. The news of he's death cut up his poor wife complete, and she han't been herself since. I've know'd she wasn't long for here ever since it come. Wust of all, it seems that because the poor man was dead the very day the promotion reached 'un, a' didn't die a captain after all, and so the poor widdier didn't get no pension. How they've a' managed to live is more than I can tell. The oldest gal is very clever, they say; but Lor' bless 'ee! 'taint much to sport three as is to be got out o' broderin'.'

Thus enlightened on the subject of their private history, it was with very different feelings I afterwards regarded these unfortunate children. Bereft of both parents, and cast upon a world with the ways of which they were utterly unacquainted, and in which they might be doomed to the most painful struggles even to procure a bare subsistence, one treasure was yet left them—it was the treasure of each other's love. So far as the depth of this feeling could be estimated from the looks and actions of both, it was all in all to each. But the sacred bond that bound them was destined to be rudely rent asunder. The cold winds of autumn began to visit too roughly the fair pale face of the younger girl, and the unmistakable indications of consumption made their appearance: the harassing cough, the hectic cheek, the deep-settled pain in the side, the failing breath. Against these dread fore-runners it was vain long to contend; and the poor child had to remain at home in her solitary sick-chamber, while the loving sister toiled harder than ever to provide, if possible, the means of comfort and restoration to health. All the world knows the ending

of such a hopeless strife as this. It is sometimes the will of Heaven that the path of virtue, like that of glory, leads but to the grave. So it was in the present instance: the blossom of this fair young life withered away, and the grass-fringed lips of the child's early tomb closed over the lifeless relics ere spring had dawned upon the year.

Sorrow had graven legible traces upon the brow of my hapless mentor when I saw her again. How different now was the vision that greeted my daily sight from that of former years! The want that admits not of idle wailing compelled her still to pursue her daily course of labour, and she pursued it with the same constancy and punctuality as she had ever done. But the exquisitely chiselled face, the majestic gait, the elastic step—the beauty and glory of youth, unshaken because unassaulted by death and sorrow—where were they? Alas! all the bewitching charms of her former being had gone down into the grave of her mother and sister; and she, their support and idol, seemed no more now than she really was—a wayworn, solitary, and isolated struggler for daily bread.

Were this a fiction that I am writing, it would be an easy matter to deal out a measure of poetical justice, and to recompense poor Ellen for all her industry, self-denial, and suffering in the arms of a husband, who should possess as many and great virtues as herself, and an ample fortune to boot. I wish with all my heart that it were a fiction, and that Providence had never furnished me with such a seeming anomaly to add to the list of my desultory chronicles. But I am telling a true story of a life. Ellen found no mate. No mate, did I say? Yes, one: the same grim yoke-fellow whose delight it is 'to gather roses in the spring' paid ghastly court to her faded charms, and won her—who shall say an unwilling bride? I could see his gradual but deadly advances in my daily walks: the same indications that gave warning of the sister's fate admonished me that she also was on her way to the tomb, and that the place that had known her would soon know her no more. She grew day by day more feeble; and one morning I found her seated on the step of a door, unable to proceed. After that she disappeared from my view; and though I never saw her again at the old spot, I have seldom passed that spot since, though for many years following the same route, without recognising again in my mind's eye the graceful form and angel aspect of Ellen D—.

'And is this the end of your mournful history?' some querulous reader demands. Not quite. There is a soul of good in things evil. Compassion dwells with the depths of misery; and in the valley of the shadow of death dove-eyed Charity walks with shining wings. . . . It was nearly two months after I had lost sight of poor Ellen, that during one of my dinner-hour perambulations about town, I looked in almost accidentally upon my old friend and chum, Jack W—. Jack keeps a perfumer's shop not a hundred miles from Gray's Inn, where, ensconced up to his eyes in delicate odours, he passes his leisure hours—the hours when commerce flags, and people have more pressing affairs to attend to than the delectation of their nostrils—in the enthusiastic study of art and *virtu*. His shop is hardly more crammed with bottles and attar, soap, scents, and all the *etceteras* of the toilet, than the rest of his house with prints, pictures, carvings, and curiosities of every sort. Jack and I went to school together, and sowed our slender crop of wild oats together; and, indeed, in some sort have been together ever since. We both have our own collections of rarities, such as they are, and each criticises the other's new purchases. On the present occasion there was a new Van Somebody's old painting awaiting my judgment; and no sooner did my shadow darken his door, than starting from his lair, and bidding

the boy ring the bell should he be wanted, he hustled me up stairs, calling by the way to his housekeeper, Mrs Jones—Jack is a bachelor—to bring up coffee for two. I was prepared to pronounce my dictum on his newly-acquired treasure, and was going to bounce unceremoniously into the old lumber-room over the lobby to regale my sight with the delightful confusion of his unarranged accumulations, when he pulled me forcibly back by the coat-tail. 'Not there,' said Jack; 'you can't go there. Go into my snugery.'

'And why not there?' said I; jealous of some new purchase which I was not to see.

'Because there's somebody ill there—it is a bedroom now: a poor girl; she wanted a place to die in, poor thing, and I put her in there.'

'Who is she?—a relative?'

'No; I never saw her till Monday last. Sit down, I'll tell you how it was. Set down the coffee, Mrs Jones, and just look in upon the patient, will you? Sugar and cream? You know my weakness for the dead wall in Lincoln's Inn Fields.' (Jack never refuses a beggar backed by that wall, for the love of Ben Jonson, who, he devoutly believes, had a hand in building it.) 'Well, I met with her there on Monday last. She asked for nothing, but held out her hand, and as she did so the tears streamed from her eyes on the pavement. The poor creature, it was plain enough, was then dying; and I told her so. She said she knew it, but had no place to die in but the parish workhouse, and hoped that I would not send her there. What's the use of talking? I brought her here, and put her to sleep on the sofa while Jones cleared out the lumber-room and got up a bed. I sent for Dr H—— to look at her; he gave her a week or ten days at the farthest: I don't think she'll last so long. The curate of St—— comes every day to see her, and I like to talk to her myself sometimes. Well, Mrs Jones, how goes she on?'

'She's asleep,' said the housekeeper. 'Would you like to look at her, gentlemen?'

We entered the room together. It was as if some unaccountable presentiment had forewarned me: there, upon a snow-white sheet, and pillowed by my friend's favourite eider-down squab, lay the wasted form of Ellen D——. She slept soundly and breathed loudly; and Dr H——, who entered while we stood at the bedside, informed us that in all probability she would awake only to die, or if to sleep again, then to wake no more. The latter was the true prophecy. She awoke an hour or two after my departure, and passed away that same night in a quiet slumber without a pang.

I never learned by what chain of circumstances she was driven to seek alms in the public streets. I might have done so perhaps by inquiry, but to what purpose? She died in peace, with friendly hands and friendly hearts near her, and Jack buried her in his own grave in Highgate Cemetery, at his own expense; and declares he is none the worse for it. I am of his opinion.

NOTES FROM AUSTRALIA.

LETTERS from working-men have been published in great numbers by the home-press, but a voice from the tradesman has seldom been heard; or, if heard, has not been attended to. I trust in some measure to supply the deficiency to those middle-class townsfolk who seek to emigrate to Australia.

1st, I can only reconcile the different accounts furnished by emigrants—believing people to write as they think at the time—by remembering that some have come from quiet rural places, and others from populous towns. The first will consider Geelong—its beautiful bay, ships, and steamers, as a bustling, improving, and increasing town, laid out for a future provincial capital; the last will regard it as a dull, detached series of villages, which

will some day be a large town. A modification of these causes, allowing for age, temperament, circumstances, and station in life, will explain any ordinary discrepancy in the accounts from this country.

2d, The various accounts of the climate must in a measure be traced to the same causes. People used to out-door labour in Britain find the winter so mild, that everything is lauded to the skies; those used to nice, roomy, convenient houses at home, finding themselves so very differently situated, condemn climate, prospects, and everything. Both may convey a false impression. The cold or heat by the thermometer is no test of sensation; days, however warm, are exceedingly agreeable, except the hot-wind days, which are absolutely indescribable, yet I have seen some men work out all day in the worst of them. They cause great relaxation in the system, and produce dysentery, especially among children. Compared with other hot countries, this appears to be the most agreeable.

3d, *Employment*.—This is readily to be obtained by working mechanics of all kinds in the towns; remembering that a very small sprinkling of workmen for finer work—such as cornice-mouldings, fine freestone work, cabinet-work, &c.—will be able to find employment for a long time to come, because, till a new generation spring up, who can live upon the accumulations of their sires, money will not be diverted to any great extent from business in land, buildings, or merchandise. A considerable number of labourers will find employment about the towns, at the stores, on the wharfs, &c. at about 24s. weekly. Country work on the sheep-stations—as shepherds, drivers of bullock-drays, sheep-washing and shearing, cooking for the men, &c.—is remunerated by about L.25 and food. These live far off in the solitary plains, almost apart from men, and come to town once, twice, or thrice a year, as their distance and employment may determine. The Sabbath has little of the religious character for them, and they know little of the progress of mankind. Agriculture also employs men at about the same rate. There is no probability of wages falling, for a long time to come, with any stream of emigration likely to come out hither; for if the country cannot grow more wool, a greater attention to its quality would employ more men; and agriculture will absorb a vast population as soon as the land-question has been fairly overhauled, and settled on a foundation that will allow a small capitalist to obtain, at a fair price, a suitable farm: besides, everything necessary to civilisation has yet to be done—roads, bridges, quarries, wells, and a long *et cetera* that one can scarcely catalogue.

4th, *Capitalists of L.1000 and upwards* can make, apart from wool-growing, twenty per cent. on their money without being in trade, chiefly by buying at the government land-sales, and subdividing the section into small allotments, or by building houses, shops, &c. The average of rental returns the capital in four years. But this can only be done if emigration continues—and emigration with a sprinkling of holders of L.50 to L.200. If this stops, there can be few purchasers. Should a fixed price be put upon government land, there might be a difference in the way in which capital could be turned to profit; but L.1000 and upwards can find so many favourable investments in a new colony, that a living could be secured without much trouble or anxiety.

5th, *Population*.—By the census just completed, there are 78,000 inhabitants in Victoria (Port-Philip); County of Bourke, 44,000—including Melbourne, the capital, 20,000; County of Grant, 12,000—including Geelong, its capital, 8000. Warramboul, Belfast, and Portland, along the coast, only number hundreds, and Kilmore, forty miles inland, nearly 2000: there are also various villages—on paper—so called, numbering ten to fifty houses each. From this it will be seen that more than half of the entire population is within twenty miles of Melbourne, a third of the residue within fifteen miles of Geelong, and the remainder scattered, including the 1200 squatting-stations, over a very extensive country. These towns are not, in my opinion, a natural growth, but have been forced into their present magnitude from the difficulties in obtaining land at a price to make up for the utter want of every

convenience, a want arising from the total absence of any effort on the part of the government hitherto to make even one great trunk-road through the colony. Facilities for internal communication would cause towns to increase naturally. Now, people arrive with glowing ideas of the beauty and fertility of the country, and finding everything difficult of access there, betake themselves to shopkeeping, forcing up rents to an exorbitant sum, and losing their little capital. I think my opinion borne out by the fact, that the country population of Grant County was 1959 in 1846, and 4469 in 1851; Geelong in 1846 had 1911, and in 1851, 8000—the town population more than quadrupling itself in the last five years, the county increasing only 2510. Melbourne and Bourke County are nearly in the same position.

There are seven or eight merchants in Geelong who import goods of all kinds, twenty-two drapery establishments in a respectable way, besides numbers of small ones on the outskirts; other trades are proportionately overdone. Melbourne is, I am credibly informed, equally crowded. These facts shew that there is no opening for people in business. A great imposition is practised by stating the increase of a town at so much per cent., or having doubled or trebled itself in so short a time, the fact being that even its present condition may be that only of a village. Interested parties too often talk their places into notice; and if people do not deal in 'notions,' they all have some allotment that will just suit you, which they don't care to keep any longer.

An argument from the amount of imports is made use of unfairly. The United States are set down at 30s. per head, Australia about £7 per head. This latter, they say, is the country to encourage, to emigrate to—see how prosperous it is! being blind, apparently, to the fact, that Australia, having nothing as yet but the raw material, tallow and wool, it must barter all it has for what it wants—a proof to me as much of necessity as of prosperity. Many more persons cannot engage profitably in the wool and tallow trade; the field is therefore narrow for general purposes of emigrants, and easily liable to be overstocked, unless the government take prompt measures to open out the abundant internal resources of minerals, &c. and give easier and cheaper possession of land: then, though the imports might not be much more, the prosperity would be much greater. America I believe to be in this latter position, presenting a more varied field for the operations of the small capitalist, though her imports may be inconsiderable per head.

I ought to state, that a great many of the reported cases of success are, from misapprehension of the real circumstances of the parties, either quite false, or calculated to mislead. Doubtless many successful hits will be made by purchasers of mineral land, and so are successful hits made at the gaming-table. Successful men, besides, are well known, while the unsuccessful have slunk away and are forgotten. Few fortunes have been made by simple shopkeeping.

I ought not to conclude without referring to farming, although not practically acquainted with it; indeed, the accounts from farmers differ as much as the size and shape of their farms: but it appears to me that, from one or other of the following causes, farming has not hitherto paid well.—A large farm has been purchased, leaving too little cash to spare for the erection of houses, fences, and cultivation; or leaving it burdened with a mortgage at heavy interest; or a short lease—of three years—has been taken, and the money sunk on the improvements; or the cultivation has been of such a wretched description as failed to raise a remunerative crop. There never appears to have been a want of sufficient market for any field-produce. £1000 judiciously invested on a farm, I believe, would pay.

I trust it will be seen that my object in writing the foregoing has been to guard against the pictures of climate and scenery, good or bad, that are constantly written; to shew that plenty of employment at a remunerative wage is to be had, but only of the heavy and laborious kind; that there is a wide field for capitalists;

but that shopkeepers and townspeople, unused to out-door labour, have a poor chance, owing to the smallness of the population and the competition which already exists.

GROUND-LIZARD OF JAMAICA.

One feature with which a stranger cannot fail to be struck on his arrival in the island, and which is essentially tropical, is the abundance of the lizards that everywhere meet his eye. As soon as ever he sets foot on the beach, the rustlings among the dry leaves, and the dartings hither and thither among the spiny bushes that fringe the shore, arrest his attention; and he sees on every hand the beautifully coloured and meek-faced ground-lizard (*Ameiva dorsalis*), scratching like a bird among the sand, or peering at him from beneath the shadow of a great leaf, or creeping stealthily along with its ohin and belly upon the earth, or shooting over the turf with such a rapidity that it seems to fly rather than run. By the road-sides, and in the open pastures, and in the provision-grounds of the negroes, still he sees this elegant and agile lizard; and his prejudices against the reptile races must be inveterate indeed if he can behold its gentle countenance, and timid but bright eyes, its chaste but beautiful hues, its graceful form and action, and its bird-like motions, with any other feeling than admiration.

As he walks along the roads and lanes that divide the properties, he will perceive at every turn the smooth and trim little figure of the wood-slaves (*Mabouya agilis*) basking on the loose stones of the dry walls; their glossy, fish-like scales glistening in the sun with metallic brilliancy. They lie as still as if asleep; but on the intruder's approach, they are ready in a moment to dart into the crevices of the stones and disappear until the danger is past.

If he looks into the outbuildings of the estates, the mill-house, or the boiling-house, or the cattle-sheds, a singular croaking sound above his head causes him to look up; and then he sees clinging to the rafters, or crawling sluggishly along with the back downward, three or four lizards, of form, colour, and action very diverse from those he has seen before. It is the *gecko* or croaking lizard (*Thecodactylus larvia*), a nocturnal animal in its chief activity, but always to be seen in these places or in hollow trees even by day. Its appearance is repulsive, I allow, but its reputation for venom is libellous and groundless.

The stranger walks into the dwelling-house: lizards, lizards, still meet his eye. The little anoles (*A. iodurus*, *A. opalinus*, &c.) are chasing each other in and out between the jealousies, now stopping to protrude from the throat a broad disk of brilliant colour, crimson or orange, like the petal of a flower, then withdrawing it, and again displaying it in coquettish play. Then one leaps a yard or two through the air, and alights on the back of his playfellow; and both struggle and twist about in unimaginable contortions. Another is running up and down on the plastered wall, catching the ants as they roam in black lines over its whitened surface; and another leaps from the top of some piece of furniture upon the back of the visitor's chair, and scampers nimbly along the collar of his coat. It jumps on the table—can it be the same? An instant ago it was of the most beautiful golden green, except the base of the tail, which was of a soft, light, purple hue; now, as if changed by an enchanter's wand, it is of a sordid, sooty brown all over, and becomes momentarily darker and darker, or mottled with dark and pale patches of a most unpleasant aspect. Presently, however, the mental emotion, whatever it was—anger, or fear, or dislike—has passed away, and the lovely green hue sparkles in the glancing sunlight as before.

He lifts the window-sash; and instantly there run out on the sill two or three minute lizards of a new kind, allied to the *gecko*, the common palette-tip (*Sphaerodactylus argus*). It is scarcely more than two inches long, more nimble than fleet in its movement, and not very attractive.

In the woods he would meet with other kinds. On the

trunks of the trees he might frequently see the Venus (*Dactyloa Edwardsii*), as it is provincially called; a lizard much like the anoles of the houses, of a rich grass-green colour, with orange throat-disk, but much larger and fiercer; or, in the eastern parts of the island, the great iguana (*Cyclura lophoma*), with its dorsal crest like the teeth of a saw running down all its back, might be seen lying out on the branches of the trees, or playing bo-peep from a hole in the trunk; or, in the swamps and morasses of Westmoreland, the yellow galliwasp (*Celestus occiduus*), so much dreaded and abhorred, yet without reason, might be observed sitting idly in the mouth of its burrow, or feeding on the wild fruits and marshy plants that constitute its food.—*Gosse's Naturalist's Sojourn.*

A SCENE IN NEW ENGLAND.

I leave Boston sometimes in the evening by rail, get thirty miles off, then strike away into byways, ramble for an hour or two, and get back to the rail. I was out yesterday, and nothing can equal the colour of the foliage: if it was painted, it would look like fancy. In the course of my stroll, I came upon a lake entirely surrounded with forest, and containing, as I was informed, about four square miles of water, studded with islands varying in size from one to twenty acres. I would describe a point of view which enchanted me. I was on one side of the lake, where it is about half a mile in width: about half-way across, for the foreground of my picture, is a small island, about two acres, covered with trees, looking as if they grew out of the lake, with a central one of at least eighty feet high, and of the purest orange colour. The opposite shore is of a crescent shape, with the forest rising like an amphitheatre behind, glowing with every imaginable colour, from the intense crimson to the pale pink, and looking exactly like an enormous flower-garden stretching away to the distance, and the colour so strongly reflected in the water, that it is difficult to tell the reality from the reflection. At home in England, I would have gone far to see such scenes; but they are here at every turn. I enclose you some leaves, but the purity of the colour is gone after a few hours. I am sure many valuable additions might be made to the European stock of flowers: there are thousands of species—some extremely beautiful; but how they are propagated, or whether they could be transplanted, I cannot tell, being no horticulturist. Among the millions here, one plant would be much admired with you. It grows wild about three feet high, with long, curiously-formed leaves, and surmounted by bunches of bright scarlet blossoms, exactly like the geranium. In the course of my stroll, I came upon a genuine shanty of a new settler, full of fine children. The husband away at work—a little patch cleared for Indian corn and a few vegetables, the sturdy trees enclosing all. Truly the pair have their work before them, but they have likewise hope and comfort. I chatted a little while with the wife, a genuine specimen of the Anglo-Saxon race—clean, industrious, and hopeful: left home to avoid being starved, and sat down here, in rude comfort, with her ruddy children growing up about her—to be a joy and a support, instead of the drag and vexation they would have proved at home.—*Private Letter from an English Artist settled at Boston.*

WOMEN.

Christianity freed woman, because it opened to her the long-closed world of spiritual knowledge. Sublime and speculative theories, hitherto confined to the few, became, when once they were quickened by faith, things for which thousands were eager to die. Simple women meditated in their homes on questions which had long troubled philosophers in the groves of academies. They knew this well; and felt that from her who had sat at the feet of the Master, listening to the divine teaching, down to the poorest slave who heard the tidings of spiritual liberty, they had all become daughters of a great and immortal faith. Of that faith women were the earliest adherents, disciples, and martyrs. Women followed Jesus, entertained the wandering apostles, worshipped in the catacombs, or died in the arena. The Acts of the

Apostles bear record to the charity of Dorcas and the hospitality of Lydia; and tradition has preserved the memory of Praxedes and Pudentiana, daughters of a Roman senator, in whose house the earliest Christian meetings were held in Rome.—*Women of Christianity, by Julia Kavanagh.*

'WHARE'ER THERE'S A WILL THERE IS ALWAYS A WAY.'

LANGSYNE, when I first gaed to schule, I was glaiket, In books and in learning nae pleasure had I; And when for my fauts wi' the taws I was paiket, 'I canna do better,' was aye my reply. 'Deed Rab,' quo my mither, 'for daffin' and playin' There's nocht ye can manage by nicht or by day; But this let me tell ye, and mind what I'm sayin'— Whare'er there's a will there is always a way.

'Just look at our preacher, when but a bit callan, The ills o' cauld poortith he aft had to dree, But to better his lot the poor chiel aye was willin'— At schule and at wark ever eident was he: Sage books he wad read, and their truths he wad cherish, And earnestly sprauchle up learning's steep brae; And noo he's Mess John o' his ain native parish— Sae whare there's a will there is always a way.

'And man, if ye saw how his manse is bedecked! Ilk room's like a palace, it's plenished sae fine; And then wi' the best in the land he's the respecter, And aft wi' My Lord is invited to dine. O Rab, then, be active; frae him tak' example; His case speaks mair powerfu' than ocht I can say; And soon ye will find that your talents are ample; For whare there's a will there is always a way.

'What though we are cotters!—the poorest may flourish, And wha wadna rise wi' the glorious few! Industry works wonders—its spirit aye nourish— It isna the drone gathers hinney, I trow. Then onward, my laddie! ye canna regret it; What wrecks and what tears have been caused by delay! If noble your wish is, press on, ye will get it! For whare there's a will there is always a way.'

Thus spak my auld mither: ilk word seemed a sermon, But just rather warldly, as ane might alloo; But, haith, it inspired me, and made me determine To haud to the lair and keep progress in view. Sae I tried ilka project instruction to gather: When herdin' the sheep for our laird, Ringan Gray, The Bible and Bunyan, I read 'mang the heather— Aye whare there's a will there is always a way.

But my father he dee'd, and to help my auld mither I noo had to struggle wi' hardship and care; And aften I thocht I wad stick a' thegither, But something within me said: 'Never despair!' At last I grew bein, for I toiled late and early, Syne to Collegio I gaed, and was made a D.D. And noo I'm Mess John in the Kirk o' Glenfairly— Sae whare there's a will there is always a way.

The manse—but I shouldna wi' vanity crack o't— Is as cozie a beil as a body could see; Hauf-hid 'mang auld trees, wi' braw parks at the back o't, Whare lambs, 'mang the gowans, are sportin' wi' glee. I've got a bit wife too, a rich winsome lady— In short, I hae a' that a mortal could hae: Sae onward, ye youths! as my auld mither said aye— Whare'er there's a will there is always a way.

PRICE 1½d.

THE HAPPY JACKS.

'On Saturday, then, at two—humble hours, humble fare; but plenty, and good of its kind; with a talk over old fellows and old times.'

Such was the pith of an invitation to dinner, to accept which I started on a pleasant summer Saturday on the top of a Kentish-town omnibus. My host was Happy Jack. Everybody called him 'Happy Jack;' he called himself 'Happy Jack.' He believed he was an intensely 'Happy' Jack. Yet his friends shook their heads, and the grandest shook theirs the longest, as they added the ominous addendum of 'Poor Devil' to 'Happy Jack.'

'Seen that unhappy wretch, Happy Jack, lately?'

'Seen him! of course, yesterday: he came to borrow a half-sovereign, as two of his children had the measles. He was in the highest spirits, for the pawnbroker lent him more on his watch than he had expected, and so Jack considered the extra shilling or two pure gain. I don't know how the wretch lives, but he seems happier than ever.'

On another occasion, the dialogue would be quite different.

'Who do you think I saw last night in the first tier at the Opera?—who but Happy Jack, and Mrs Happy Jack, and the two eldest Happy Jack girls! Jack himself resplendent in diamond studs, and tremendously laced shirt-front; and as for the women—actually queens of Sheba. A really respectable carriage, too, at the door; for I followed them out in amazement: and off they went like so many lords and ladies. Oh, the sun has been shining somehow on the Happy Jacks!'

In due time I stood before the Terrace honoured by the residence of the Happy Jacks—one of those white, stuccoed rows of houses, with bright green doors and bright brass-plates thereon, which suburban builders so greatly affect. As I entered the square patch of front-garden, I perceived straw lying about, as though there had been recent packing; and looking at the drawing-room window, I missed the muslin curtain and the canary's brass cage swathed all over in gauze. The door opened before I knocked, and Happy Jack was the opener. He was clad in an old shooting-coat and slippers, had a long clay-pipe in his mouth, and was in a state of intense general *deshabille*. Looking beyond him, I saw that the house was in *deshabille* as well as the master. There were stairs certainly, but where was the stair-carpet? Happy Jack, however, was clearly as happy as usual. He had a round, red face; and, I will add, a red nose. But the usual sprightly smile stirred the red round face, the usual big guffaw came leaping from the largely opening mouth, the

usual gleam of mingled sharpness and *bonhomie* shone from the large blue eyes. Happy Jack closed the door, and, taking my arm, walked me backwards and forwards on the gravel.

'My boy,' he said, 'we've had a little domestic affair inside; but you being, like myself, a man of the world, we were not of course going to give up our dinner for that. The fact is,' said Jack, attempting to assume a heroic and sentimental tone and attitude, 'that, for the present at least, my household gods are shattered!'

'You mean that?'

'As I said, my household gods are shattered, even in the shrine!'

It was obvious that the twang of this fine phrase gave Jack uncommon pleasure. He repeated it again and again under his breath, flourishing his pipe, so as, allegorically and metaphorically, to set forth the extent of his desolation.

'In other words,' I went on, 'there has been an execution?'

'And the brokers have not left a stick. But what of that? These are accidents which will occur in the best?'

'And Mrs?'

'Oh! She, you know, is apt to be a little down-hearted at times; and empty rooms somehow act on her idiosyncrasy. A good woman, but weak. So she's gone for the present to her sisters; and as for the girls, why, Emily is with her mother, and Jane is at the Joneses. Very decent people the Joneses. I put Jones up to a thing which would have made his fortune the week before last; but he wouldn't have it. Jones is slow, and—well—And Clara is with the Hopkinsons: I believe so, at least; and Maria is—Confound me if I know where Maria is; but I suppose she's somewhere. Her mother managed it all: I didn't interfere. And so now, as you know the best and the worst, let's come to dinner.'

An empty house is a dismal thing—almost as dismal as a dead body. The echo, as you walk, is dismal; the blank, stripped walls, shewing the places where the pictures and the mirrors have been, are dismal; the bits of straw and the odds and ends of cord are dismal; the coldness, the stillness, the blankness, are dismal. It is no longer a habitation, but a shell.

In the dining-room stood a small deal-table, covered with a scanty cloth, like an enlarged towel; and a baked joint, with the potatoes under it, smoked before us. The foaming pewter-can stood beside it, with a couple of plates, and knives and steel forks. Two Windsor chairs, of evident public-house mould, completed the festive preparations and the furniture of the room. The whole thing looked very dreary; and as I

gazed, I felt my appetite fade under the sense of desolation. Not so Happy Jack. 'Come, sit down, sit down. I don't admire baked meat as a rule, but you know, as somebody says—

"When spits and jacks are gone and spent,
Then ovens are most excellent,"
And also most con-ven-i-ent.

The people at the Chequers managed it all. Excellent people they are. I owe them some money, which I shall have great pleasure in paying as soon as possible. No man can pay it sooner.'

The dinner, however, went off with the greatest success. Happy Jack was happier than ever, and consequently irresistible. Every two or three minutes he lugged in something about his household gods and the desolation of his hearth, evidently enjoying the sentiment highly. Then he talked of his plans of taking a new and more expensive house, in a fashionable locality, and furnishing it on a far handsomer scale than the old one. In fact, he seemed rather obliged to the brokers than otherwise for taking the quondam furniture off his hands. It was quite behind the present taste—much of it positively ugly. He had been ashamed to see his wife sitting in that atrocious old easy-chair, but he hoped that he had taken a step which would change all for the better. Warming with his dinner and the liquor, Happy Jack got more and more eloquent and sentimental. He declaimed upon the virtues of Mrs J., and the beauties of the girls. He proposed all their healths *seriatim*. He regretted the little incident which had prevented their appearance at the festive board; but though absent in person, he was sure that they were present in spirit; and with this impression, he would beg permission to favour them with a song—a song of the social affections—a song of hearth and home—a song which had cheered, and warmed, and softened many a kindly and honest heart: and with this Happy Jack sang—and exceedingly well too, but with a sort of dreadfully ludicrous sentiment—the highly appropriate ditty of *My Ain Fireside*.

Happy Jack was of no particular profession: he was a bit of a *littérateur*, a bit of a journalist, a bit of a man of business, a bit of an agent, a bit of a projector, a bit of a City man, and a bit of a West-end man. His business, he said, was of a general nature. He was usually to be heard of in connection with apocryphal companies and misty speculations. He was always great as an agitator. As soon as a League was formed, Happy Jack flew to its head-quarters as a vulture to a battle-field. Was it a league for the promotion of vegetarianism?—or a league for the lowering of the price of meat?—a league for reforming the national costume?—or a league for repealing the laws still existing upon the Statute-book against witches?—Happy Jack was ever in the thickest of the fray, lecturing, expounding, arguing, getting up extempore meetings of the frequenters of public-houses, of which he sent reports to the morning papers, announcing the 'numerous, highly respectable, and influential' nature of the assembly, and modestly hinting, that Mr Happy Jack, 'who was received with enthusiastic applause, moved, in a long and argumentative address, a series of resolutions pledging the meeting to,' &c. Jack, in fact, fully believed that he had done rather more for free-trade than Cobden. Not, he said, that he was jealous of the Manchester champion; circumstances had made the latter better known—that he admitted; still he could not but know—and knowing, feel—in his own heart of hearts, his own merits, and his own exertions.

The railway mania was, as may be judged, a grand time for Happy Jack. The number of lines of which he was a provisional director, the number of schemes which came out—and often at good premiums too—under his auspices; the number of railway journals which he founded, and the number of academies which

he established for the instruction of youthful engineers—are they not written in the annals of the period? Jack himself started as an engineer without any previous educational ceremony whatever. His manner of laying out a 'direct line' was happy and expeditious. He took a map and a ruler, and drew upon the one, by the help of the other, a straight stroke in red ink—which looked professional—from terminus to terminus. Afterwards, he stated distinctly in writing, so that there could be no mistake about the matter, that there were no engineering difficulties—that the landed proprietors along the line were quite enthusiastic in their promotion of the scheme—and that the probable profits, as deduced from carefully drawn-up traffic-tables, would be about 35 per cent. At this time, Happy Jack was quite a minor Hudson. He lived in an atmosphere of shares, scrip, and prospectuses. Money poured in from every quarter. A scrap of paper with an application for shares was worth the bright tissue of the Bank—and Jack lost no time in changing the one for the other. Amid the mass of railway newspapers, he started *The Railway Sleeper Awakened*, *The Railway Whistle*, *The Railway Turntable*, and *The Railway Time-table*; and it was in the first number of the last famous organ—it lived for three weeks—in which appeared a letter signed 'A Constant Reader.' After the bursting of the bubble, Happy Jack appeared to have burst too; for his whereabouts for a long time was unknown, and there were no traditions of his being seen. Then he began to be heard of from distant and constantly varying quarters of the town. Now you had a note from Shepherd's Bush, and next day from Bermondsey. On Tuesday, Jack dated Little King Street, Clapham Road; on Thursday, the communication reached you from Little Queen Street, Victoria Villas, Hackney; and next week perhaps you were favoured with a note from some of the minor little Inns of Court, where the writer would be found getting up a company on the fourth floor in a grimy room, furnished with a high deal-deak, two three-legged stools, and illimitable foolscap, pens, and ink.

Where Mrs Happy Jack and the young-lady Happy Jacks went to at these times, the boldest speculator has failed to discover: they vanished, as it were, into thin air, and were seen no more till the sunshine came, when they returned with the swallows. The lady herself was a meek, mild creature, skilful in the art of living on nothing, and making up dresses without material. She adored her husband, and believed him the greatest man in the world. On the occurrence of such little household incidents as an execution, or Jack making a rapid act of cabmanship from his own hearth to the cheerful residence of Mr Levi in Cursitor Street, the poor little woman, after having indulged herself in the small luxury of a 'good cry,' would go to work to pack up shirts and socks manfully, and with great foresight, would always bring Jack's daily food in a basket, seeing that Mr Levi's bills are constructed upon a scale of uncommon dimensions; after which, she would eat the dinner with him in the coffee-room, drink to better days, play cribbage, and at last get very nearly as joyous in that greasy, grimy, sorrow-laden room, with bars on the outside of the windows, as if it were the happy home she possessed a few weeks ago, and which she always hoped to possess again. As for the girls, they were trained by too good a master and mistress not to become apt scholars. They knew what a bill of sale was from their tenderest years; the broker's was no unfamiliar face; and they quite understood how to treat a man in possession. Their management of duns was consummate. Happy Jack used to listen to the comedy of excuses and coaxings; and when the importunate had departed, grumblingly and unpaid, he used solemnly to kiss his daughters on the forehead, and invoke all sorts of blessings upon his preservers, his good angels, his little girls, who were so clever, and so faithful, and so true.

And in many respects they were good girls. The style in which they turned frocks, put a new appearance upon hoods, and cloaks, and bonnets, and came forth in what seemed the very lustre of novelty—the whole got up by a skilful mutual adaptation of garments and parts of garments—was wonderful to all lady beholders. In cookery, they beat the famous chef who sent up five courses and a dessert, made out of a greasy pair of jack-boots and the grass from the ramparts of the besieged town. Their wonderful little made-dishes were mere scraps and fragments, which in any other house would have been flung away, but which were so artistically and scientifically handled by the young ladies, and so tossed up, and titivated, and eked out with gravies, and sauces, and strange devices of nondescript pasty, that Happy Jack, feasting upon these wonderful creations of ingenuity, used to vow that he never dined so well as when there was nothing in the house for dinner. To their wandering, predatory life the whole family were perfectly accustomed. A sudden turn out of quarters they cared no more for than hardened old dragoons. They never lost pluck. One speculation down, another came on. Sometimes the little household was united. A bit of luck in the City or the West had been achieved, and Happy Jack issued cards for 'At Homes,' and behaved, and looked, and spoke like an alderman, or the member of a house of fifty years' standing. When strangers saw his white waistcoat, and blue coat with brass buttons, and heard him talk of a glut of gold, and money being a mere drug, they speculated as to whether he was the governor or the vice-governor of the Bank of England, or only the man who signs the five-pound notes. That day six weeks, Jack had probably 'come through the court,' a process which he always used somehow to achieve with flying colours, behaving in such a plausible and fascinating way to the commissioner, that that functionary regularly made a speech, in which he congratulated Happy Jack on his candour, and evident desire to deal fairly with his creditors, and told him he left that court without the shadow of a stain upon his character. In the Bench, in dreary suburban lodgings, or in the comfortable houses which they sometimes occupied, the Happy Jacks were always the Happy Jacks. Their constitution triumphed over everything. If anything could ruffle their serenity, it was the refusal of a tradesman to give credit. But *uno avulso non deficit alio*, as Jack was accustomed, on such occasions, classically to say to his wife—presently deviating into the corresponding vernacular of—'Well, my dear, if one cock fights shy, try another.'

A list of Jack's speculations would be instructive. He once took a theatre without a penny to carry it on; and having announced *Hamlet* without anybody to play, boldly studied and performed the part himself, to the unextinguishable delight of the audience. Soon after this, he formed a company for supplying the metropolis with Punches of a better class, and enacting a more moral drama than the old legitimate one—making Punch, in fact, a virtuous and domestic character; and he drew the attention of government to the moral benefits likely to be derived to society from this dramatic reform. Soon after, he departed for Spain in the gallant Legion; but not finding the speculation profitable, turned newspaper correspondent, and was thrice in imminent danger of being shot as a spy. Flung back somehow to England, he suddenly turned up as a lecturer on chemistry, and then established a dancing institution and Terpsichorean Athenæum. Of late, Jack has found a good friend in animal magnetism, and his séances have been reasonably successful. When performing in the country districts, Jack varied the entertainments by a lecture on the properties of guano, which he threw in for nothing, and which was highly appreciated by the agricultural interest. Jack's books

were principally works of travel. His *Journey to the Fountains of the Niger* is generally esteemed highly amusing, if not instructive: it was knocked off at Highbury; and his *Wanderings in the Mountains of the Moon*, written in Little Chelsea, has been favourably reviewed by many well-informed and discriminating organs of literary intelligence, as the work of a man evidently well acquainted with the regions he professes to describe.

Where the Happy Jacks are at this moment no one can tell. They have become invisible since the last clean out. A deprecatory legend has indeed been in circulation, which professed that Jack was dead, and that this was the manner in which, on his deathbed, he provided for his family:—

'Mrs Happy Jack,' said the departing man, 'I'm not afraid of you. You have got on some way or other for nearly forty years, and I don't see why you shouldn't get on some way or other for forty more. Therefore, so far as you are concerned, my mind is easy. But, then, you girls—you poor little inexperienced poppets, who know nothing of the world. There's Jane; but then she's pretty—really beautiful. Why, her face is a fortune: she will of course captivate a rich man; and what more can a father wish? As for Emily—I fear Emily, my dear, you're rather plain than otherwise; but what, I would ask, is beauty?—fleeting, transitory, skin-deep. The happiest marriages are those of mutual affection—not one-sided admiration: so, on the whole, I should say that my mind is easier about Emily than Jane. As for Maria, she's so clever, she can't but get on. As a musician, an artist, an authoress, what bright careers are open for her! While as for you, stupid little Clara, who never could be taught anything—I very much doubt whether the dunces of this world are not the very happiest people in it—Yes, Clara; leave to others the vain and empty distinctions of literary renown, which is but a bubble, and be happy in the homely path of obscure but virtuous duty!'

Happy Jack ceased. There was a pause. 'And now,' he said, 'having provided for my family, I will go to sleep, with a clear conscience and a tranquil mind.'

I said that I always distrusted this legend. I am happy to say, that even as I write I have proof positive that it is purely a fiction. I have just had a card put into my hand requesting my presence at a private exhibition of the celebrated Bloomer Family, while an accompanying private note from Jack himself informs me that the 'celebrated and charming Bloomer group—universally allowed to be the most perfect and interesting representatives of the new régime in costume'—are no other than the Happy Jacks *redivivi*—Mrs J. and the girls donning the transatlantic attire, and Happy Jack himself delivering a lecture upon the vagaries of fashion and the inconsistencies of dress, in a new garment invented by himself, and combining the Roman toga with the Highland kilt.

THE DESERT HOME.*

ROBINSON CRUSOE is the parent of a line of fictions, all more or less entertaining; but those of our own day, as might be expected, share largely in the practical spirit of the time, making amusement in some degree the mere menstruum of information. Following the Swiss Family Robinson, we have here an English Family Robinson, which might as well be called an American Family Robinson; and although ostensibly meant for the holiday recreation of youth, it proves to be a production equally well suited for children of six feet and upwards. The author is personally familiar with the scenes he describes, and is thus able to give them a verisimilitude

* Or the Adventures of a Lost Family in the Wilderness. By Captain Mayne Reid. London: Bogue. 1862.

which in other circumstances can be attained only by the rarest genius; and notwithstanding the associations of his last book, the *Scalp-hunters*, there is only one bloody conflict in the present one fought by animals of the genus *Homo*.

The local habitation of the lost family is a nook in the Great American Desert—a nook in a desert twenty-five times the size of England! But this wilderness of about a million square miles is not all sand or all barren earth: it contains numerous other features of interest besides mountains and oases; it includes the country of New Mexico, with its towns and cities; the country round the Great Salt and Utah Lakes, where the germ of a Mormon nation is expanding on all sides; and it is traversed in its whole breadth by the Rocky Mountains. An English family, after being ruined in St Louis, and reduced to their last hundred pounds, are persuaded by a Scottish miner to accompany him across this desert to New Mexico. 'They are a wonderful people,' says the story-teller, 'these same Scotch. They are but a small nation, yet their influence is felt everywhere upon the globe. Go where you will, you will find them in positions of trust and importance—always prospering, yet, in the midst of prosperity, still remembering, with strong feelings of attachment, the land of their birth. They manage the marts of London, the commerce of India, the fur-trade of America, and the mines of Mexico. Over all the American wilderness you will meet them, side by side with the backwoods-pioneer himself, and even pushing him from his own ground. From the Gulf of Mexico to the Arctic Sea, they have impressed with their Gaelic names rock, river, and mountain; and many an Indian tribe owns a Scotchman for its chief.'

The adventurers join a caravan, which is attacked by Indians, and the family of the destined Robinson find themselves alone in the wilderness, 800 miles from the American frontier on the east, 1000 miles from any civilised settlement on either the north or south, and 200 miles from the farthest advanced lines of New Mexico in the desert. They are, in short, lost; but in due time they are found again by other explorers. These strangers are standing on the edge of a cliff several hundred feet sheer down. 'Away below—far below where we were—lay a lovely valley, smiling in all the luxuriance of bright vegetation. It was of nearly an oval shape, bounded upon all sides by a frowning precipice, that rose around it like a wall. Its length could not have been less than ten miles, and its greatest breadth about half of its length. We were at its upper end, and of course viewed it lengthwise. Along the face of the precipice there were trees hanging out horizontally, and some of them even growing with their tops downward. These trees were cedars and pines; and we could perceive also the knotted limbs of huge cacti protruding from the crevices of the rocks. We could see the wild mezcal, or maguey-plant, growing against the cliff—its scarlet leaves contrasting finely with the dark foliage of the cedars and cacti. Some of these plants stood out on the very brow of the overhanging precipice, and their long curving blades gave a singular character to the landscape. Along the face of the dark cliffs all was rough, and gloomy, and picturesque. How different was the scene below! Here everything looked soft, and smiling, and beautiful. There were broad stretches of woodland, where the thick foliage of the trees met and clustered together, so that it looked like the surface of the earth itself; but we knew it was only the green leaves, for here and there were spots of brighter green, that we saw were glades covered with grassy turf. The leaves of the trees were of different colours, for it was now late in the autumn. Some were yellow, and some of a deep claret colour: some were bright-red, and some of a beautiful maroon; and there were green, and brighter green, and others of a silvery-whitish hue.

All these colours were mingled together, and blended into each other, like the flowers upon a rich carpet. Near the centre of the valley was a large shining object, which we knew to be water. It was evidently a lake of crystal purity, and smooth as a mirror. The sun was now up to meridian height, and his yellow beams falling upon its surface caused it to gleam like a sheet of gold. We could not trace the outlines of the water, for the trees partially hid it from our view, but we saw that the smoke that had at first attracted us rose up somewhere from the western shore of the lake. In this strange oasis they found what appeared to be a snug farm-house, with stables and outhouses, garden and fields, horses and cattle. Here they were hospitably entertained by the proprietor, his wife, and two sons, and served by a faithful negro; and of course it is the history of the settlers, and their struggles, expedients, and contrivances which form the staple of the work.

In this history we have the process of building a log-house, and the usual modes of assembling round the squatter such of the comforts of life as may be obtained in the desert; but our family Robinson appears to have been the most ingenious as well as the most fortunate of adventurers, for there are very few, even of the luxuries of civilised society, which are beyond his reach. The natural history of the book, however, is its main feature; and the adventures of the lost family with the unreasoning denizens of the desert remind us not unfrequently of the pictures of Audubon. This is among the earliest:—'There were high cliffs fronting us, and along the face of these five large reddish objects were moving, so fast that I at first thought they were birds upon the wing. After watching them a moment, however, I saw that they were quadrupeds; but so nimbly did they go, leaping from ledge to ledge, that it was impossible to see their limbs. They appeared to be animals of the deer species, somewhat larger than sheep or goats; but we could see that, in place of antlers, each of them had a pair of huge curving horns. As they leaped downward, from one platform of the cliffs to another, we fancied that they whirled about in the air, as though they were "turning somersaults," and seemed at times to come down heads foremost! There was a spur of the cliff that sloped down to within less than a hundred yards of the place where we sat. It ended in an abrupt precipice, of some sixty or seventy feet in height above the plain. The animals, on reaching the level of this spur, ran along it until they had arrived at its end. Seeing the precipice, they suddenly stopped, as if to reconnoitre it; and we had now a full view of them, as they stood outlined against the sky, with their graceful limbs and great curved horns, almost as large as their bodies. We thought, of course, they could get no farther for the precipice, and I was calculating whether my rifle, which I had laid hold of, would reach them at that distance. All at once, to our astonishment, the foremost sprang out from the cliff, and whirling through the air, lit upon his head on the hard plain below! We could see that he came down upon his horns, and rebounding up again to the height of several feet, he turned a second somersault, and then dropped upon his legs, and stood still! Nothing daunted, the rest followed, one after the other, in quick succession, like so many street-tumblers; and, like them, after the feat had been performed, the animals stood for a moment, as if waiting for applause!' These were the *argali*, or wild sheep, popularly termed bighorns, and resembling an immense yellow goat or deer furnished with a pair of ram's horns.

Such are the anecdotes which the reader will find thickly scattered throughout this volume; but perhaps the most interesting are a series of conflicts witnessed by the father and one of the sons, and in the course of which they are themselves exposed to some danger. They had gone out to gather from the live oaks a kind

of moss, which they found to be quite equal to curled hair for stuffing mattresses; and while perched upon one of the trees, the drama opened by the violent scolding of a pair of orioles, or Baltimore birds—so called from their colour, a mixture of black and orange, being the same as that in the coat-of-arms of Lord Baltimore. The cause of the disturbance appeared to be a nondescript animal close to the edge of the thicket, with a variety of little legs, tails, heads, ears, and eyes stuck over its body. 'All at once the numerous heads seemed to separate from the main body, becoming little bodies of themselves, with long tails upon them, and looking just like a squad of white rats! The large body to which they had all been attached we now saw was an old female opossum, and evidently the mother of the whole troop. She was about the size of a cat, and covered with woolly hair of a light gray colour. . . . The little 'possums were exact pictures of their mother—all having the same sharp snouts and long naked tails. We counted no less than thirteen of them, playing and tumbling about among the leaves.' The old 'possum looked wistfully up at the nest of the orioles, hanging like a distended stocking from the topmost twigs of the tree. After a little consideration she uttered a sharp note, which brought the little ones about her in a twinkling. 'Several of them ran into the pouch which she had caused to open for them; two of them took a turn of their little tails around the root of hers, and climbed up on her rump, almost burying themselves in her long wool; while two or three others fastened themselves about her neck and shoulders. It was a most singular sight to see the little creatures holding on with "tails, teeth, and toe-nails," while some peeped comically out of the great breast-pocket.' Burdened in this way, she climbed the tree, and then taking hold of the young 'possums, one by one, with her mouth, she made them twist their tails round a branch, and hang with their heads downwards. 'Five or six of the "kittens" were still upon the ground. For these she returned, and taking them up as before, again climbed the tree. She disposed of the second load precisely as she had done the others, until the thirteen little 'possums hung head downwards along the branch like a string of candles!'

The mother now climbed higher up; but the nest, with its tempting eggs, hung beyond her reach; and although she suspended herself by the tail—at last almost by its very tip—and swung like a pendulum, clutching as she swung, it was all in vain. At length, with a bitter snarl, she gave up the adventure as hopeless, detached the young ones from their hold, flung them testily to the ground, and descending, took them all into her pouch and upon her back, and trudged away. 'Frank and I now deemed it proper to interfere, and cut off the retreat of the old 'possum: so, dropping from our perch, we soon overtook and captured the whole family. The old one, on first seeing us approach, rolled herself into a round clump, so that neither her head nor legs could be seen, and in this attitude feigned to be quite dead. Several of the youngsters who were outside, immediately detached themselves, and imitated the example of their mother—so that the family now presented the appearance of a large ball of whitish wool, with several smaller "clews" lying around it! The family Crusoes, however, were not to be cheated: they took the whole prisoners, intending to carry them home; and making the mother fast to one of the saplings, returned to their tree.

Soon the persecuted orioles began to scream and scold as before. Their enemy this time was a huge moccason, one of the most venomous of serpents. 'It was one of the largest of its species; and its great flat head, protruding sockets, and sparkling eyes, added to the hideousness of its appearance. Every now and then, as it advanced, it threw out its forked tongue, which, moist with poisonous saliva, flashed under the

sunbeam like jets of fire. It was crawling directly for the tree on which hung the nest.' The birds seemed to think he meant to climb to their nest, and descended in rage and terror to the lower branches. 'The snake, seeing them approach almost within range of his hideous maw, gathered himself into a coil, and prepared to strike. His eyes scintillated like sparks of fire, and seemed to fascinate the birds; for instead of retiring, they each moment drew nearer and nearer, now alighting on the ground, then flapping back to the branches, and anon darting to the ground again—as though they were under some spell from those fiery eyes, and were unable to take themselves away. Their motions appeared to grow less energetic, their chirping became almost inaudible, and their wings seemed hardly to expand as they flew, or rather fluttered, around the head of the serpent. One of them at length dropped down upon the ground within reach of the snake, and stood with open bill, as if exhausted, and unable to move farther. We were expecting to see the snake suddenly launch forth upon his feathered victim; when all at once his coils flew out, his body was thrown at full length, and he commenced retreating from the tree! The object that caused this diversion was soon visible. 'It was an animal about the size of a wolf, and of a dark-gray or blackish colour. Its body was compact, round-shaped, and covered, not with hair, but with shaggy bristles, that along the ridge of its back were nearly six inches in length, and gave it the appearance of having a mane. It had very short ears, no tail whatever, or only a knob; and we could see that its feet were hooved, not clawed as in beasts of prey. But whether beast of prey or not, its long mouth, with two white tusks protruding over the jaws, gave it a very formidable appearance. Its head and nose resembled those of the hog more than any other animal; and in fact it was nothing else than the peccary—the wild hog of Mexico.'

The moccason did not wait to parley with his enemy, but skulked away through the long grass, every now and then raising his head to glare behind him. But the peccary tracked him by the smell, and on coming up to him, uttered a shrill grunt. 'The snake, finding that he was overtaken, threw himself into a coil, and prepared to give battle; while his antagonist, now looking more like a great porcupine than a pig, drew back, as if to take the advantage of a run; and then halted. Both for a moment eyed each other—the peccary evidently calculating its distance—while the great snake seemed cowed and quivering with affright. Its appearance was entirely different from the bright semblance it had exhibited but a moment before when engaged with the birds. Its eyes were less fiery, and its whole body seemed more ashy and wrinkled. We had not many moments to observe it, for the peccary was now seen to rush forward, spring high into the air, and pounce down with all her feet held together upon the coils of the serpent! She immediately bounded back again; and, quick as thought, once more rose above her victim. The snake was now uncoiled, and writhing over the ground. Another rush from the peccary, another spring, and the sharp hoofs of the animal came down upon the neck of the serpent, crushing it upon the hard turf. The body of the reptile, distended to its full length, quivered for a moment, and then lay motionless along the grass. The victor uttered another sharp cry, that seemed intended as a call to her young ones, who, emerging from the weeds where they had concealed themselves, ran nimbly forward to the spot.'

While the father and son are watching the peccary peeling the serpent as adroitly as a fishmonger would skin an eel, another actor enters upon the scene. This was the dreaded cougar, an animal of the size of a calf, and with the head and general appearance of a cat. Creeping stealthily round his victim, who is busy

feasting on the quarry, he at length attains the proper vantage-ground, and gathering himself up like a cat, springs with a terrific scream upon the back of the peccary, burying his claws in her neck, and clasp her all over in his fatal embrace. 'The frightened animal uttered a shrill cry, and struggled to free itself. Both rolled over the ground—the peccary all the while gnashing its jaws, and continuing to send forth its strange sharp cries, until the woods echoed again. Even the young ones ran around, mixing in the combat—now flung sprawling upon the earth, now springing up again, snapping their little jaws, and imitating the cry of their mother. The cougar alone fought in silence. Since the first wild scream not a sound had escaped him; but from that moment his claws never relaxed their hold, and we could see that with his teeth he was silently tearing the throat of his victim.'

The Robinsons of the desert were now in an awkward predicament; for although they had been safe from the peccary, the cougar could climb a tree like a squirrel. A noise, however, disturbs him from his meal, and swinging the dead animal on his back, he begins to skulk away. But he is interrupted before he can reach cover; and as the new-comers prove to be twenty or thirty peccaries, summoned to the field by the dying screams of their comrade, he has more to do than to think of his dinner. To fling down his burden, to leap upon the foremost of his enemies, is but the work of an instant; but the avengers crowd round him with their gnashing jaws and piercing cries, and the brute darts up the tree like a flash of red fire, and crouches not twenty feet above the heads of the horrified spectators! The father, however, after some agonising moments of deliberation, brings him down with his rifle; and the cougar, falling among the eager crowd below, is torn to pieces in a moment. But this does not get rid of the peccaries, who set up their fiendish screams anew as they discover two other victims in the tree. The father fires again and again, dropping his peccary each time, till five lie dead upon the ground; but the rage of the rest only becomes more and more furious—and the marksman is at his last bullet. Here we shall leave him; and such of our readers as may be interested in his fate—who form, we suspect, a very handsome percentage on the whole—may make inquiries for themselves at his Desert Home.

THE VATTEVILLE RUBY.

THE clock of the church of Besançon had struck nine, when a woman about fifty years of age, wrapped in a cotton shawl and carrying a small basket on her arm, knocked at the door of a house in the Rue St Vincent, which, however, at the period we refer to, bore the name of Rue de la Liberté. The door opened. 'It is you, Dame Margaret,' said the porter, with a very cross look. 'It is high time for you. All my lodgers have come home long since; you are always the last, and'—

'That is not my fault, I assure you, my dear M. Thiebaud,' said the old woman in a deprecatory tone. 'My day's work is only just finished, and when work is to be done'—

'That's all very fine,' he muttered. 'It might do well enough if I could even reckon on a Christmas-box at the end of the year; but as it is, I may count myself well off, if I do but get paid for taking up their letters.'

The old woman did not hear the last words, for with quick and firm step she had been making her way up the six flights of stairs, steep enough to make her head reel had she been ascending them for the first time. 'Nine o'clock!—nine o'clock! How uneasy she must be!' and as she spoke, she opened with her latch-

key the door of a wretched garret, in which dimly burned a rushlight, whose flickering flame scarcely seemed to render visible the scanty furniture the room contained.

'Is that you, my good Margaret?' said a feeble and broken voice from the farther end of the little apartment.

'Yes, my dear lady; yes, it is I; and very sorry I am to have made you uneasy. But Madame Lebriton, my worthy employer, is so active herself, that she always finds the workwoman's day too short—though it is good twelve hours—and just as I was going to fold up my work, she brought me a job in a great hurry. I could not refuse her; but this time, I must own, I got well paid for being obliging, for after I had done, she said in her most good-natured way: "Here, you shall take home with you some of this nice pie, and this bottle of good wine, and have a comfortable supper with your sister." So she always calls you, madame,' added Margaret, while complacently glancing at the basket, the contents of which she now laid out upon the table. 'As I believe it is safest for you, I do not deceive her, though it is easily known she cannot have looked very close at us, or she might have seen that I could only be the servant of so noble-looking a lady'—

The feeble voice interrupted her: 'My servant!—you my servant! when, instead of rewarding your services, I allow you to toil for my support, and to lavish upon me the most tender, the most devoted affection! My poor Margaret! you who have undertaken for me at your age, and with your infirmities, daily and arduous toil, are you not indeed a sister of whom I may well be proud? Your nobility has a higher origin than mine. Reduced by political changes, which have left me homeless and penniless, I owe everything to you; and so tenderly do you minister to me, that even in this garret I could still almost fancy myself the noble Abbess of Vatteville!'

As she spoke, the aged lady raised herself in her old arm-chair, and throwing back a black veil, disclosed features still beautiful, and a forehead still free from every wrinkle, and eyes now sparkling with something of their former brilliancy. She extended her hand to Margaret, who affectionately kissed it; and then, apprehensive that further excitement could not but be injurious to her mistress, the faithful creature endeavoured to divert her thoughts into another channel, by inviting her to partake of the little feast provided by the kindness of her employer. Margaret being in the habit of taking her meals in the house where she worked, the noble Lady Marie Anne Adelaide de Vatteville was thus usually left alone and unattended, to eat the scanty fare prescribed by the extreme narrowness of her resources; so that she now felt quite cheered by the novel comfort, not merely of the better-spread table, but of the company of her faithful servant; and it was in an almost mirthful tone she said, when the repast was ended: 'Margaret, I have a secret to confide to you. I will not—I ought not to keep it any longer to myself.'

'A secret, my dear mistress! a secret from me!' exclaimed the faithful creature in a slightly reproachful tone.

'Yes, dear Margaret, a secret from you; but to be so no longer. No more henceforth of the toils you have undergone for me; they must be given up: I cannot do without you. At my age, to be left alone is intolerable. When you are not near me, I get so lonely, and sometimes feel quite afraid, I cannot tell of what, but I suppose it is natural to the old to fear; and often—will you believe it?—I catch myself weeping like a very child. Ah! when age comes on us, we lose all

strength, all fortitude. But you will not leave me any more? Promise me, dear Margaret.

'But in that case what is to become of us?' said Margaret.

'This is the very thing I have to tell. And now listen to me. Take this key, and in the right-hand drawer of the press you will find the green casket, where, among my letters and family papers, you will see a small case, which bring to me.'

Margaret, not a little surprised, did as she was desired. The abbess gazed on the case for some moments in silence, and Margaret thought she saw a tear glisten in her eye as she pressed the box to her lips, and kissed it tenderly and reverentially.

'I have sworn,' she said, 'never to part with it; yet what can I do? It must be so: it is the will of God.' And with a trembling hand, as if about to commit sacrilege, she opened the case, and drew from it a ruby of great brilliancy and beauty. 'You see this jewel?' she said. 'Margaret, it is the glory of my ancient house; it is the last gem in my coronet, and more precious in my eyes than anything in the world. My grand-uncle, the noblest of men, the Archbishop of Besançon, brought it from the East; and when, in gurdion for some family service, Louis XIV. founded the Abbey of Vatteville, and made my grand-aunt the first abbess of the order, he himself adorned her cross with it. You now know the value of the jewel to me; and though I cannot tell its marketable value, still, notwithstanding the pressure of the times, I cannot but think it must bring sufficient to secure us, for some time at least, from want. Were I to consider myself alone, I would starve sooner than touch the sacred deposit; but to allow you, Margaret, to suffer, and to suffer for me—to take advantage any longer of your disinterested affection and devoted fidelity—would be base selfishness. God has at last taught me that I was but sacrificing you to my pride, and I must hasten to make atonement. I will endeavour to raise money on this jewel. You know old M. Simon? Notwithstanding his mean appearance and humble mode of living, I am persuaded he is a rich man; and though parsimonious in the extreme, he is good-natured and obliging whenever he can be so without any risk of loss to himself.'

The next day, in pursuance of her project, the abbess, accompanied by Margaret, repaired to the house of M. Simon. 'I know, sir,' she said, 'from your kindness to some friends of mine, that you feel an interest in the class to which I belong, and that you are incapable of betraying a confidence reposed in you. I am the Abbess of Vatteville. Driven forth from the plundered and ruined abbey, I am living in the town under an assumed name. I have been stripped of everything; and but for the self-sacrificing attachment of a faithful servant, I must have died of want. However, I have still one resource, and only one. I know not if I am right in availing myself of it, but at my age the power to struggle fails. Besides, I do not suffer alone; and this consideration decides me. Will you, then, have the goodness to give me a loan on this jewel?'

'I believe, madame, you have mistaken me for a pawnbroker. I am not in the habit of advancing money in this way. I am myself very poor, and money is now everywhere scarce. I should be very glad to be able to oblige you, but just at present it is quite out of the question.'

For a moment the poor abbess felt all hope extinct; but with a last effort to move his compassion, she said: 'Oh, sir, remember that secrecy is of such importance to me, I dare not apply to any one else. The privacy, the obscurity in which I live, alone has prevented me from paying with my blood the penalty attached to a noble name and lineage.'

'But how am I to ascertain the value of the jewel?'

I am no jeweller; and I fear, in my ignorance, to wrong either you or myself.'

'I implore you, sir, not to refuse me. I have no alternative but to starve; for I am too old to work, and beg I cannot. Keep the jewel as a pledge, and give me some relief.'

Old Simon, though covetous, was not devoid of feeling. He was touched by the tears of the venerable lady; and besides, the more he looked at the jewel, the more persuaded he became of its being really valuable. After a few moments' consideration, he said: 'All the money I am worth at this moment is 1500 francs; and though I have my suspicions that I am making a foolish bargain, I had rather run any risk than leave you in such distress. The next time I have business in Paris, I can ascertain the value of the jewel, and if I have given you too little, I will make it up to you.' And with a glad and grateful heart the abbess took home the 1500 francs, thankful at having obtained the means of subsistence for at least a year.

Some months later, old Simon went up to Paris, and hastening to one of the principal jewellers, shewed the ruby, and begged to know its value. The jeweller took the stone carelessly; but after a few moments' examination of it, he cast a rapid glance at the threadbare coat and mean appearance of the possessor, and then abruptly exclaimed: 'This jewel does not belong to you, and you must not leave the house till you account for its being in your possession. Close the doors,' he said to his foreman, 'and send for the police.' In vain did Simon protest his innocence; in vain did he offer every proof of it. The lapidary would listen to nothing; but at every look he gave the gem, he darted at him a fresh glance of angry contempt. 'You must be a fool as well as a knave,' he said. 'Do you know, scoundrel, that this is the Vatteville—the prince of rubies; the most splendid, the rarest of gems! It might be deemed a mere creation of imagination, were it not enrolled and accurately described in the archives of our art. See here, in the *Guide des Lapidaires*, a print of it. Mark its antique fashioning, and that dark spot!—yes, it is indeed the precious ruby so long thought lost. Rest assured, fellow, you shall not quit the house until you satisfy me how you have contrived to get possession of it.'

'I should at once have told you, but from unwillingness to endanger the life of a poor woman who has confided in me. I got the jewel from the Abbess de Vatteville herself, and it is her last and only resource.' And now M. Simon proved, by unquestionable documents, that notwithstanding his more than humble appearance, he was a man of wealth and respectability, and received the apologies which were tendered, together with assurances that Madame Vatteville's secret was safe with one who, he begged to say, 'knew how to respect misfortune, whenever and however presented to his notice.'

'But what is the jewel worth?' asked M. Simon.

'Millions, sir! and neither I nor any one else in the trade here could purchase it, unless as a joint concern, and in case of a coronation or a marriage in one of the royal houses of Europe, for such an occasion alone could make it not a risk to buy it. But meanwhile I will, if you wish, mention it to some of the trade.'

'I am in no hurry,' said Simon, almost bewildered by the possession of such a treasure. 'I may as well wait for some such occasion, and in the meantime can make any necessary advances to the abbess. Perhaps I may call on you again.'

The first day of the year 1795 had just dawned, and there was a thick and chilling fog. The abbess and her faithful servant felt this day more than usually depressed, for fifteen months had now elapsed since the 1500 francs had been received for the ruby, and there now remained provision only for a few days longer. 'I have got no answer from M. Simon,' said the

abbess; and in giving utterance to her own thought, she was replying to what was at that moment passing through Margaret's mind. 'I fear he has not been able to get more for the ruby than he thinks fair interest for the money he advanced to me.'

'It is most likely,' said Margaret; and both relapsed into their former desponding silence.

'What a dreary New-Year's Day!' resumed Madame de Vatteville, in a melancholy tone.

'Oh, why can I not help you, dear mistress?' exclaimed Margaret, suddenly starting from her reverie. 'Cheerfully would I lay down my life for you!'

'And why can I not return in any way your devoted attachment, my poor Margaret?'

At this instant, two loud and hurried knocks at the door startled them both from their seats, and it was with a trembling hand Margaret opened it to admit the old porter, and a servant with a letter in his hand.

'Thank you, thank you, M. Thiebaud: this letter is for my mistress.' But the inquisitive old man either did not or would not understand Margaret's hint to him to retire, and Madame de Vatteville was obliged to tell him to leave the room.

'Not a penny to bless herself with, though she has come to a better apartment!' muttered he, enraged at the disappointment to his curiosity—'and yet as proud as an aristocrat!'

The abbess approached the casement, broke the seal with trembling hand, and read as follows:—'I have at length been able to treat with a merchant for the article in question, and have, after much difficulty, obtained a sum of 25,000 francs—far beyond anything I could have hoped. But the sum is to be paid in instalments, at long intervals. It may therefore be more convenient for you, under your peculiar circumstances, to accept the offer I now make of a pension of 1500 francs, to revert after your decease to the servant whom you mentioned as so devotedly attached to you. If you are willing to accept this offer, the bearer will hand you the necessary documents, by which you are to make over to me all further claim upon the property placed in my hands; and on your affixing your signature, he will pay you the first year in advance. SIMON.'

'What a worthy, excellent man!' joyfully exclaimed the abbess; for, in the noble integrity of her heart, she had no suspicion that he could take advantage of her circumstances.

However Simon settled the matter with his conscience, the abbess, trained in the school of adversity to be content with being preserved from absolute want, passed the remainder of her life quietly and happily with her good Margaret, both every day invoking blessings on the head of him whom they regarded as a generous benefactor. Madame de Vatteville lived to the age of one hundred, and her faithful Margaret survived only a few months the mistress to whom she had given such affecting proofs of attachment.

But Simon's detestable fraud proved of no use to him. After keeping his treasure for several years, he thought the Emperor's coronation presented a favourable opportunity for disposing of it. Unfortunately for him, his grasping avarice one morning suggested a thought which his ignorance prevented his rejecting: 'Since this ruby—old-fashioned and stained as it is—can be worth so much, what would be its value if freed from all defect, and in modern setting?' And he soon found a lapidary, who, for a sum of 3000 francs, modernised it, and effaced the spot, and with it the impress, the stamp of its antiquity—all that gave it value, beauty, worth! This wanting, no jeweller could recognise it: it was no longer worth a thousand crowns.

It was thus that the most splendid ruby in Europe lost its value and its fame; and its name is now only

to be found in *The Lapidaries' Guide*, as that which had once been the most costly of gems. It seemed as if it could not survive the last of the illustrious house to which it owed its introduction into Europe, and its name.

HENRY TAYLOR.

'There is delight in singing, though none hear
Beside the singer: and there is delight
In praising, though the praiser sit alone,
And see the praised far off him, far above.'

—W. S. LONDON.

It has been said, with more of truth than flattery, that literature of any kind which requires the reader himself to think, in order to enjoy, can never be popular. The writings of Mr Henry Taylor are to be classed in this category. The reader of his dramas must study in order to relish them; and their audience, therefore, must be of the fit, though few kind. Goethe somewhere remarks, that it is not what we take from a book so much as what we bring to it that actually profits us. But this is hard doctrine, caviare to the multitude. And so long as popular indolence and popular distaste for habits of reflection shall continue the order of the day, so long will it be difficult for writers of Mr Taylor's type to popularise their meditations; to see themselves quoted in every provincial newspaper and twelfth-rate magazine; to be gloriously pirated by eager hordes at Brussels and New York; or to create a furor in 'the Row' on the day of publication, and turn bibliopolic premises into 'overflowing houses.' The public asks for glaring effects, palpable hits, double-dyed colours, treble X inspirations, concentrated essence of sentiments, and emotions up to French-romance pitch. With such a public, what has our author in common? While they make literary demands after their own heart, and expect every candidate for their not evergreen laurels to conform to their rules, Mr Taylor calmly unfolds his theory, that it is from 'deep self-possession, an intense repose' that all genuine emanations of poetic genius proceed, and expresses his doubt whether any high endeavour of poetic art ever has been or ever will be promoted by the stimulation of popular applause.* He denies that youth is the poet's prime. He contends that what constitutes a great poet is a rare and peculiar balance of all the faculties—the balance of reason with imagination, passion with self-possession, abundance with reserve, and inventive conception with executive ability. He insists that no man is worthy of the name of a poet who would not rather be read a hundred times by one reader than once by a hundred. He affirms that poetry, unless written simply to please and pamper, and not to elevate or instruct, will do little indeed towards procuring its writer a subsistence, and that it will probably not even yield him such a return as would suffice to support a labouring man for one month out of the twelve.† Tenets like these are not for the million. The propounder they regard as talking at them, not to them. His principles and practice, his canons of taste, and his literary achievements, are far above out of their sight—his merit they are content to take on trust, by the hearing of the ear, a mystery of faith alone.

Perhaps men shrewder than good Sir Roger de Coverley might aver that much is to be said on both sides—that there may be something of fallacy on the part of poet as well as people in this controversy. It is possible to set the standard too high as well as too low—to plant it on an elevation so distant that its symbol can no longer be deciphered, as well as to fix it so low that its folds drizzle in mire and dust. If genius systematically appeal only to the initiated few, it must learn to do without the homage of the outer

* Notes from Life.

† Ibid.

multitude. For its slender income of fame, it has mainly itself to thank. These remarks apply with primary force to that class of contemporary poets who delight in the mystic and enigmatical, and whose ideas are so apt to vanish, like Homer's heroes, in a cloud—among whom Robert Browning and Philip J. Bailey are conspicuous names; and in a secondary degree to that other class, lucid indeed in thought, and classically definite in expression, but otherwise too scholastic and abstract for popular sympathies—among whom we may cite Walter Savage Landor and Henry Taylor. Coleridge* tells us that, to enjoy poetry, we must combine a more than ordinary sympathy with the objects, emotions, or incidents contemplated by the poet, consequent on rare sensibility, with a more than ordinary activity of the mind in respect of the fancy and imagination. This more than ordinary mental activity is especially demanded from the readers—say rather the students—of *Philip van Artevelde* and its kindred dramas. Those who are thus equipped will commonly be found to agree in admiring the writings of this author; among them he is unquestionably 'popular,' if it be any test of popularity to send forth a second edition three months after the first. Scholarship can appreciate, pure intellect can find nutriment in, his reflective and carefully-wrought pages. His heroes and heroines, cold and unimpassioned to the man of society, are classic and genial to the man of thought. A Quarterly Reviewer observes, that the blended dignity of thought, and a sedate moral habit, invests his poetry with a stateliness in which the drama is generally deficient, and makes his writings illustrate, in some degree, a new form of the art. In all that he writes he stands revealed the true English gentleman, 'that grand old name,' as Tennyson calls it,

'Defamed by every charlatan,
And soiled with all ignoble use.'

Isaac Comnenus—in which a recent critic discovers much of that Byronian vein upon which Mr Taylor is severe in his own criticisms—being little remarkable in itself, as well as the least remarkable of his dramatic performances, need not detain us. The career of *Philip van Artevelde* belongs to an era when, as Sir James Stephen remarks, the whole of Europe, under the influence of some strange sympathy, was agitated by the simultaneous discontents of all her great civic populations—when the insurgent spirit, commencing in the Italian republics, had spread from the south to the north of the Alps, everywhere marking its advance by tumult, spoil, and bloodshed. 'Wat Tyler and his bands had menaced London; and the communes of Flanders, under the command of Philip van Artevelde, had broken out into open war with the counts, their seigneurs, and with their suzerain lord, the Duke of Burgundy. On the issue of that attempt the fate of the royal and baronial power seemed to hang in France, not less than in Flanders.'† The drama composed by Mr Taylor to represent the fortunes of the 'Chief Captain of the White Hoods and of Ghent,' consists of two plays and an interlude—*The Lay of Elena*—and being, as he says in his preface, equal in length to about six such plays as are adapted to the stage, was not, of course, intended to solicit the most sweet voices of pit and gallery, although it has since been subjected to that ordeal at the instance of Mr Macready. Historic truth is said to be preserved in it, as far as the material events are concerned—with the usual exception of such occasional dilatations and compressions of time as are required in dramatic composition. And notwithstanding the limited imagination and the too artificial passion which characterise it, *Philip van Artevelde* is in very many respects a noble work, as it certainly is its author's chef-d'œuvre. It has been pronounced by

no mean authority the superior of every dramatic composition of modern times, including the *Sardanapalus* of Lord Byron, the *Remorse* of Coleridge, and the *Cenci* of Shelley. The portraiture of Philip is one of those elaborate and highly-finished studies which repay as well as require minute investigation. He is at once profoundly meditative and surpassingly active. His energy of brain is only rivalled by his readiness of hand. In him the active mood and the passive—the practical and the ideal—the objective and the subjective—are not as parallel lines that never meet, but are sections of one line, describing the circle of his all-embracing mind. His youth has been that of a dreamy recluse, the scorn of men of the world. 'Oh, fear him not, my lord,' says one of them to the Earl of Flanders:

—'His father's name
Is all that from his father* he derives.
He is a man of singular address
In catching river fish. His life hath been
Till now, more like a peasant's or a monk's,
Than like the issue of so great a man.'

Similarly the earl himself describes him as 'a man that as much knowledge has of war as I of brewing mead—a bookish nursing of the monks—a meacock.' But when the last scene of all has closed his strange eventful history, the testimony of a nobler, wiser foe,† ascribes to him great gifts of courage, discretion, wit, an equal temper, an ample soul, rock-bound and fortified against assaults of transitory passion, but founded on a surging subterranean fire that stirs him to lofty enterprise—a man prompt, capable, and calm, wanting nothing in soldiership except good fortune. Ever tempted to reverie, he yet refuses, even for one little hour, to yield up the weal of Flanders to idle thought or vacant retrospect. Having once put his hand to the plough of action, with clear foresight, not blindfold bravery, his language is—'Though I indulge no more the dream of living, as I hoped I might have lived, a life of temperate and thoughtful joy, yet I repine not, and from this time forth will cast no look behind.' The first part of the drama leaves him an exultant victor, an honourable, prosperous, and happy man. The second part—which alike in interest and treatment is very inferior to the first—finds him falling, and leaves him 'fallen, fallen, fallen from his high estate.' His sun, no longer trailing clouds of glory, sets in a wintry and misty gloom. And yet in the act of dying he emits flashes of the ancient brightness, and we feel that so dies a hero. The other *dramatis personæ* pale their ineffectual fires before his central light.

After a silence of nearly ten years—characteristic of Mr Taylor's deliberative and disciplined mind—he produced (1842) *Edwin the Fair*, of whose story the little that was known, he observes, was romantic enough to have impressed itself on the popular memory—the tale of *Edwy and Elgiva* having been current in the nursery long before it came to be studied as a historical question. In illustrating this tale he borrows from the bordering reigns 'incidents which were characteristic of the times,' though some are of opinion, that his deviation from historical truth has rather impaired than aided the poetical effect of the drama. With artistic skill, and often with sustained energy, he develops the career of the 'All-Fair' prince, and his relation to the monkish struggle of the tenth century; the hostile intrigues and stormy violence of Dunstan; the loyal tenacity and Saxon frank-heartedness of Earl Leolf and his allies; the celebrated coronation-scene, and 'most admired disorder' of the banquet; the discovery and denunciation of Edwin's secret nuptials;

* Namely, Jacques van Artevelde, 'the noblest and the wisest man that ever ruled in Ghent,' and whom the factional citizens slew at his own door.

his imprisonment in the Tower of London; the confusion and dispersion of his adherents; the ecclesiastical finesse and conjuror-tricks of Dunstan; the king's rescue and temporary success; the murder of Elgiva, and Edwin's own death in the essay to avenge her. It is around Dunstan, the representative of spiritual despotism, that the interest centres. The character of this 'Saint,' like that of Hildebrand and a Becket, has been made one of the problems of history. Mr Taylor's reading of the part is masterly, and we think correct. His Dunstan is not wholly sane; he believes himself inspired to read the alphabet of Heaven's stars, and to behold visions beyond the bounds of human foresight; one of the few to whom, 'and not in mercy, is it given to read the mixed celestial cypher: not in mercy, save as a penance merciful in issue.' His mischievous influence over the popular mind is sealed by the partial and latent degree of his insanity, for 'madness that doth least declare itself endangers most, and ever most infects the unsound many.' His great natural powers are tainted by the one black spot; his youth has been devoted to books, to the study of chemistry and mechanics; his manhood to observing 'the ways of men and policies of state' in the court of Edred; 'and were he not pushed sometimes past the confines of his reason, he would o'ertop the world.' Next to him in interest comes Earl Leolf, from whose lips proceed some of the finest poetry in the play, especially that exquisite soliloquy* on the sea-shore at Hastings. Athulf, the brother of Elgiva, is another happy portrait—a man bright and jocund as the morn, who can and will detect the springs of fruitfulness and joy in earth's waste places, and whose bluff dislike of Dunstan is aptly illustrated in the scene where he brings the king's commands, and is kept waiting by the monks during Dunstan's matutinal flagellation:—

'Athulf. But, sirs, it is in haste—in haste extreme—
Matters of state, and hot with haste.

Second Monk. My lord,
We will so say, but truly at this present
He is about to scourge himself.

Athulf. I'll wait.
For a king's ransom would I not cut short
So good a work! I pray you, for how long!

Second Monk. For twice the *De Profundis*, sung in
slow time.

Athulf. Please him to make it ten times, I will wait.
And could I be of use, this knotted trifle,
This dog-whip here has oft been worse employed.'

In his recent play, *The Virgin Widow* (1850), Mr Taylor declines from the promise of his earlier efforts. The preface suggests great things; but they are not forthcoming. There is much careful finish, much sententious rhetoric, much elegant description; but there is little of racy humour (the play is a 'romantic comedy'), little of poetical freshness, little of lively flesh and blood portraiture, and more of melodramatic expedience than dramatic construction. Neither comedy nor melodrama is our author's forte.

In 1836 Mr Taylor published *The Statesman*, a book which contained the 'views and maxims respecting the

transaction of public business,' which had been suggested to its author by twelve years' experience of official life. He has since then allowed that it was wanting in that general interest which might possibly have been felt in the results of a more extensive and varied conversancy with public life.* In 1848 he produced *Notes from Life*, professedly a kind of supplemental volume to the former, embodying the conclusions of an attentive observation of life at large. The first essay investigates in detail the right measure and manner to be adopted in getting, saving, spending, giving, taking, lending, borrowing, and bequeathing 'money'; and a weighty, valuable essay it is, with no lack of golden grains and eke of diamond-dust in its composition. The thoughts are not given in the bullion lump, but are well refined, and having passed through the engraver's hands, they shine with the true polish, ring with the true sound. In terse, pregnant, and somewhat oracular diction, we are here instructed how to avoid the evils contingent upon bold commercial enterprise—how to guard against excesses of the accumulative instinct—how to exercise a thoroughly conscientious mode of regulating expenditure, eschewing prodigality, that vice of a weak nature, as avarice is of a strong one—how to be generous in giving; 'for the essence of generosity is in self-sacrifice, waste, on the contrary, comes always by self-indulgence'—how to withstand solicitations for loans, when the loans are to accommodate weak men in sacrificing the future to the present. The essay on *Humility and Independence* is equally good, and pleasantly demonstrates the proposition, that Humility is the true mother of Independence; and that Pride, which is so often supposed to stand to her in that relation, is in reality the step-mother by whom is wrought the very destruction and ruin of Independence. False humilities are ordered into court, and summarily convicted by this single-eyed judge, whose cross-examination of these 'sham respectabilities' elicits many a suggestive practical truth. There is more of philosophy and prudence than of romance in the excursus on *Choice in Marriage*; but the philosophy is shrewd and instructive, uttering many a homely hint of value in its way: as where we are reminded that if marrying for money is to be justified only in the case of those unhappy persons who are fit for nothing better, it does not follow that marrying without money is to be justified in others; and again, that the negotiations and transactions connected with marriage-settlements are eminently useful, as searching character and testing affection, before an irrevocable step be taken; and again, that when two very young persons are joined together in matrimony, it is as if one sweet-pea should be put as a prop to another. The essay on *Wisdom* is elevated and thoughtful, like most of the essayist's papers, but somewhat too heavy for miscellaneous readers. With his wonted clearness he distinguishes Wisdom from understanding, talents, capacity, ability, sagacity, sense, &c. and defines it as that exercise of the reason into which the heart enters—a structure of the understanding rising out of the moral and spiritual nature. Then follows a section on *Children*, which explodes not a few educational fallacies, and propounds certain articles of faith and practice wholesome for these times, though it will probably wear a prim and quakerish aspect to the admirers of Jean Paul's famous tractate† on the same theme. The concluding paper in this series, entitled *The Life Poetic*, is the liveliest, if not the most valuable of the six: it has, however, been charged, with considerable show of justice, with a tendency to strip genius of all that is individual and spontaneous, or to accredit it only 'when it moves abroad sedately, clad in the uniform of a peculiar college.' Mr Taylor's 'solicitous and premeditated formalism' of poetical doctrine is, it must

* Beginning:—

'Rocks that beheld my boyhood! Perilous shelf
That nursed my infant courage! Once again
I stand before you—not as in other days
In your gray faces smiling; but like you
The worse for weather.' . . .

How sweet the lines:—

'The sun shall soon
Dip westerly; but oh! how little like
Are life's two twilights! Would the last were first,
And the first last! that so we might be soothed
Upon the thoroughfares of busy life
Beneath the noon-day sun, with hope of joy
Fresh as the morn,' &c.

—Act II. scene ii.

* Preface to *Notes from Life*.

† *Levana*, of which an able translation was published by Messrs Longman in 1848.

be confessed, a little too strait-laced. The true poet is born, not made. Still, in their place, our author's dogmas have their use, and might, if duly marked and inwardly digested, annually deter many aspirants who are not poets from proving so incontestably to the careless public that negative fact.

Notes from Books followed within a few months, but met with a less cordial reception. Of the four essays comprised in this volume, three are reprinted contributions to the *Quarterly Review*, being criticisms on the poetry of Wordsworth and Aubrey de Vere; and worthily do they illustrate—those on Wordsworth at least—Mr Taylor's composite faculty of depth and delicacy in poetical exposition. Of Wordsworth's many and gifted commentators—among them Wilson, Coleridge, Hazlitt, De Quincey, Lamb, Moir, Sterling—few have shewn a happier insight into the idiosyncrasy, or done more justice to the beauties of the patriarch of the Lakes. With Wordsworth for a subject, and the *Quarterly Review* for a 'door of utterance,' Mr Taylor is quite in his element. The fourth essay, on the *Ways of the Rich and Great*, is enriched with wise saws and modern instances. Its *matériel* is composed of ripe observation and reflective good sense; but the manner is objected to as marred by conceits of style—a sin not very safely to be committed by so stern a censor of it in others. His authoritative air in laying down the law is also occasionally displeasing to some readers; and great as his tact in essay-writing is, he wants that easy grace and pervading *bonhomie* which imparts such a charm to the works of one with whom he has been erroneously identified—the anonymous author of *Friends in Council*. But, after all, he is one of those writers to whom our current literature is really indebted, and whose sage, sententious, and well-hammered thoughts may be profitably, as well as safely, commended to every thinking soul among us.

RAILWAY JUBILEE IN AMERICA.

THE opening in September last of the grand railway which unites Massachusetts with British North America is one of the most noticeable events of our times. Before this, the commercial path of transit from Europe lay from the Atlantic up the St Lawrence, the navigation of which—at all times difficult and dangerous—is closed by ice during five months of the year, and thus all intercourse through the States, except by sleighs, stopped. Now, goods may be brought direct to Boston and shipped to Europe, or unshipped at Boston for the Canadas without interruption. But in a moral and social point of view, the subject is still more important. Rivalry and bad feeling vanish before intercourse, and the locomotive mows down prejudices faster than corn falls before the Yankee reaping-machine.

When I heard that there was to be a *procession*, the word vulgarised the whole affair. It conjured up before my mind's eye our doings of the sort in England, with the Lord Mayor's Show at the head of them; and I concluded that the Yankee attempt would be still more trashy. Let us see how it turned out. I send you a newspaper for the details; but *here* you must be a spectator, with the whole picture dashing, mass by mass, upon your sensorium.

As the first requisite for enjoyment, it was a glorious day even for this climate. Nothing shews off a pageant like fine weather. I left home shortly after daybreak, and went to the Common, as it is called—a Park about as large as St James's, handsomely laid out, with long alleys, some parallel, others crossing at various angles, and all shaded by fine trees. The scene presented by this Park reminded me of Camacho's wedding in *Don*

Quixote, on a large scale. There stood the tent for the banquet, constructed to dine 3000 persons, and decorated with the flags of America and England streaming from the top, with the flags of other nations below. Close by, were large tents for the preparation of viands, surrounded with all the paraphernalia of a feast. In various places, booths had been erected by the city, for the gratuitous supply of all comers with pure iced water, and these were thronged throughout the day, especially with children. The pedestrian portion of the procession assembled in the Park, while the vehicles crowded all the adjacent streets. And now might be observed the various societies, with their bands of music; volunteer companies marching here and there, getting into step, arranging their order and practising their tunes. I was chatting with a raw Vermonter, who was as much a stranger as myself. 'In the name of creation,' he suddenly exclaimed, 'what tarnal screeching is that yonder?' 'That,' I said, 'is the bagpipes, the national music of Scotland.' 'That?' said he: 'it would clear a State of racoons in no time!' But the Scots had determined to shine, and they advanced: a tall Highlander first, in full costume, and blowing the pipes at his loudest; after him ten others, in full Highland costume, with a banner—the Scottish Friends; and about 200 with silk sashes, and walking three abreast. The Catholic Irishmen followed, with a banner displaying a portrait of the Pope and other Catholic emblems; and directly after came the Protestant Irishmen, with their banners and music. Why will they not associate thus in their own land? A very interesting portion of the assembling was a party of about a thousand fine-looking, hardy men, all remarkably clean, dressed in labourers' costume—blue blouses and white trousers—headed by a band of music playing Irish popular tunes, with a large banner of the stars and stripes, and the word 'Liberty,' with the inscription—'The Irish Labourers. Under this we find Protection for our Labour.'

The Park is an irregular square. On the north side, on the highest point of the city, stands the State-House, where the legislature meets. Near that is the house which was formerly inhabited by the governor, at the time the British flag waved where there now fly, glancing in the sun, the stars and stripes. As the president was expected at the State-House, and the procession was to start from thence, that was the point of attraction, where the spectators formed into a vast, dense, and steady mass. We English are in the habit of seeing the paraphernalia of courts, and are slow to disconnect the ideas of pomp and state from the persons of those who hold power and distinction; but the chief of this great nation, together with the secretary of state, had arrived in town by railway in an ordinary carriage, without the least parade, and the corporation had hired for the occasion an open carriage-and-four—such an equipage as would have passed quite unnoticed in an English provincial town. Let me here observe, that by an ordinary carriage I mean a carriage open to all; for in America there are no locomotive distinctions of 1st, 2d, and 3d classes. I never saw expectation more on tiptoe. A rattle round the corner was heard; then the noise of the wheels ceased, and then the president—a tall, gentlemanly-looking, elderly man—was ascending the steps of the State-House; and as soon as his gray locks were seen by the immense multitude, such a shout arose as only Anglo-Saxon lungs can raise and prolong. The president turned round on the landing of the steps, took off his hat, bowed, and entered the hall. I have seen many ceremonies, regal and imperial, which passed off very much like a scene at a theatre; but I felt the sublime simplicity of this. There is no road to dis-

tion here but talent; and as the fine old man stood on the steps bowing, with Mr Webster, Secretary of State, by his side, they looked the very embodiment of intellect, and the manly, overpowering shout of the crowd the recognition of it. The multitudinous voices died away in the distance with a peculiar effect. No firing of guns. While on this part of the subject, I may mention my strong impression, that in no place is the government so much respected as in America. The public press may ridicule and joke upon certain acts of individuals; but whatever side is taken, there is nothing that can bring the laws, or those who administer them, into disrespect. This produces order to an extent unknown elsewhere. No one seems to question the law or the commands of its officers excepting Europeans, who bring their turbulent habits with them.

Leaving this imposing scene, I turned to the route of the procession, which had been advertised to pass through certain streets. In some degree to account for the masses of human beings that filled them, the three railways had kept pouring people in for three days, and the trains, immediately on arrival, turned back to fetch the thousands they had left waiting at the stations. It was said that there never was such a gathering in one place since the independence of the States. The arrangements of the pageant were made by the committee of the city; but the audience, or public, arranged themselves, and never was there anything better done. Along the whole line of streets, about three miles in length, the goods had been removed from the shop-windows, and their places filled with ladies. Every window that commanded a view was appropriated to females and children, who were likewise in many cases on the tops of the houses. Men occupied the pavement to the kerbstone. The roadway was kept by deputy-marshals, who rode up and down, in black dress suits, cocked, open hats, and white sashes; and in this vast assemblage their every request was immediately attended to. At the end of every street, carriages of all descriptions were placed, filled with people. As an instance of the courtesy of the spectators, my wife had handed our Little Red Ridinghood to some gentleman on the top of an omnibus, who very kindly held her up to see the show, and took charge of her while Mrs W—— found her way to the window, where her place had been kept. If anything could mark the kindly disposition and good order of the crowd, it was the fact, that although I should think all the children in the city were there, not one was hurt, but everybody exerted himself to accommodate this interesting portion of the community. Across the streets, and at all available points, the stars and stripes waved proudly in the air, and altogether the scene was most beautiful and imposing. I walked the whole length of the route before the procession moved, and the *coup d'œil* was perfect. The military portion looked remarkably well; but when the open carriage appeared in which rode Lord Elgin and his friends, the representative of Great Britain was greeted with such shouts and by such waving of handkerchiefs from the windows by crowds of elegantly dressed females, as I am sure his lordship can never forget. On his part, Lord Elgin continued bowing in acknowledgment, almost without intermission, for two hours and twenty minutes—the time occupied in passing.

Nearly equal to this was the enthusiasm elicited by the appearance of an open carriage, drawn by four grays, and containing only two men, wellnigh ninety years of age, then the sole survivors, in the State of Massachusetts, of those who fought in the War of Independence. It is the custom to shew honour to the survivors of that event on all public occasions. On the 4th of July last, the last public gathering, there were four in the carriage: two are gone. Before the carriage, was carried the banner of Washington, used in the struggle.

When these old men raised their withered hands to remove their hats, in reply to the welcome of the crowd, they appeared like spirits of the past. In all probability, they will not appear in public again; but the fruits of their courage will live for ever. The appropriateness and beauty of the arrangement of details were remarkable in the representation of the particular trades. The most imposing objects were the two new locomotives, shining brilliantly in their might of brass and steel, and richly painted; and as they loomed in sight, turning the bends of the streets, they were truly magnificent and appropriate objects. Each was raised upon a car, so that, on the whole, it was thirty feet high; it was drawn by eighteen iron-gray horses, all in line, decorated with blue ribbons, and handsomely caparisoned; each horse being led by a workman, in clean, new, working costume. The next was a procession on foot. Eight negroes, in Eastern costume, walked as guards round a platform, carried palanquin-fashion by four negroes, with 5000 ounces of manufactured silver-plate, built up in a pyramid, and forming a splendid object, fully equal in workmanship to anything of the kind I have seen. A very interesting part of the pageant was the children of the different schools, in four-wheeled cars, covered with drapery, and decorated with flowers and plants; and it was really pleasing to see the happy little creatures enjoying such a holiday as they would never forget. It is impossible to give a third of the details of this unique procession; but I cannot omit to notice the last feature—the labourers on their truck-horses. These were the carmen of the town. Their clean, healthy, happy faces, with their glossy horses, decorated with ribbons, made me regard them as the best and proudest cavalry a nation could have. These are all men who, a very short time since, landed from the Old World—fugitives from misery and starvation.

I had a ticket offered me for the banquet, but I preferred being outside among the people. I have had enough of dinner-speeches in my time, although this occasion was one of peculiar interest. The Park continued to be crowded to excess; and as the company arrived, they were greeted by the people and the bands of music stationed here and there. But what sound is that? They are drinking toasts within; and one is now given which stirs the vast multitude like an electrical shock. I cannot hear at first, the roar is so deafening: but presently I am able to analyse the sounds that have caused the commotion; and I confess it is with a beating heart, and a sort of choking sensation in the throat, I hear every lip repeat—'The Queen of England!' and every band in the Park take up from the music in the tent our own national strain, till the whole atmosphere vibrates with *God save the Queen!* The effect was magical, and I felt gratified beyond measure—not alone at the compliment to our country, but as evidence that the Anglo-Saxons are still one great community, and that the proceedings of that day would rivet between the two countries the bond of common blood. The day closed as happily as it had begun, and the streets were crowded up to a late hour. I was in all the thickest of the press, and I know that there was not a single accident, nor did I see or hear of any instance of drunkenness or disorder. All was harmony and good-humour.

I would mention, as a strong proof of the growing interest felt for the old country here, in New England especially, that almost every family is desirous of being known to be connected with it. They have all English names; and a numerous society have employed a gentleman of skill in such matters for the last ten years in England in tracing out the English branches of the different families in the State, so as to have the genealogy complete. This has become a passion; and I have found every person I met who could trace his

descent from the mother-country proud of it. I fell in, the other day, with a highly intelligent American, who told me with quite a feeling of pride, that his grandfather and grandmother were English, and his wife's father a Scot.

THINGS TALKED OF IN LONDON.

January 1862.

NOTWITHSTANDING our busy and acquisitive propensities, we of the metropolis have found time to wish one another a happy new-year, and to send friendly greetings to our country cousins also. We don't like to take the step from one year into another without a *coup d'amitié*. Besides all which, we are in the habit of considering ourselves at the present season more than ever entitled to partake of the recreations offered us, whether theatrical, musical, pictorial, saltatorial, philosophical, or scientific. And so, while simple-minded people are looking into the new almanacs to test the accuracy of the predictions, I must try to fill a page or two with such matters of talk as will bear reproduction in print.

First of all, among the discussions and communications at the Astronomical Society, it is stated that the term 'meteoric astronomy' is one which we shall shortly be able to use with almost absolute certainty, as M. Petit of Toulouse has succeeded in determining the orbits of meteors relatively to the sun as well as to the earth. His conclusions are considered valuable, especially with respect to the meteor of August 19, 1847, which, it appears, came 'from the regions of space beyond our system,' having, as is estimated, occupied more than 873,000 years in passing from its point of departure to its fall in the North Sea, near the shores of Belgium! This is another addition to our knowledge of meteoric phenomena which affords promise of further results. Certain members of the same society are still at work on what has been a tedious task—the restoration of the standard yard, rendered necessary, as you will remember, by the destruction of the original in the Parliament-House conflagration, more than ten years ago. The work proceeds slowly but surely, as the extremest pains are taken to insure accuracy, the measurements, bisections, and graduations being read off with a microscope. When finished, it will be centuplicated or more, if necessary, and, as is said, a copy deposited in every corporate town in the kingdom. This restoration of the standard is not so easy a task as would be commonly supposed, for apart from the determination of the yard with mathematical accuracy, alternations of heat and cold have to be taken into account; for, as is well known, a strip of metal which measures thirty-six inches long in a temperature of 70 degrees, will not measure the same in 50 degrees. Connected with this subject, it was stated at one of the meetings of the society, that the ancient Saxon yard was nearly identical with the modern French *mètre*; whence a suggestion of 'the possibility of the Saxon yard being actually derived from a former measure of the earth, made at a period beyond the range of history, the results of which have been preserved during many centuries of barbarism.' Be this as it may, we are now given to understand that the Egyptian Pyramids, whether originally erected for purposes of sepulchre or not, are, at the same time, definite portions of a degree of the earth's surface in the meridian of Egypt; and it has been proposed, as these mighty structures are far more durable even now than anything which we could build in England, that when our standard shall be re-established, the length shall be cut on the side of one of the pyramids, together with such explanatory particulars as may be necessary, so as to preserve the record for all coming time. Modern science thus availing itself of the labours of the past, would be a remarkable incident in the history of philosophy.

The appearance of extraordinary spots on the sun has attracted a more than ordinary degree of attention to that luminary, and to Mr J. Nasmyth's 'views respecting the source of light,' which, though published a few months since, are now again talked about. Mr Nasmyth, after several years' observation, comes to the conclusion, 'that whatever be the source of light, its production appears to result from an action induced on the exterior surface of the solar sphere,' and he believes it reasonable to 'consider the true source of the latent element of light to reside, *not in the solar orb*, but in space itself; and that the grand function and duty of the sun is to act as an agent for the bringing forth into vivid existence its due portion of the illuminating or luciferous element; which element he supposes to be diffused throughout the boundless regions of space, and which in that case must be perfectly exhaustless. Further, assuming this luciferous element to be not equally diffused through space, we find a reason why in some ages of the earth's history the heat should have been greater than at others, why stars have been seen to vary in brightness, and why there was that puzzle to geologists—a glacial period. During that period, according to Mr Nasmyth, with whose words I finish this part of my communication, 'an arctic climate spread from the poles towards the equator, and left the record of such a condition in glacial handwriting on the mountain walls of our elder mountain ravines, of which there is such abundant and unquestionable evidence.'

Our Microscopical Society have made a discovery in an all but invisible subject: they now state the *Volvox globator* to be a vegetable, and not, as has long been supposed, an animal, as its cells, presumed to be ova, are produced in the same way as in certain kinds of *algæ*. In the discussion excited by this announcement, it came out that several other minute forms, classed by Ehrenberg among living animalcules, are in reality vegetable; which, if true, shews that a good deal of microscopical work will have to be done over again. The Syro-Egyptian Society, too, have heard something relating to the same subject—a paper on Ehrenberg's examination by the microscope of the anciently deposited alluvium of the Nile, from which it appears that 'microscopic animals' in countless numbers were the cause of the remarkable fertility of the soil, and not vegetable or unctuous matters. Talking of deposits reminds me of a little fact which I must not forget to mention—the finding of a fossil reptile in the 'Old Red' of your county of Moray is, barring the alarm, as much a cause of astonishment to our geologists, as was the mark of the foot on the sand to Robinson Crusoe.

Now for a few gatherings from the continent. M. Chalmel has laid before the Académie at Paris a 'Note on a Modification to be introduced in the Preparation of Butter, which improves its Quality and prolongs its Preservation.' 'If butter,' he observes, 'contained only the fat parts of milk, it would undergo only very slow alterations when in contact with the air; but it retains a certain quantity of *caseum*, found in the cream, which *caseum*, by its fermentation, produces butyric-acid, and to which is owing the disagreeable flavour of rancid butter. The usual washing of butter rids it but very imperfectly of this cause of alteration, for the water does not wet the butter, and cannot dissolve the *caseum*, which has become insoluble under the influence of the acids that develop themselves in the cream. A more complete separation would be obtained if these acids were saturated; the *caseum* would again be soluble, and consequently the quantity retained in the butter would be almost entirely carried away by the washing-water.'

The remedy proposed is: 'When the cream is in the churn, pour in—a little at a time, and keep stirring—enough of lime-wash to destroy the acidity entirely. The cream is then to be churned until the butter separates; but before it forms into lumps, the butter-

milk is to be poured off, and replaced by cold water, in which the churning is to be continued until the butter is complete, when it is to be taken from the churn and treated as usual. I have,' says M. Chalambel, 'by following this method, obtained butter always better, and which kept longer, than when made in the ordinary way. The buttermilk, deprived of its sharp taste, was drunk with pleasure by men and animals, and had lost its laxative properties.' By means of lime-wash or lime-water, he has restored butter so 'far gone' that it could only have been recovered by melting; but any alkaline lixivium will answer the same purpose.

I have more than once kept you informed of the inquiry concerning the effects of iodine on the human system, which has so long engaged the attention of several eminent chemists on the continent; and now have to report something further by M. Fourcault, whose communication thereupon to the Académie is entitled, 'On the Absence of Iodine in Water and Alimentary Substances, considered as Cause of Goitre and Crétinism, and on the Means of Preventing the Development of these Affections.' He has investigated the subject profoundly and analytically, and concludes that 'the absence or insufficiency of iodine in water and in alimentary substances, is to be considered as the primitive cause, special or *sui generis*, of goitre and crétinism;' that the existence of the diseases does not depend on the presence more or less of sulphate of lime or magnesia in the animal economy; that 'iodine acts in goitre as iron in chlorosis—by restoring to the system one of its essential principles;' and that 'the most powerful secondary or auxiliary causes are: a coarse and uniform vegetable regimen; living at the bottom of deep, enclosed valleys; in low and damp houses, into which air and light penetrate with difficulty; the alliance of infected families among themselves; and the want of such employment as would yield a comfortable subsistence and proper development of the physical forces.' In commenting on these statements, Baron Thénard observed that M. Chatain, in the course of his able researches on iodine, had analysed the waters of those Alpine valleys most subject to goitre, and found that mineral almost entirely wanting. And it has been proved that sea-salt, containing a minute quantity of ioduret of potassium, acted as a preservative from goitre on all the inhabitants of a district who made use of it. The air, too, has been examined as well as the water, and, so far as yet ascertained, the proportion of iodine in the atmosphere is variable, and much greater in amount in some regions than in others. The activity prevailing in this particular branch of inquiry is the more encouraging, as the maladies which it aims at removing are of so peculiarly distressing a nature; and the investigation is one likely to lead also to valuable incidental results.

Next, M. Abeille, chief physician to the hospital at Ajaccio, has an interesting communication—On the employment of electricity to counteract the accidents arising from too long inhalation of ether or chloroform. He found that patients submitted to galvanic-puncture could not be rendered insensible by the effects of ether—the galvanism invariably restored sensation—and taking this accidentally-discovered fact as the basis of further research, he set to work and made a series of experiments on living animals, and arrived at results which in a brief summary are: that electricity, made to operate by means of needles implanted in several parts of the body, especially in the direction of the cerebro-spinal axis, reawakes sensibility, and immediately puts the relaxed muscles into play. 'It constitutes,' he adds, 'according to my experiments, the most prompt and efficacious means—I may say the only efficacious—to restore to life any person whose inhalation of chloroform has been prolonged beyond the time prescribed by prudence. It is the first means to which recourse ought to be had; and trials made in

other ways appeared to me to lead to nothing but loss of time, which in many cases would be fatal.'

M. H. Deschamps says, that there is a 'certain sign of death,' which, if attended to, will entirely prevent risk of that much-dreaded accident—premature interment. It is a certain green tinge which always makes its appearance on the abdomen, even before the cadaverous smell, and is a positive evidence that decomposition has begun. There are some people to whom the knowledge of this fact will be a satisfaction; but if, as is popularly supposed, bodies are not unfrequently buried alive, how is it that we never hear of a revival in a dissecting-room? Then, on another point of physiology, M. Payerne states, with regard to the distress experienced by many persons in the ascent of a high mountain, 'that the lassitude and breathlessness felt in elevated places appear to proceed, not from an insufficiency of oxygen, but rather from the rupture of the equilibrium between the tension of the fluids contained in our organs and that of the ambient air, whatever be the way in which the rupture is produced.' And, to close these physiological matters, M. Chuart begs the Académie to include among their premiums for rendering arts or trades less insalubrious, one for 'different inventions designed to diminish the frequency of accidents which take place in coal-mines from explosions of gas.' How much such inventions are needed, recent events in our own coal districts but too painfully demonstrate.

Our Meteorological Society may perhaps take a hint from M. Liais's suggestion as to the 'possibility of applying photography to determine the height of clouds, and to the observation of shooting-stars;' and M. F. Caillaud, director of the museum at Nantes, says something not uninteresting to naturalists—namely, that the statements commonly made, that all molluscous animals perforate stone by means of an acid, is not the fact with regard to *Pholades* and *Tarets*. He observes, that although a workman would be amazed on hearing a proposition to pierce calcareous stone with the shell of a *Pholas*, yet he himself has done it, and holds the success to be a proof that the animal can do the same. The idea of the acid might be accepted, while it was proved that the creatures were to be found only in limestone; but now that he has sent to the Académie specimens of gneiss and mica schist, containing pholades, on which the acid has no effect, he conceives that they must have entered by boring. They have also been found in porphyry—a fact of which Brongniart said, many years ago, that nature had concealed the explanation, and we must wait for a solution. Whether M. Caillaud's solution be the true one or not, is a point that will soon be verified or disproved by geologists and naturalists, who are never better pleased than when an inquiry, which may lead to new views of nature, opens before them.

That the age of great books is not past, is proved by an arrival from America—the United States' government having presented to several public and private institutions in this country, a large, handsome quarto, which contains, to quote the whole title, *Historical and Statistical Information respecting the History, Condition, and Prospects of the Indian Tribes of the United States, collected and prepared under the Direction of the Bureau of Indian Affairs, per Act of Congress*. The preparation and arrangement of this work having been intrusted to Mr Schoolcraft is a sufficient guarantee for its value. It throws much light on the Indian tribes of North America, and rectifies many erroneous ideas and impressions concerning them and their origin. Perhaps you will allow me to give you, in a few words, the author's views on this part of the subject. He considers the ancient monuments, found in parts of the United States and in Mexico, to have originated within five hundred years of the dispersion from Babel; that the Indians are the Almgic branch of the Eberites;

and that the ancient monuments do not denote so high a degree of civilisation as is generally supposed. It is only since the discovery of America by Europeans that anything like certainty attaches to the history of the natives. The Mohicans 'preserve the memory of the appearance and voyage of Hudson, up the river bearing his name, in 1609;' and among other tribes similar traditions are retained. In the wrong-headedness and persistence of idea, the Indians entirely resemble the Oriental branches of the great Semitic family; and the evidence shews that originally they crossed over from Asia at Behring's Strait, a voyage still performed in canoes to the present day. One of the titles of Montezuma was Lord of the Seven Caves; and the caves in which tradition says the traverse took place, are taken to be the caves or subterranean abodes still used by the Aleutian islanders. This was current among the Aztecs in 1519, and the voyage of the United States' Exploring Expedition has furnished a philological proof of connection, in the peculiar termination of nouns in *tl*, which is common to the inhabitants of Nootka Sound, as it was to the Aztecs. The more the Indians are studied, the more does everything about them appear to be Eastern—their language, religion, calendar, architecture, &c. Their worship of fire in the open air, avoiding the use of temples, is precisely that of Zoroaster, as is also their leading doctrine of two spirits—good and evil—ruling the world; and the allegory of the egg of *Ormuzd* has been found in an earthwork on the top of a hill in Adams's County, Ohio. 'It represents the coil of a serpent, 700 feet long, but it is thought would reach, if deprived of its curves, 1000 feet. The jaws of the serpent are represented as widely distended, as if in the act of swallowing. In the interstice is an oval or egg-shaped mound.' This repetition of a symbol is considered as further proof of Eastern derivation.

Do not suppose, however, that this is a sample of the whole volume, for ample details and information are given on all matters connected with the Indians—their arts, habits, pursuits, pictorial literature (so to speak), sports, and agriculture. Some idea of their capabilities in husbandry may be gathered from the fact, that in Michigan, ancient 'garden-beds' have been discovered, extending for 150 miles along the banks of rivers. Students will find a mine of information in this book, which, though but the first of a series, contains nearly 600 pages—a rare feast for ethnologists.

The Royal Irish Academy in Dublin have published a report of their proceedings, which comprise reports on rain-falls, meteors, ancient urns, and other Irish antiquities, besides Roman and Carthaginian; on hygrometry, chiefly with regard to the pressure of the dew-point; and on artificial islands. Of the latter, it appears that several exist in different parts of Ireland; but the one to which attention is particularly directed is near Strokestown, Roscommon. The lake Clonfinlough having been drained by the Board of Works, the structure of the islet, which had long occupied its centre, was laid bare. It proved to be about 130 feet in diameter, constructed on oak piles, forming a sort of 'triple stockade,' with stems laid flat towards the centre for a floor, over which earth, clay, and marl were heaped, with two flat irregular stone-floors covering the whole at different depths below the surface. Two canoes were also found, each hollowed out of a single tree, and a great collection of miscellaneous ornaments and domestic utensils—all of which being illustrative of different periods of Irish history, will receive due attention at the hands of Irish antiquaries. Visitors to the Society's Museum will be gratified to know that Mr Petrie is preparing a catalogue of that valuable and interesting assemblage of rarities. He is to begin with the Stone Period, and come down to the Bronze and Iron, according to their respective dates, with dissertations prefixed. This is following

the good example set by your Scottish Society of Antiquaries.

It is a fact honourable to the society that they do not confine their honours exclusively to contributors to their own 'Transactions.' At their late anniversary, they gave their gold medal to the Rev. J. H. Jellett, for his labours in treating the noblest mathematical subjects in a way to make them intelligible to students. As the president said in his address: 'Descending from the more desirable position of an inventor to the humbler but more useful one of enabling others to place themselves on a level with himself, by compiling for their use an excellent elementary treatise, he has conferred on his species a benefit of the highest order,' in a work which otherwise was 'as little likely to be given to the world as it was desirable that it should be so.'

It is time to close; but I must first clear off a few miscellaneous items. The Admiralty Report concerning the Arctic expeditions is canvassed pretty freely, and with significant hints that justice has not been rendered in its conclusions. We can only hope that really efficient commanders will be sent out with the expedition that is to be despatched in April or May next; if not, it will be abortive, as the others have been, and we shall never know what has become of Franklin. It appears that the news of Collinson's ships being on their return is unfounded. It was communicated from the United States, and has been contradicted; and for all we know to the contrary, Collinson and his coadjutor Maclure may come home next summer by way of Baffin's Bay. There are now 226 telegraph stations connected with the central establishment in Lothbury, behind the Bank of England. Of these, 70 are principal stations, at which the attendance is day and night; and in the whole, a distance of 2500 miles is embraced, with 800 more over which the wires are now being stretched. The charges for transmission of messages have been lowered with a beneficial result, the business of the telegraph having greatly increased. There must be a still further reduction before the 'thought-flasher' becomes as generally available here as it is in America. It is now in real earnest going to Ireland. A ship has been despatched to fetch Cleopatra's so-called 'needle,' the Panopticon at length has found a local habitation, and is assuming a tangible form in the shape of bricks and mortar: ocean steamers are more than ever talked about; and every month a new one, better than all before, is launched: gold, too, is a favourite topic; and Australian and Californian mining-shares are plentiful in the market; so also are those of Irish Waste-Land Improvement Companies, who, in addition to the reclamation, propose to grow beet-root, flax, and chicory. At last we have got one or two penny news-rooms—not so good, however, as yours in Edinburgh; and a project is mooted to establish reading and waiting rooms combined, in different parts of the capital. There is talk, too, of central railway termini, of new bridges, new streets, and of converting Kennington Common into a park—how soon to be realised remains to be seen.

THE TURN OF LIFE.

From forty to sixty, a man who has properly regulated himself, may be considered as in the prime of life. His matured strength of constitution renders him almost impervious to the attacks of disease, and experience has given him judgment the soundness of almost infallibility. His mind is resolute, firm, and equal; all his functions are in the highest order; he assumes the mastery over business; builds up a competence on the foundation he has formed in early manhood, and passes through a period of life attended by many gratifications. Having gone a year or two past sixty, he arrives at a critical period in the road of existence; the river of death flows before him, and he remains at a stand-still. But athwart

this river is a viaduct, called 'The turn of Life,' which, if crossed in safety, leads to the valley, 'Old Age.' The bridge is constructed of fragile materials, and it depends upon how it is trodden whether it bend or break. Gout, apoplexy, and other bad characters are also in the vicinity to waylay the traveller, and thrust him from the pass; but let him gird up his loins, and provide himself with a sitting staff, and he may trudge on in safety with perfect composure. To quit a metaphor, the 'Turn of Life' is a turn either into a prolonged walk or into the grave. The system and power having reached their utmost expansion, now begin either to close like flowers at sunset, or break down at once. One injudicious stimulant—a single fatal excitement, may force it beyond its strength—whilst a careful supply of props, and the withdrawal of all that tends to force a plant, will sustain it in beauty and in vigour until night has entirely set.—*The Science of Life, by a Physician.*

NERVE.

An Indian sword-player declared at a great public festival, that he could cleave, vertically, a small lime laid on a man's palm without injury to the member; and the general (Sir Charles Napier) extended his right hand for the trial. The sword-player, awed by his rank, was reluctant, and cut the fruit horizontally. Being urged to fulfil his boast, he examined the palm, said it was not one to be experimented on with safety, and refused to proceed. The general then extended his left hand, which was admitted to be suitable in form; yet the Indian still declined the trial; and when pressed, twice waved his thin, keen-edged blade, as if to strike, and twice withheld the blow, declaring he was uncertain of success. Finally, he was forced to make trial, and the lime fell open, cleanly divided: the edge of the sword had just marked its passage over the skin without drawing a drop of blood!—*Sir Charles Napier's Administration in Scinde.*

WIRE USED IN EMBROIDERY.

In the manufacture of embroidery fine threads of silver gilt are used. To produce these, a bar of silver, weighing 180 ounces, is gilt with an ounce of gold; this bar is then wire-drawn until it is reduced to a thread so fine that 3400 feet of it weigh less than an ounce. It is then flattened by being submitted to a severe pressure between rollers, in which process its length is increased to 4000 feet. Each foot of the flattened wire weighs, therefore, the 4000th part of an ounce. But as in the processes of wire-drawing and rolling the proportion of the two metals is maintained, the gold which covers the surface of the fine thread thus produced consists only of the 180th part of its whole weight. Therefore the gold which covers one foot is only the 720,000th part of an ounce, and consequently the gold which covers an inch will be the 8,640,000th part of an ounce. If this inch be again divided into 100 equal parts, each part will be distinctly visible without the aid of a microscope, and yet the gold which covers such visible part will be only the 864,000,000th part of an ounce. But we need not stop even here. This portion of the wire may be viewed through a microscope which magnifies 500 times; and by these means, therefore, its 500th part will become visible.—*Lardner's Handbook.*

CHEAP LIVING.

In the interior of Bulgaria and Upper Moesia, the low price of provision and cattle of every description is almost fabulous compared with the prices of Western Europe. A fat sheep or lamb usually costs from 1s. 6d. to 2s.; an ox, 40s.; cows, 30s.; and a horse, in the best possible travelling condition, from L.4 to L.5 sterling; wool, hides, tallow, wax, and honey, are equally low. In the towns and hans by the road-side everything is sold by weight: you can get a pound of meat for a halfpenny, a pound of bread for the same, and wine, which is also sold by weight, costs about the same money. In Servia, pigs everywhere form the staple commodity of the country. I have seen some that would weigh from 150 lbs. to 200 lbs. or more offered for sale at 300 Turkish piastres the dozen; in the neighbourhood of the Danube they

fetch a little more. The expense of keeping these animals in a country abounding with forests being so trifling, and the prospect of gain to the proprietor so certain, we cannot wonder that no landowner is without them, and that they constitute the richest class in the principality. In fact, pig-jobbers are here men of the highest rank: the prince, his ministers, civil and military governors, are all engaged in this lucrative traffic.—*Spencer's Travels.*

MOUNTAINS IN SNOW.

COLD—oh, deathly cold—and silent, lie the white hills
'neath the sky,
Like a soul whom fate has covered with thy snows,
Adversity!
Not a sigh of wind comes moaning; the same outline,
high and bare,
As in pleasant days of summer, rises in the murky air.
Very quiet—very silent—whether shines the mocking sun
Through the wintry blue, or lowering drift the feathery
snow-clouds dun:
Always quiet, always silent, be it night or be it day,
With that pale shroud coldly lying where the heather-
blossoms lay.
Can they be the very mountains that we looked at, you
and I!
One long wavy line of purple painted on the sunset sky;
With the new moon's edge just touching that dark rim,
like dancer's foot,
Or young Dian's, on the hill-side for Endymion waiting
mute.
O how golden was that even!—O how balm the summer
air!
How the bridegroom sky bent loving o'er its earth so
virgin fair!
How the earth looked up to heaven like a bride with joy
oppressed,
In her thankfulness half-weeping that she was thus over-
blest!
Ghostly mountains! 'Silence—silence!' now is aye your
soundless voice,
Lifted in an awful patience o'er the world's uproarious
noise;
O'er its jarrings and its greetings—o'er its loving and its
hate—
'Silence! Bare thy brows all dumbly to the snows of
heaven, and—wait!'

UP THE INDUS.

THREE years ago, I received orders to proceed from Kuráchee to Roree by the river route, for the purpose of joining the siege-train then assembling for the reduction of Mooltan. Subsequent events caused my final destination to be changed to Sukkur. Although my journey was thus not so long as I had both expected and wished, yet I had an opportunity of seeing some three or four hundred miles of a river that the records of the past, and the anticipations of the future, alike combine to render interesting, and which in itself differs in many respects from the other rivers of India. My position in life—that of a non-commissioned officer of the ordnance department—has prevented me from gleanings information on the subject, either from books or official sources; but it may be that a narration of what I merely *saw*, will not prove altogether without interest for those who must run while they read—who have neither time, nor perhaps inclination, to acquire any more than a superficial knowledge of distant countries.

Having been provided with a passage in one of the steamers of the Indus flotilla, and informed that the vessel was to start at daybreak on the following morning, I hastened to procure the necessary documents to authorise my obtaining ten days' sea-rations from the commissariat department. The following was the proportion of food for each day, and I may remark, that I received it from government gratis, with the exception of the spirits, as I was proceeding on field-service:—1 lb. of biscuits, 1 lb. of salt beef or pork, 1-4th of 1 lb. of rice, 1 oz. and 2-7ths of sugar, 5-7ths of 1 oz. of tea, and 2 drams, or about 1-4th of a bottle of arrack, 24 degrees under proof. Having secured the provant, my mind was now perfectly at ease, and I leisurely set about completing my arrangements for the voyage. These consisted mainly in locking my only box, and tying up in a cotton quilt a blanket and the thick sheet of goat's-hair-felt that served me for a bed. It was dark before I left camp; and as I was detained a considerable time at the *bunder* or landing-place, waiting for a boat to take me off to the steamer, it was late in the night when I got on board.

The steamboat was about the size of the largest of those that ply above bridge on the Thames. When I had scrambled on deck, I found that the forepart of the vessel was crowded with the bodies of natives, every one of whom was testifying the soundness of his repose by notes both loud and deep. Having selected the only spot where there was room even to sit down, I began, in a somewhat high key, to warble a lively strain calculated to cheer the drooping spirits of such of my neigh-

bours as had that evening undergone the pang of parting from their friends. This proceeding soon had the effect of drawing all eyes upon me, and, indeed, not a few of the tongues also; for the now thoroughly awakened sleepers—with great want of taste—growled out, at the expense both of myself and of my performance, sundry maledictions, with a fervency peculiar to the country, until at length I may say I was clad with curses as with a garment. At this juncture, I took out of my provision-bag a remarkably fine piece of pork, and began to contemplate it by the light of the moon with the critical eye of a connoisseur. The reader is no doubt aware, that among the natives of India the popular prejudice does not run in favour of this wholesome article of food; and perhaps to this fact I must attribute it that the surrounding Mussulmans and Hindoos became wondrously polite all on a sudden, and left a wide circle vacant around me, so that I had ample room to make down my bed; nor was I disturbed from a hearty sleep till the morning.

At daybreak, I was aroused by the crew getting up the anchor: in a few minutes, the head of the 'fire-boat,' as my dusky neighbours termed it, was turned down the coast, and on we went, steaming, smoking, and splashing, after the most orthodox fashion of fire-boats in general. I had now time and opportunity to look around me. Every available spot of the deck and paddle-boxes of the small, flat-bottomed iron steamer, was crowded with as motley a set of passengers as ever sailed since the days of Captain Noah. Sepoys returning from furlough to join their regiments; lascars, or enlisted workmen belonging to the different civil branches of the army; and camp-followers in all their varieties, were everywhere squatted on their haunches, and although muffled up to their eyes in wrappers of cotton-cloth, were all looking miserably cold from the sharpness of the morning breeze. The crew consisted of about twenty sailors—half of whom were Europeans, and evidently picked hands. Under the influence of good pay, fresh provisions without stint, sleeping all night in their hammocks, and constant change of scene, they were as healthy-looking and good-humoured a lot of seamen as I had ever met with. Their principal employment seemed to be to take their turn at the wheel; and as the natives performed most of the little work that was to be done in a vessel of this description, carrying no sails, I presume they were entertained only with the view of manning the two small howitzers and half-a-dozen swivel-guns, in case our little craft should find it necessary to shew her teeth. The remaining portion of the men were even finer specimens of humanity than the Europeans. With the exception of two tall, bony

Scindians, they were all Seedies, or negroes, and there was not one among them that might not have served as a model for a Hercules. Their huge bodies presented an appearance of massiveness and immense strength; and the enormous muscles had even more than the prominence we find in some statues, but so seldom meet with in men of these effeminate times. These particulars were the more easily noted, as their style of costume, in the daytime at least, approached very closely to nudity. But their size was as nothing to their appetites; and deep and vast as their internal accommodations must have been, it remains a matter of perplexity to me to this day to determine by what mysterious process they managed to stow away one-half of what they devoured. I have repeatedly watched one of these overgrown animals seat himself before a wooden trencher, some three-quarters of a yard broad, and clear from it, as if by magic, a mess piled up to the greatest capacity of the vessel, and consisting of rice, garnished at the top with a couple of pounds or so of curried meat or fish; after which, glaring around him in a hungry and dissatisfied manner, calculated to raise unpleasant sensations in a nervous bystander, he would sullenly catch hold of the hookah common to the party, and seek to deaden his appetite by swallowing down long and repeated draughts of tobacco-smoke, until the tears came into his eyes, and he was forced to desist by a paroxysm of coughing.

Among the passengers, there were two or three persons of my own standing, and on the quarter-deck a small group of officers, one of whom was accompanied by his wife. The lady had certainly no reason to grumble at the inattention of her companions. The fair sex, although much more plentiful at the time I speak of than ten years ago, was still rather scarce in these parts, ladies being few and far between in the stations beyond Kuráchee. With a praiseworthy desire to make the most of the honour, the skipper was bustling about, giving all sorts of orders that might in any way conduce to the comfort of his fair passenger, and apparently in a state of mental agony when a momentary turn of the vessel would render the awning and screens ineffectual in preserving her from a chance ray of the sun. Two young subalterns were tumbling over one another in the anxious endeavour to be the first to bring a footstool; a couple of their seniors were standing by, rubbing their hands and smiling blandly, to keep their minds in a fit state for the perpetration of a compliment on the first possible occasion; while even the grim old major was trying very hard to unbend: not that it was a part of his principles to be particularly gallant to the ladies, but as he was going to a place where he might not have the advantage of seeing any of them for some years, and would thus run the chance of growing rusty, he thought he might as well keep his hand in while he had the opportunity.

After running down the coast till the sun became so uncomfortably hot as to render an awning over the whole vessel an indispensable necessity, we suddenly struck into one of the many creeks with which the Delta of the Indus is everywhere interlaced. The vessel did not answer her helm well; and as the breadth of the stream did not much exceed her length, we were for some time running ashore, first on one bank, and then on the opposite one. However, as the banks were steep, and composed of a mixture of sand and mud, we were not so much delayed by these accidents as might have been expected; for after grounding with a shock sufficient to floor any one unused to the navigation of the Indus, the tough little craft would slide back of her own accord into her proper element, and go ahead again as if nothing had happened. The first time this took place, I was sent on my beam-ends, and was not a little alarmed into the bargain; but the crew seemed to take it as a matter of course, and in reply to my anxious inquiries as to the extent of damage that had been

occasioned, they informed me that she had only brushed the cobwebs off her keel. On entering the creek, we startled large flocks of wild geese and ducks; and here and there a pair of pelicans, after gazing at us for a few seconds, would slowly wing their way to some more sequestered stream, unprofaned by noisy, smoky civilisation.

As we continued on our course, the landscape—a level plain, that stretched away for miles till it met the horizon—was covered with camels grazing upon tamarisk-bushes, which, with a few mangostans, an occasional specimen of acanthus, and a coarse and scanty herbage, were the only specimens of the vegetable kingdom that met our gaze. The scene during the remainder of the afternoon was the same, the monotony being relieved only when we stopped for half an hour to take a supply of wood from a large pile collected on the bank for this purpose, and thus had an opportunity of stretching our legs on *terra firma*. At dusk, the steam-boat was run ashore, the steam blown off, and here we were to remain for the night. The natives immediately rushed on shore, and began preparing fires to cook their provisions. The ship's cook had already supplied me with a cup, or rather a tin pot of tea; but as the growing coolness of the evening, and the example of my neighbours, rather encouraged my appetite, I resolved to make a second edition of my evening meal, and accordingly took under my arm the copper canteen which formed the sum-total of my culinary apparatus—the lid being my only plate or dish—and furnished with a supply of tea, sugar, cold meat, and biscuit, made my way to a spot a short distance off, where I might take my food on the solitary system, according to the custom that we Englishmen most delight in. When I had lighted the fire, and put the water on to boil, I cast myself on the ground, and complacently puffing away at my pipe, gazed at the wild but picturesque scene before me. The position of the river was marked out by a semi-circle of some fifty or sixty fires, before which dark and ill-defined figures were ever and anon flitting like phantoms; while, in the midst, the funnel of the steam-boat loomed tall and black above the veil of smoke that hung around—like some dark and horrid object of heathen idolatry surrounded by its sacrificial fires. The sounds that met my ear, however, dispelled this somewhat fanciful idea; for in the stillness of the night voices grow distinct, while forms are indebted to the imagination for filling up their outlines.

The native passengers, who had remained, silent and dull, in a constrained position during the whole of the day, felt a load taken off their spirits as soon as they set foot on dry land; and in a trice the silence that had hitherto reigned was broken by a very Babel of tongues, among which could be distinguished the guttural jargon of the Scindian, the bastard dialect of Mahratti, of the Hindoo from the Deccan, and the ungrammatical *patois* of Hindostani, which—although, when exclusively used, it marked out the Mussulman—was yet the *lingua franca* of the whole party; but amidst the unceasing torrent of words, little could be distinguished, save when the ear was saluted with an outburst of nature's universal and unvaried language in the shape of a light-hearted laugh. By and by, my attention became directed, by an occasional shout of merriment, to a group of Seedies clustered round a fire near me. Negroes in this country are much the same as in other parts of the world—a happy, easily-contented race, forgetful of the past, and careless of the future. After keeping up their noisy confabulation for some time, they removed to a level spot close to where I was lying: one of them squatted down on the ground, and commenced singing to the music of a sort of tambourine, that he beat with the flat of his hand; and the others at once formed a circle, and commenced a rude dance, which had probably been brought

by themselves or their fathers from the shores of Eastern Africa. The air was at first low and monotonous, the time seeming to be more studied than any variation of the tune; but after some minutes a few notes in a higher key were occasionally introduced, giving the music a strangely wild and melancholy character. The dance consisted principally of low jumps, each foot being alternately advanced in strict time with the music. Sometimes the dancers joined hands; again they would pass into one another's places, until they had made the circuit of the ring; and every now and then, in going through these movements, they would leap completely round, apparently without an effort, but as a natural consequence of the momentum produced by the celerity of their motions, and the weight of their huge bodies. The whole affair was gone through in a serious and business-like manner, unusual in the negro. How long I watched them I cannot say; but it seemed to me as if they went on for hours without slackening the pace, or moving one muscle of their countenances, and my eyes became heavy with looking at them. At length, the figures appeared to grow dim, and among them I thought I recognised faces of friends then many thousands of miles from me, and forms that the earth had long before covered over. A death-like chill came over me: by a sudden impulse, I rushed forward, and awoke. With bewildered feelings, I rose on my elbow, and gazed around. The moon had risen; her cold, clear light making every object near me either startlingly distinct, or else a mass of dark shade, while a deep and solemn silence reigned around. All had vanished—the singer and the dancers—the flaming, sparkling, roaring fires, and the noisy groups around them; and I might have imagined that I had awaked to find myself in another world, had it not been for the heap of black ashes beside me, and the dark outline of the steam-boat in the distance. I arose, stiff, cold, and bowy, and tucking my kitchen under my arm, slowly wended my way on board.

However, there must be an end to all things; and on the third day, we emerged from the dreary net-work of creeks, and entered into the open Indus. The scenery still remained much the same. Here and there, beacons were erected, but they were only of temporary use, for the channel of the river alters almost every year. The breadth of the stream varies with the rise of the water consequent on the melting of the snow on the distant mountains, among which it takes its source. At Sukkur, it is as broad as the Thames at Blackwall; and nearly two hundred miles lower down, it is sometimes found of no greater breadth; while in other spots it spreads into a lake some two or three miles across, depending upon the level of the surrounding country and the rise of the river. Scinde has been called Young Egypt, from the general resemblance of the physical features of the two countries, and the fact, that the existence of an only river in each is the sole cause of an immense tract of territory being prevented from becoming throughout a parched and unprofitable desert. In Upper Scinde, there are very rarely more than three or four showers in the year, and the cultivator has to depend entirely upon the overflow of the river for the growth of his crops, in the same way as the fellah of Egypt is saved from famine by the annual inundation of the Nile. In Fort Bukkur, there is a gauge on which the height of the river is registered, in a similar manner to that of the celebrated one in Egypt; and the news of the rise or fall of a few inches, is received by the Scindians with an eager interest, not a little strange to those who are unaware that such petty fluctuations determine whether a nation shall feast or starve for the next twelve months. It is pleasing to add, that there are hopes of a change for the better in this state of uncertainty of obtaining the necessities of life, which, in a case like this, where so little depends upon the energy of single members of the community,

acts as a sure check upon the progress of civilisation. Canals, excavated at a time when all India was one vast empire, but since choked up and fallen into ruins, have been cleaned and repaired, and new ones projected. A late order of government has led the way to the Indus being constituted, instead of the Ganges, the highway from Europe to the fertile and important provinces of North-Western Hindostan. Commerce, in the pride of her prosperity, grows nice about her roads, and she will soon take the Indus in hand, and put a stop to its little irregularities. Mere art, perhaps, could do but little to remove the impediments to the navigation of this immense river. This end could only be obtained by taking advantage of the natural causes which have made a deep channel in one part and a shoal but a few yards lower down. Dame Nature, like dames in general, may be easily led if we can only persuade her that she is acting of her own accord.

On we went, steaming, and smoking, and splashing more than ever, buffeting against the muddy-looking stream, which, however, was sometimes too much for us, so that we were fain to take advantage of the still waters or back-current near the banks. The river being low at this season, we ran aground, in spite of all the care of our Scindian pilot and the Seedie leadsman, often enough to have wrecked a moderately-sized navy. The leadsman was a rather pompous individual, duly impressed with the importance of his position, in having charge of the deep-sea line, which was something short of two fathoms in length. He was stationed at the bows, and ever and anon proclaimed aloud the depth of water in language that he fondly believed to be English. As we dashed along in one fathom water, he seemed perfectly at his ease, and drew the small lead from the river, and again tossed it before him with a studied grace, turning round occasionally, with an air of affected indifference, to read admiration in our eyes. As the water shoaled to four feet, his brow contracted and his motions were quickened; when it became three feet, he hurled the lead into the water, as the gambler dashes down his last dice; and at last, as we grazed on the tail of a bank, it was almost with a shriek that he yelled out, 'Doo foots!' But our hour had not yet come; and as the water deepened to beyond the four yards that formed the extent of his line, he assumed his former dignified ease, and leisurely made known that there was 'No bot-t-a-a-n!'—an announcement which, although gratifying in one respect, was yet somewhat startling.

But we did not always escape in this manner. Not to speak of minor mischances, on one occasion we stuck hard and fast for twenty-four hours, in spite of every attempt to extricate ourselves. Here was a predicament for the captain! He had received instructions to make the greatest speed on his trip; his passengers were all burning with impatience lest they should be too late to acquire glory and prize-money—the prize-money at all events; the military stores on board were urgently required at Mooltan; and, worse than all, the lady began to pout! This was the climax of his misfortune; and the skipper, growing desperate, swore a mighty oath that if the obstinate little craft would not swim through the water, she should walk over the land, and we should see who would get tired of it first. Accordingly, an anchor was carried forward to a spot some forty yards off, where the water was deeper; the greater part of the passengers were made to jump overboard, without even going through the formality of walking the plank; while the remainder manned the capstan-bars. The chain-cable tightened, the capstan creaked, and the paddles dashed round; but we did not stir an inch till the natives, who had been so unceremoniously turned overboard, began to apply the pressure from without, when, amidst shouts and yells, and curses in a dozen different languages, we slid along the surface of the bank until we reached a deeper channel.

The outside passengers then scrambled on board, and again we darted on; while the captain took snuff with the triumphant air of a man who was not to be trifled with, and informed the lady confidentially that she (the steam-boat) was not a bad little craft after all, but it did not do to let her have her own way altogether.

Let it now suffice to say, that the amphibious steam-boat carried us to Sukkur in rather less than three weeks—our voyage in some respects resembling the midnight journey of the demon horseman—

'Tramp, tramp across the land we ride;
'Splash, splash across the sea!'

Glad we were when a bend of the river shewed us the island and picturesque fort of Bukkur, apparently blocking up all further progress; the left bank being studded with the white bungalows of Sukkur, half-hidden in clumps of date-trees; while the right was clothed to the water's edge with the bright green foliage of the gardens of Roree.

HELPS'S ESSAYS.

In an age of many books, there must needs be some, highly worthy of attention, with which the general reading-public will be but imperfectly acquainted. Though probably known to many of our readers, we think it likely that the writings of Mr Helps are yet unknown to many others, who might profit by the study of them, and more or less appreciate their excellence. Under this conviction, it is proposed to notice them in the present pages; and we have little doubt of being able to substantiate their claims to consideration. To readers who require of a book something more than mere amusement, or a passing satisfaction to their curiosity; who have any regard or relish for independent thinking—for an enlarged observation of human life—for the results of study and experience—for practical sense and wisdom, and a general understanding and appreciation of the varied motives, ways, and interests of men and of society—these volumes cannot fail to prove delightful and profitable reading.

All Mr Helps's writings have been published anonymously; and it is only within the last two years that he has become known, out of his own circle, to be the author. His earliest publications were, *Essays written in the Intervals of Business*, and *An Essay on the Duties of the Employers to the Employed*, otherwise entitled *The Claims of Labour*. He has also published a work in two volumes under the title of *The Conquerors of the New World and their Bondsmen*; a historical narrative of the principal events which led to negro slavery in the West Indies and America. But the books from his pen with which we are best acquainted, and which have obtained the largest measure of public attention, are a series of essays intermixed with dialogues, called *Friends in Council*, and a supplementary volume, somewhat different in plan, which he calls *Companions of my Solitude*.* As the whole of his characteristics as an essayist are displayed with a more perfect effect in these two latter works than in the others, and as they will afford us as much extract as we shall have space for, we propose to confine our remarks to them exclusively. Matter enough, and even more than enough, will be found in them for illustrating whatever we may find to say respecting the author's powers and attainments.

The *Friends in Council* purports to be edited by a clergyman named Dunsford, who was so obliging and laborious as to set down the conversations in which he, Ellesmere (the great lawyer), and Milverton (the author), had engaged on various occasions, when the

last read to his companions a number of short essays which he was writing. We have a page or two of introduction, informing us of this circumstance, and of a few other particulars needful to be mentioned; and then, after a little talk among the friends, an essay is read, followed by the interlocutors' comments, and a discussion of its merits. These conversations form a very agreeable portion of the work, and exhibit a fine mastery of dialogue. They are exactly like the discourse of intelligent and accomplished men, and therefore very much unlike the ordinary run of book-reported talk. A few sentences may be not unfitly quoted, by way of exhibiting their quality. We take the following, on so common a matter as friendship; not because it is the best we might select, but because it seems one of the passages which is most readily extractable:—

'Ellesmere. I suppose all of us have, at one time or other, had a huge longing after friendship. If one could get it, it would be much safer than that other thing.

'Milverton. Well, I wonder whether love—for I imagine you mean love—was ever so described before, "that other thing!"

'Elles. When the world was younger, perhaps there was more of this friendship. David and Jonathan!—How does their friendship begin? I know it is very beautiful; but I have forgotten the words. Dunsford will tell us.

'Dunsford. "And Saul said to him, Whose son art thou, thou young man? And David answered, I am the son of thy servant Jesse the Bethlehemite. And it came to pass, when he had made an end of speaking unto Saul, that the soul of Jonathan was knit with the soul of David, and Jonathan loved him as his own soul."

'Elles. Now that men are more complex, they would require so much. For instance, if I were to have a friend, he must be an uncommunicative man: that limits me to about thirteen or fourteen people in the world. It is only with a man of perfect reticence that you can speak completely without reserve. We talk together far more openly than most people; but there is a skilful fencing even in our talk. We are not inclined to say the whole of what we think.

'Mil. What I should need in a friend would be a certain breadth of nature: I have no sympathy with people who can disturb themselves about small things; who crave the world's good opinion; are anxious to prove themselves always in the right; can be immersed in personal talk or devoted to self-advancement; who seem to have grown up entirely from the earth, whereas even the plants draw most of their sustenance from the air of heaven.

'Elles. That is a high flight. I am not prepared to say all that. I do not object to a little earthiness. What I should fear in friendship is the comment, and interference, and talebearing, I often see connected with it.

'Mil. That does not particularly belong to friendship, but comes under the general head of injudicious comment on the part of those who live with us. Divines often remind us, that in forming our ideas of the government of Providence, we should recollect that we see only a fragment. The same observation, in its degree, is true too as regards human conduct. We see a little bit here and there, and assume the nature of the whole. Even a very silly man's actions are often more to the purpose than his friend's comments upon them.

'Elles. True! Then I should not like to have a man for a friend who would bind me down to be consistent, who would form a minute theory of me which was not to be contradicted.

'Mil. If he loved you as his own soul, and his soul were knit with yours—to use the words of Scripture—he would not demand this consistency, because each man must know and feel his own immeasurable

* 1. *Friends in Council: a Series of Readings and Discourses thereon*. New Edition. Two vols. 2. *Companions of my Solitude*. Fiskering. London: 1851.

vacillation and inconsistency; and if he had complete sympathy with another, he would not be greatly surprised or vexed at that other's inconsistencies.

Duns. There always seems to me a want of tenderness in what are called friendships in the present day. Now, for instance, I don't understand a man ridiculing his friend. The joking of intimates often appears to me coarse and harsh. You will laugh at this in me, and think it rather effeminate, I am afraid.

Mil. No; I do not. I think a great deal of jocose railery may pass between intimates without the requisite tenderness being infringed upon. If my friend had been in a painful and ludicrous position (such as when Cardinal Balue in full dress is run away with on horseback, which Scott comments upon as one of a class of situations combining "pain, peril, and absurdity"), I should not remind him of it. Why should I bring back a disagreeable impression to his mind? Besides, it would be more painful than ludicrous to me. I should enter into his feelings rather than into those of the ordinary spectator.

Duns. I am glad we are of the same mind in this.

Mil. I have also a notion that, even in the common friendships of the world, we should be very stanch defenders of our absent friends. Supposing that our friend's character or conduct is justly attacked in our hearing upon some point, we should be careful to let the light and worth of the rest of his character in upon the company, so that they should go away with something of the impression that we have of him; instead of suffering them to dwell only upon this fault or foible that was commented upon, which was as nothing against him in our hearts—mere fringes to the character, which we were accustomed to, and rather liked than otherwise, if the truth must be told.

Elles. I declare we have made out amongst us an essay on friendship, without the fuss of writing one. I always told you our talk was better than your writing, Milverton. Now, we only want a beginning and ending to this peripatetic essay. What would you say to this as a beginning?—it is to be a stately, pompous plunge into the subject, after the Milverton fashion:—"Friendship and the Phoenix, taking into due account the fire-office of that name, have been found upon the earth in not unsimilar abundance." I flatter myself that "not unsimilar abundance" is eminently Milvertonian.

Mil. Now observe, Dunsford, you were speaking sometime ago about the joking of intimates being frequently unkind. This is just an instance to the contrary. Ellesmere, who is not a bad fellow—at least not so bad as he seems—knows that he can say anything he pleases about my style of writing without much annoying me. I am not very vulnerable on these points; but all the while there is a titillating pleasure to him in being all but impertinent and vexatious to a friend. And he enjoys that. So do I.

This certainly reads like free and natural conversation, besides being noteworthy for the suggestions it contains.

Mr Helps is strictly an original writer, in the sense of thinking for himself; but at the same time, one of his excellences consists in an adroit and novel use of commonplace. There is, indeed, as much originality in putting a new face upon old verities, as in producing new ones from the mint of one's invention. As Emerson has remarked, valuable originality does not consist in mere novelty or unlikeness to other men, but in range and extent of grasp and insight. This is a fact, too, which Mr Helps has noted. 'A suggestion,' says he, 'may be ever so old; but it is not exhausted until it is acted upon, or rejected on sufficient reason.' He has, therefore, no fastidious dread of saying anything which has been said before, but readily welcomes wise thoughts from all directions, often reproducing them with such felicity of expression, as to give them a new effect. Thus, in all the elements of a

profitable originality, he is rich and generous; and from few books of modern times could so large a store of aphorisms, fine sayings, and admirable observations be selected. We have marked a great many more than can be incorporated in the present paper; but some few may be, nevertheless, presented. Here, for instance, is a fine remark on time—next to love, the most hackneyed subject in the world:—"Men seldom feel as if they were bounded as to time: they think they can afford to throw away a great deal of that commodity; thus shewing unconsciously in their trifling the sense that they have of their immortality." On another familiar topic—human progress—he writes thus:—"The progress of mankind is like the incoming of the tide, which, from any given moment, is almost as much of a retreat as an advance, but still the tide moves on." Emerson has used the same figure, but in a passage which ought not to be regarded as impairing our author's originality.

On the vexed and perplexing question of *Evil*, Mr Helps has said many acute and consolatory things, from among which we have culled the following sentences:—"The man who is satisfied with any given state of things that we are likely to see on earth, must have a creeping imagination: on the other hand, he who is oppressed by the evils around him so as to stand gaping at them in horror, has a feeble will and a want of practical power, and allows his fancy to come in, like too much wavering light upon his work, so that he does not see to go on with it. A man of sagacity, while he apprehends a great deal of the evil around him, resolves what part of it he will be blind to for the present, in order to deal best with what he has in hand; and as to men of any genius, they are not imprisoned or rendered partial even by their own experience of evil, much less are their attacks upon it paralysed by their full consciousness of its large presence." Here, in the next place, is an aphorism worth pondering and remembrance:—"Vague injurious reports are no men's lies, but all men's carelessness." And by the side of it we may place a pleasant sarcasm attributed to Ellesmere, and apparently intended as a reminder for stump-orators: "How exactly proportioned to a man's ignorance of the subject is the noise he makes about it at a public meeting." Not altogether out of connection here may be this brief sentence:—"Next to the folly of doing a bad thing, is that of fearing to undo it." In the following, we have a brief sufficient argument against the indulgence of unavailing sorrow or anxiety:—"It has always appeared to me, that there is so much to be done in this world, that all self-inflicted suffering which cannot be turned to good account for others, is a loss—a loss, if you may so express it, to the spiritual world." There is plain truth, too, in the next, though it is not likely to be much remembered by those who are most in need of it:—"An ill-tempered man often has everything his own way, and seems very triumphant; but the demon he cherishes tears him as well as awes other people." In another place, and from another point of view, he indicates the admirable benefits of human sympathy. "Often," says he, "all that a man wants in order to accomplish something that is good for him to do, is the encouragement of another man's sympathy." What Bacon says the voice of the man is to the dog—the encouragement of a higher nature—each man can in a lesser degree afford his neighbour; for a man receives the suggestions of another mind with somewhat of the respect and courtesy with which he would greet a higher nature. Speaking with reference to the pursuits of men of literary and artistic genius, it is written: "Almost any worldly state in which a man can be placed is a hindrance to him, if he have other than mere worldly things to do. Poverty, wealth, many duties, or many affairs, distract and confuse him." One sentence more is all that can be added here; and if it seems to be suggested by an aphorism of Bacon, it is equal to it in pith and

penetration:—‘Every *felicity*, as well as wife and children, is a hostage to fortune.’

These sentences have been gathered chiefly from *Friends in Council*, though a few of them are taken from *Companions of my Solitude*. The two books are informed with the same spirit; and to a meditative person, one could not recommend a choicer store of reading. Those, however, to whom the works are as yet unknown, may wish to see some longer and more connected extract. It is difficult to decide upon what ought to be presented, where almost everything is exquisite; yet as a choice must be made, we will take some sentences from an essay on ‘Despair,’ wherein the writer offers a few remedial suggestions against the burden of remorse:—

‘To have erred in one branch of our duties, does not unfit us for the performance of all the rest, unless we suffer the dark spot to spread over our whole nature, which may happen almost unobserved in the torpor of despair. This kind of despair is chiefly grounded on a foolish belief, that individual words or actions constitute the whole life of man: whereas they are often not fair representatives of portions even of that life. The fragments of rock in a mountain stream may tell much of its history, are, in fact, results of its doings, but they are not the stream. They were brought down when it was turbid; it may now be clear: they are as much the result of other circumstances as of the action of the stream: their history is fitful: they give us no sure intelligence of the future course of the stream, or of the nature of its waters; and may scarcely shew more than that it has not been always as it is. The actions of men are often but little better indications of the men themselves. . . .

‘There is frequently much selfishness about remorse. Put what has been done at the worst. Let a man see his own evil word or deed in full light, and own it to be black as hell itself. He is still here. He cannot be isolated. There still remain for him cares and duties; and therefore hopes. Let him not in imagination link all creation to his fate. Let him yet live in the welfare of others, and, if it may be so, work out his own in this way; if not, be content with theirs. The saddest cause of remorseful despair is when a man does something expressly contrary to his character—when an honourable man, for instance, slides into some dishonourable action; or a tender-hearted man falls into cruelty from carelessness; or, as often happens, a sensitive nature continues to give the greatest pain to others from temper, feeling all the time perhaps more deeply than the persons aggrieved. All these cases may be summed up in the words, “That which I would not, that I do”—the saddest of all human confessions, made by one of the greatest men. However, the evil cannot be mended by despair. Hope and humility are the only supports under this burden.’

As our space presses, the passages we give must necessarily be short. The beauty of the few sentences following will not be disputed. They are taken from a ‘Chapter of Consolations’ in *Companions of my Solitude*, and will serve to exhibit our author’s style under one of its more animated aspects:—

‘Lastly, there is to be said of all suffering—that it is experience. I have forgotten in whose life it is to be found, but there is some man who went out of his way to provide himself with every form of human misery which he could get at. I do not myself see any occasion for any man’s going out of the way to provide misfortune for himself. Like an eminent physician, he might stay at home, and find almost every form of human misery knocking at his door. But still I understand what this chivalrous inquirer meant, who sought to taste all suffering for the sake of the experience it would give him.

‘There is this admirable commonplace, too, which, from long habit of being introduced in such discourses, wishes to come in before I conclude—namely, that

infortunities of various kinds belong to the state here below. Who are we that we should not take our share? See the slight amount of personal happiness requisite to go on with. In noisome dungeons, subject to studied tortures, in abject and shifty poverty, after consummate shame, upon tremendous change of fortune, in the profoundest desolation of mind and soul, in forced companionship with all that is unlovely and uncongenial—men, persevering nobly, live on, and live through all. The mind, like water, passes through all states, till it shall be united to what it is ever seeking. The very loneliness of man here is the greatest proof, to my mind, of a God.’

One of the things that strikes us most in these essays, is the author’s wise moderation of statement, his habit of looking at all phases of a question, and of saying something appropriate on each. We believe he makes Ellesmere observe somewhere, that moral essays commonly require another essay from the opposite point of view to temper and qualify their meaning. This requirement has been closely kept in mind. There is no undue vehemence, no straining of favourite points, no clap-trap rhetoric or elaborate phrase-makings; but everything is clear, judicious, well considered, and conscientiously set forth. The man does not write for the sake of writing, but because his soul is full of thoughts, and his remembrances charged with the wholesome lessons of experience. The thoughts generally are less remarkable for their depth than for their *breadth*—a free and unembarrassed all-sidedness, which is, perhaps, one of the most difficult of all attainments in the way of writing. There is a mild meditative wisdom in his utterances which can have been derived only through a large acquaintance with life and society; with the manifold diversities of motive and aspiration by which men are actuated; with everything, in short, that interests, degrades, or elevates humanity. Only from an extensive quarry of experience could this strong and graceful pillar of wit, sagacity, and judgment, have been built up. From this, too, has been acquired that broad liberality of opinion which must be welcome to every candid mind—the enlarged tolerance, and generous appreciation of all degrees of difference in men’s ways of thinking and of acting, which is one of the most pleasing and most distinctive characteristics of these writings. Often, in reading, we are inclined to say, here is one of the best-balanced souls in England—a finely-gifted and highly-cultivated man, to whom the pains and difficulties, the joys, the sorrows, the ambitions, and shortcomings of his race, are all familiar; who has felt them all, seen the good and evil of them all, and, with a calm deliberation, can testify at last, that the great Power of the Universe has so constrained and ordered the uncertainties and perils of our lot, as not only to reconcile all its apparent contradictions with the ends of moral discipline and benefit, but to make even the darkness of calamity flash rays of brightness and of hope. Thus, along with an enlarged knowledge of men and things, he gives us the wisest counsel about our conduct and proceedings in the world, and also the most encouraging conclusions with regard to our final destiny and prospects.

One word, in conclusion, about the writer’s style. It is not a monotonous style: it has an exquisite elasticity and modulation, fitting it for the expression of a great variety of moods, both in feeling and reflection. Though eminently refined, it is not over-dignified or stately. Idiomatically, rhythmic, graceful, aphoristic—full of sharp and fascinating turns of imagery—condensed expressions—a full, rounded meaning, gathered into the briefest compass. The severest judgment reigns throughout in the choice of words and epithets. There is nothing stale, no used-up similes or phrases, but everywhere the freest novelty and vigour. However hackneyed may be the subject, the manner of treatment is never hackneyed. His felicities of phraseology are

endless, and not to be sufficiently commended. It is a thoroughly original style, in the sense of being a correct representation of the author's cast of intellect and character. Moreover, it seems to us to be the true style of a gentleman—not one of the 'mob of gentlemen that write with ease'—but of an extensively informed, sincere, cultivated man of the world; using the term 'world,' not as signifying 'worldly,' but in its widest and most authentic meaning—as of one who knows and understands the world. In purity of diction, clearness, ease, pith, brightness, and variety, it is well-nigh as perfect as any style can be. Shrewder critics than ourselves might possibly detect 'faults' in it, but, for our part, we have as yet been unable to discover any which it would not be sheer trifling to mention.

JELLY-FISHES.

We inscribe at the head of this paper the popular name of a class of beings, which, though simple in their organisation, are full of interest to the zoologist, and attractive to the common observer from the singularity or beauty of their forms, and, in many cases, the brilliancy of their colouring. The ocean, throughout its wide extent, swarms with myriads of gelatinous creatures—some microscopic, some of large dimensions—which deck it with the gayest colours by day, and at night light up its dreary waste with 'mimic fires,' and make it glow and sparkle as if, like the heavens, it had its galaxies and constellations. These are the jelly-fishes, or sea-nettles (*Acalepha*), as they are often called, from the stinging properties with which some of them are endowed. The commoner forms are well known, for the beach is often strewn with the carcasses of the larger species. On fine days in summer and autumn, whole fleets of these strange voyagers appear off our coasts. Their umbrella-shaped, transparent disks float gracefully through the calm water, and their long fishing-lines trail after them as they move onward. At times, multitudes, almost invisible to the naked eye, tenant every wave, and give it by night a crest of flame; while other kinds measure as much as a yard in diameter. The *Acalepha* present the greatest variety of form and colour, as well as of size, but they are all of the most delicate structure, frail, gelatinous, transparent. Some are so perfectly colourless, that their presence can with difficulty be detected in the water.

The following description, by Professor E. Forbes, applies to a large proportion of the species:—"They are active in their habits, graceful in their motions, gay in their colouring, delicate as the finest membrane, transparent as the purest crystal." The poet Crabbe has characterised them well in the following passage:—

'Those living jellies which the flesh inflame,
Fierce as a nettle, and from that the name;
Some in huge masses, some that you might bring
In the small compass of a lady's ring;
Figured by hand divine—there's not a gem
Wrought by man's art to be compared to them;
Soft, brilliant, tender, through the wave they glow,
And make the moonbeam brighter where they flow.'

The first thing that arrests our attention in these creatures is the extreme delicacy and tenuity of their substance. The jelly-fish is chiefly made up of fluid. A quantity of water and a thin membranaceous film, these are its chief component parts. Professor Owen has ascertained that a large individual, weighing two pounds, when removed from the sea, will be represented, when the fluid which it contains is drained off, 'by a thin film of membrane not exceeding thirty grains in weight.' Naturalists have commonly described the jelly-fish as being little more than 'coagulated water,' and the description is correct.

And yet these masses of film and fluid, floating at the mercy of wind and wave, possess powers which we

should hardly associate with so simple a structure, and can accomplish works of which we should little suspect them. Delicate and defenceless as they appear, they can capture fishes of large size, and digest them with ease and rapidity. Some of them are in truth formidable monsters. Professor E. Forbes gives the following humorous description of the destructive propensities of some medusæ which he had captured in the Zetland seas:—"Being kept," he says, "in a jar of salt-water with small crustacea, they devoured these animals, so much more highly organised than themselves, voraciously; apparently enjoying the destruction of the unfortunate members of the upper classes with a truly democratic relish. One of them even attacked and commenced the swallowing of a *Liszia octopunctata*, quite as good a medusa as itself. An animal which can put out its mouth twice the length of its body, and stretch its stomach to corresponding dimensions, must indeed be "a triton among the minnows;" and a very terrific one too. Yet is this ferocious creature one of the most delicate and graceful of the inhabitants of the ocean—a very model of tenderness and elegance.'

The jelly-fishes are all, in their adult state, locomotive beings. They float freely and incessantly through the ocean, either impelled by their own efforts, or driven by storm and billow. They for the most part frequent the open seas, and shun the shore, their delicate frames being endangered by the perennial strife between land and water. Being designed for constant motion, for the navigation of the great waters, their entire organisation is adapted to such a mode of life. We find amongst those ocean-floaters the greatest perfection and variety of locomotive apparatus; and they have been divided into sections, according to the modifications of this portion of structure which they exhibit. We shall endeavour to give a popular account of the leading peculiarities of each, and note the most interesting points in the history of the tribe.

In the first section, the animals are furnished with a disk or umbrella of varying shape, which serves as a float, beneath which hang certain processes connected with the functions of prehension and digestion. In this division are included some of the best-known forms. The creature, in this case, propels itself by the alternate contraction and expansion of its disk, thus striking the water, and driving itself forward. These movements take place at regular intervals, and serve a double purpose. They not only propel, but at the same time drive the water over the lower surface of the disk. Here is situated a complicated net-work of vessels, and the fluids of the body are thus exposed to the influence of oxygen, and receive the needed aëration. The stroke of the disk, therefore, is not only a locomotive, but also a respiratory act. The jelly-fishes of this section move as they breathe, and breathe as they move. Hence the name which has been given them—*Pulmonigrades*. We find the same admirable economy of resources amongst the lower animalcules. The cilia which propel them secure the aëration of the system.

It is evident that the motive apparatus in this section of the *Acalepha* is but a feeble one. It only avails in calm weather. When the sea is agitated, the jelly-fish is driven helplessly along. It cannot choose its path. As its food, however, is everywhere abundant around it, and it has no business that should lead it in one direction more than another, there is no great hardship in this.

In this section are included some of the most beautiful, as well as common of the tribe. The forms of the umbrella are often most lovely, and present an astonishing variety. As an example of the beauty which they sometimes display, we may refer to a species which resembles an exquisitely formed glass-shade, ornamented with a waved and tinted fringe.

The most perfect grace of form, the transparency of the crystal, and colour as delicate as that of the flower, combine to render this frail being one of the loveliest of living things.

In another section, locomotion is effected by a modification of ciliary apparatus. We have a familiar example in the *Beroe* of our own seas, a most attractive little being, and a prime favourite with naturalists, who have described its habits and celebrated its beauty with enthusiasm. We shall not soon forget the delight with which we first made acquaintance with this graceful little rover. While rambling along the shore in quest of marine animals, our attention was arrested by a drop of the clearest jelly, as it seemed to be, lying on a mass of rock, from which the tide had but just receded. On transferring it to a phial of sea-water, its true nature was at once revealed to us. A globular body floated gracefully in the vessel, scarcely less transparent than the fluid which filled it. Presently it began to move up and down within its prison-house, and the paddles by means of which the *beroe* dances along its ocean-path were distinctly visible. These paddles are nothing more or less than cilia of a peculiar kind, ranged in eight bands upon the surface of the body. They are set in motion at the will of the animal, and their incessant strokes propel it swiftly through the water. By stopping some of its paddles, and keeping others in play, the *beroe* can change its course at pleasure, and so wander 'at its own sweet will,' through the trackless waste. Beauty waits upon the course of this little crystal globe. The grace and sprightliness of its movements must strike the commonest observer. As the sunlight falls upon its cilia, they are 'tinted with the most lovely iridescent colours;' and at night they flash forth phosphoric light, as though the little creature were giving a saucy challenge to the stars.

The *beroe* is a most active being, its habits conforming to the organisation with which it is endowed. Such an array of paddles prophesies of a mercurial temperament and an energetic character. It can, however, anchor itself and lie by when occasion offers. It is provided with two long cables, prettily set with spiral filaments or tendrils, by means of which it can make fast to any point. When not in use, it can retract them, and stow them away in two sacs or pouches within the body, where they may be seen coiled up, through the transparent walls. The mouth is a simple opening at one pole of the globular body. No arms are needed. The *beroe* is spared the labour and uncertainty of the chase. As it dances gaily along, streams of water, bearing nutritive particles, pass through the orifice into its stomach.

In this creature, as in many of the lower animals, there is a remarkable power of retaining vitality after the most serious injuries; nay, in portions actually severed from the body, it will continue for some time. Mr Patterson, in his excellent *Introduction to Zoology*, mentions that on one occasion he divided a fragment of the body of a *beroe*, lately taken from the shore and shattered by a storm, 'into portions so minute that one piece of skin had but two cilia attached to it, yet the vibration of these organs continued for nearly a couple of days afterwards!' But we must leave the *beroe*, charmer though it be.

Another member of this section—the *Ciliograde aculephæ*, as they are called—is the Girdle of Venus, which resembles a ribbon in form, and is sometimes five or six feet in length, covered with cilia, and brilliantly phosphorescent. This must be one of the most beautiful of the fireworks of the ocean.

The jelly-fishes of another section are furnished with one or more air-bags, which assist them in swimming, and hence bear the name of *hydropneustic aculephæ*. In the Portuguese man-of-war (*Physalia*), the bag is large, and floats conspicuously on the surface of the water. From the top of it rises a purple crest, which

acts as a sail, and by its aid the little voyager scuds gaily before the wind. But should danger threaten—should some hungry, piratical monster in quest of a dinner heave in sight, or the blast grow furious—the float is at once compressed, through two minute orifices at the extremities a portion of the air escapes, and down goes the little craft to the tranquil depths, leaving the storm or the pirate behind. In one species (*Cuvieria*), the floats are numerous and prettily ranged round the margin of the body. Resting on these, the creature casts about its long fishing-lines, and arrests the passing prey.

One more section remains to be noticed. The jelly-fishes which belong to it have a rudimentary skeleton—a plate which supports the soft, circular body. From the lower part of the body hang numerous tentacles (*cirri*), amidst which the mouth is placed. Probably these multitudinous arms assist in locomotion; and hence the name of the family, *Cirrigrades*. Amongst the creatures of this division we meet with some very interesting locomotive apparatus. There are some of them by no means obliged to trust to their oars alone—they have also sails. The *Velella*, large fleets of which visit our seas at times, has a plate (the mast) rising from its bluish disk or deck, covered with a delicate membrane (the sail) of snowy whiteness, by means of which it traverses the ocean. This sail, it has been noticed, 'is set at the same angle as the lateen-sail' of the Malays. We cannot doubt that it is admirably suited to its purpose, and the Malays may be proud of having nature as a voucher for their contrivance.

We find in another species a still more perfect rigging. In it (*Rattaria*) the crest is supplied with muscular bands, by means of which the sail can be lowered or raised at pleasure. These adaptations of structure are full of interest. Nothing can be more admirable than the sailing-gear of these little creatures. They have to traverse the surface of the ocean amidst all diversities of weather. Paddles alone would not suffice for them. They must be enabled to take advantage of the winds. Sails, therefore, are added, and the mightiest agents in nature are commissioned to speed the little voyagers on their way.

We have already mentioned that some of the jelly-fishes possess the power of stinging. Only a few of the larger species, however, seem to be thus endowed; and the name sea-nettle is by no means applicable to the class as a whole. The poisonous fluid which produces the irritating effect on the skin, and no doubt paralyses the creatures upon which the jelly-fish feeds, is secreted by the arms. By means of its poison-bearing tentacles, the soft, gelatinous medusa is more than a match for the armed crustacean and the scale-clad fish. We take from Professor Forbes the following graphic description of one of the stinging species:—'The *Cyanæa capillata* of our seas is a most formidable creature, and the terror of tender-skinned bathers. With its broad, tawny, festooned, and scalloped disk, often a full foot or more across, it flaps its way through the yielding waters, and drags after it a long train of ribbon-like arms, and seemingly interminable tails, marking its course when its body is far away from us. Once tangled in its trailing "hair," the unfortunate who has recklessly ventured across the graceful monster's path too soon writhes in prickly torture. Every struggle but binds the poisonous threads more firmly round his body, and then there is no escape; for when the winder of the fatal net finds his course impeded by the terrified human wrestling in its coils, he, seeking no contest with the mightier biped, casts loose his envenomed arms, and swims away. The amputated weapons severed from their parent body vent vengeance on the cause of their destruction, and sting as fiercely as if their original proprietor itself gave the word of attack.'

We now approach the most extraordinary portion

of the history of these creatures. Recent investigations have brought to light the most interesting facts respecting their reproduction and development. It is now known that the young jelly-fish passes through a series of transformations before reaching its perfect state.

At certain seasons, eggs are produced within the body of the parent in appropriate ovaries, where they are retained for a time. They are then transferred to a kind of marsupial pouch, analogous to that of the kangaroo, where their development proceeds. After passing through certain changes here, the egg issues from the maternal pouch as an oval body, clothed with cilia—an animalcule in external aspect, and as unlike its parent as can well be imagined. For awhile the little creature dances freely through the water, and leads a gay, roving life; but at last it prepares to 'settle'; selects a fitting locality; applies one extremity of its body to the surface of stone or weed, and becomes attached. And now another change passes over it. The cilia, no longer needed, disappear. A mouth is developed at the upper extremity of the body, furnished with a number of arms. Gradually this number increases, and the jelly-fish now appears in the disguise of a polype, which feeds voraciously on the members of the class from which it has itself so lately emerged. At this point there is a halt. The medusa remains in its polype state for some months. At the expiration of this term, a strange alteration in its appearance begins to take place. Rings are formed round its body, from ten to fifteen in number. These gradually deepen, until at length it is literally cut up into a number of segments, which rest one upon the other—their upper margins becoming elevated, and divided into eight lobes. It is, in fact, a pile of cup-shaped pieces, very loosely connected together. A little later, these pieces free themselves successively, and the sedate polype disappears in a company of sprightly young medusæ. These beings, indeed, still differ in some respects from the adult animal; but the differences gradually vanish, and we have the perfect jelly-fish as the final result of this extraordinary series of transformations.

Similar observations have been made respecting other tribes amongst the lower animals, and some interesting generalisations have been founded upon them, into which, however, it is not our present purpose to enter.

The *Acetophæ* are the principal agents concerned in the production of the beautiful phenomena of phosphorescence. The minute species—mere gelatinous specks—swarm at times by countless myriads in the waters of the ocean, and make its surface glow with 'vitalised fire.' The waves, as they curl and break, sparkle and flash forth light, and the track of the moving ship is marked by a lustrous line. 'In the torrid zones between the tropics,' says Humboldt, 'the ocean simultaneously develops light over a space of many thousand square miles. Here the magical effect of light is owing to the forces of organic nature. Foaming with light, the eddying waves flash in phosphorescent sparks over the wide expanse of waters, where every scintillation is the vital manifestation of an invisible animal world.' Beneath the surface larger forms are seen, brilliantly illuminated, and lighting up the mystic depths of the sea. Fiery balls and flaming ribbons shoot past; and submarine moons shine with a soft and steady light amidst the crowds of meteors. 'While sailing a little south of the Plata on one very dark night,' says Mr Darwin, 'the sea presented a wonderful and most beautiful spectacle. There was a fresh breeze; and every part of the surface, which during the day is seen as foam, now glowed with a pale light. The vessel drove before her bows two billows of liquid phosphorus, and in her wake she was followed by a milky train. As far as the eye reached, the crest of every wave was bright; and the sky above the horizon, from the reflected glare of these livid flames, was not so utterly obscure as over the vault of the heavens.' Even in

our own seas very beautiful displays of phosphorescence may be witnessed. On fine summer nights, a soft, tender light plays round the boat as it moves onward, and the oars drop liquid fire. For how much of beauty are we indebted to these living specks of jelly?

Of the extreme minuteness of some of the species, an idea may be formed from the fact, that 110,000 might be contained in a cubic foot of water. We can say nothing with certainty as to the cause of the phosphorescence of the medusæ, and shall not trouble our readers with mere speculations.

The jelly-fishes furnish us with a striking illustration of the profusion of life in the ocean. Provision has indeed been made for securing in all the realms of our globe the largest possible amount of sentient being, and consequently of happiness. And to each tribe a definite part is assigned—a special mission is intrusted. None can be spared from the economy of nature. The shoals of microscopic medusæ store up in their own tissues the minute portions of nutritious matter diffused through the waters, and supply food for the support of higher organisms. All the tribes of animated beings are dependent one upon another. That the greatest may enjoy its existence and fulfil its work, the least must hold its place and discharge its function. They co-operate unconsciously to secure the unity and harmony of a system which is designed to promote alike the interests of each and all of them.

STEEPLE-JACK'S SECRET.

You want me to tell you how it comes to pass that I am able to glide up a steeple like a spider, get astride upon the cross, and pull off my cap to the crowd below, like a gentleman on horseback saluting his acquaintances.* You want me to explain on what principle, as you call it, I do this. Well: principle, I suppose, means the rule or law by which a man does what he ought to do; and if so, it is a very good word to use. I will oblige you by explaining my principle, for I am as affable as any man that creeps to his dying day upon the surface of the earth; and I will tell you how it chanced that I found it out: at least I will try, for I am no scholar; and if you wish to understand me, you must have your ears open, and catch a meaning when you can. And this will do you good, whether you make anything out or not. I know fellows that go to the lectures, and come back as empty as they went. But what of that? They think they understand, and thought breeds thought; and when a man's mind is fairly astir, it is odds but something good turns up.

You must know, then, I began the world as a sailor; and I marvel to this day how I ever became anything else. Sailors are the stupidest set in creation. They are mere animals, except in the gift of speech; good, honest, docile animals, perhaps, but dull and narrow. They go round the small circle of their duties like a blind horse in a mill. Their faculties are rocked by the waves and lulled by the winds; and when they come ashore, they can see and understand nothing for the swimming of their heads. Drink makes them feel as if at sea again; and when the tankard is out, they return on board, and exchange one state of stupefaction for another. Well, I was a sailor, and the dullest of the tribe. No wonder, for I was at it when a young boy. I was never startled by the sights or sounds of the sea. The moaning of the wind, the rush of the waves, the silence of the calm, were parts of my own existence; and in the wildest storm, my mind never took a wider tack than just to think what the poor devils on shore would do now.

I was a handy lad, however. I could go aloft with any man on board, and never troubled the shrouds in

* See article, 'A Child's Toy,' in No. 418.

coming down when a rope was within springing distance. But this was instinct or habit: thought was not concerned in it—I had not found the principle. One day, it blew what sailors call great guns; our bulwarks were stove in pieces, and the sea swept the deck, crashing and roaring like a whole herd of tigers. There was something to do at the mast-head; and when the order came through the speaking-trumpet, seeing the men hesitate, I jumped upon the shrouds without thinking twice. But at that moment the ship gave a lurch, and, holding on like grim death, I was buried deep in the waves. Although still clutching the ropes, I had at first an idea that they had parted, and that we were on our way to the bottom together. This could not have lasted above a minute or so; but it seemed to me like a year. I heard every voice that had ever sounded in my ear since childhood; I saw every apparition that had ever glided before my fancy: the Sea-Serpent twisted his folds round my neck, and the keel of the Flying Dutchman grated along my back. When the vessel rose at last, and I rose with her, the waters gurgling in my throat and hissing in my ears, I did not attempt to spring up the shrouds. I looked round in horror for the objects of my excited thoughts; and as I saw another enormous wave advancing till it overhung me, instead of getting out of its reach, which I could easily have done, I kept staring at it as it broke into what seemed innumerable goblin faces and yelling voices over my head. I was down again. My leading thought now was that I would strike out and swim for my life. But when I had just made up my mind to this—which the sailors would have called being washed away—I rose once more to the surface—and struck up like a good one! I was at the cross-trees in a breath, and once in safety there, I looked back both with shame and indignation.

When my job was finished, I went higher up in a sort of dogged humour. I went higher, and higher, and higher than I ever ventured before, till I felt the mast bending and quivering in the gale like the point of a fishing-rod; and then I looked down upon the sea. And what, think you, I found there? Why, the goblin faces were small white specks of foam that I could hardly see; and their yelling voices were a smooth, round, swelling tone, that rolled like music through the rigging. The mountain-waves were like a flock of sheep in a meadow, running and gamboling, and lying down and rising up; and in the expanse beyond the neighbourhood of the ship, they were all lying down together, or wandering like shadows over a smooth surface. I felt grand then, I assure you. I looked down, and around, and above, till thoughts that were not the instincts of an animal, came dancing up in my mind, like bubbles upon the face of the sea. And as I returned slowly to the deck, these thoughts grew and multiplied, and began to arrange themselves into a form which I am not scholar enough to describe. But through this new medium, I saw things as they are, not as habit and prejudice make them. I did not fear the waves, and I did not despise them. I humoured the sea as I got down towards the bulwarks, which were still buried every now and then; and so I reached my quarters in safety.

And what has all this to do with it? I will tell you. With the means of doing a thing, nothing is difficult, if you only understand thoroughly the nature of the thing. The obstacles that commonly deter you are not in the thing, but in you; and until you understand this, you will keep gaping and shrinking, and saying, 'It is impossible.' Some folk, when looking out of a three or four storey window, feel as if they were going to fall. This is their own fault, not the fault of the window, for that is just like a parlour window, where they have no sensation of the sort. A man sits peaceably enough on the top of a tall, three-legged stool, and

could hitch himself round and round, and then get up and stand upon it erect for half a day, without any risk of falling. Now, a steeple is much more securely fixed than a stool; its top is as broad as a table; and there is nothing to prevent anybody from standing upon it as long as he pleases, if he only will not think he is going to fall. You go up half-a-dozen steps of a ladder without fear, and then persuade yourself you can go no farther; but there is nothing more dangerous in the next half-dozen, so far as they are themselves concerned; nor in the next hundred, nor the next thousand, for that matter. My secret consists in my *knowing* all this, although I feel that I have only described when, not how the knowledge came. Perhaps you, who are book-learned, may be able to make it out, and shew how it is that, when anything occurs to awaken the mind, and enable one to work from knowledge, not habit, he is ten times the man he was. Without this, I should have climbed a mast all my life; but with it, I took to leaping up steeples by means of a kite, in a way that makes many ignorant persons report that I manage it by holding on by the tail.

But a man who goes up a steeple must take care how he behaves, for the eyes of the world are upon him. He is not lost in a crowd, where he is seen only by his next neighbours. That man must pull off his cap and be affable; but he must not do even that to extravagance. When the Queen was passing up the Clyde, an American seaman got on the topgallant, and stood on his head. What was that for, I should be glad to know? Suppose her Majesty was coming along Princes Street, just to take the air like a lady, and look into the shop-windows, and I was to go right up to her, and stand on my head—what would she say? I surmise, that she would turn round to her Lord Gold Stick, and order him to give me a knock on the shins. I know she would, for she is a regular trumpe, and knows how people in every station should behave. I am ashamed of that American: he is a Yankee Noodle!

It may be said, that the Queen has the same advantage as myself—that she is up the steeple; but so is every ordinary bricklayer or emperor. The thing is to be able to look and understand when you are up. I once saw a curious sight as I sat with the swallows flying far under my feet. The people did not wander about the street here and there as usual, but hundreds after hundreds of small objects came on in regular array. Then I could see long lines of Lilliputian soldiers marching in the procession, with their tiny bayonets glancing in the sun; and every now and then came up a soft swell of music, feeble but sweet. 'What is all this about?' thought I. 'Are they going to set one of these little creatures over them for a baillie or a king?' And one did march in the middle with a small space round him; 'but perhaps,' thought I again, 'he is only a trumpeter.' Howbeit, the procession at last halted, and gathered, and closed, and stood still for a time; and there was another small swell of the instruments, with a feeble shout from the throng, and then they all stirred, and broke, and dispersed, and disappeared. This was just like the view from the mast-head: it made me feel grand. But when I came down, I had not replaced one prejudice with another. I did not despise the creatures I came among; for they were then of the same size as myself. I pulled off my cap to them, and was affable; only it did give me a queer thought—not a merry one—when I heard that the official they had made that day, on going home to his house, out of the grandeur and the din, was heard to commune with himself, saying: 'And me but a mortal man after all!'

Poetry? No, sirs, I have learned no poetry. I had poetry enough of my own without learning it, and so has everybody else. I once knew a fellow who wrote very good poetry; but few of us understood it. That

man lost his labour. It is nature that *makes* poetry; the poet has merely found out the art of stirring it in the hearts of men, where it lies ready-made, like the perfume of a flower. A poet who is not understood only makes a noise; and he is the greatest poet who makes the greatest number of human hearts to leap and tingle. But the fellow I mean piqued himself on not being understood. Like the Yankee Noodle, he cut capers that had no intelligible meaning in them, just to make people stare. As for my own share of poetry, I will tell you when I feel it stirring most. You must know that in the view from a steeple the form of objects is changed only in one direction—that is downwards. The small houses, the narrow streets, the little creatures creeping along them, and the feeble sounds they send up, make me feel grand. But when I turn my eyes to the heavens, I see no shadow of change. The clouds look awful, as if despising my poor attempt at approach; and they glide, and break, and fade, and build themselves up again—all in deep silence—in a way that makes me feel mean. Now this mean feeling is real poetry. The meaner I feel, the grander are they; and when I look long at them, and think long, and then begin to descend to the earth, to mingle with the little creatures who are my fellows, I tremble—but not with fear.

A philosopher, do you say? Fie! don't call names: I am a bricklayer. I know that such distance as human beings can climb to is but a small matter. I see things as they are. I do not fancy that it is more difficult to stand on a steeple than on a stool, or that it is more difficult to hold on by a rope at one height than at another. I observe that men and their affairs, when viewed from a steeple, are very insignificant; but the same insight into things teaches me, when I am among them myself, to pull off my cap and be affable. I know that the things of earth change according to distance, but that the things of heaven are unchangeable. And all I have got further to say is, that I am quite sensible that although when up in the air I am a sign and a marvel to the people below, when down among themselves I am but plain.

STEEPLE JACK.

FOOD OF THE ARCTIC REGIONS— FRANKLIN'S EXPEDITION.

A CERTAIN class of reasoners have argued themselves into the belief that, setting all other considerations aside, Sir John Franklin and his companions must have necessarily perished ere now from *lack of food*. When the four years, or so, of provisions he took out with him for the large crews of the vessels were all consumed, how, say they, would it be possible for so great a number of men to obtain food sufficient to support life in those awfully desolate regions? Let us examine the question a little.

Men in very cold climates certainly require a much larger amount of gross animal food than in southern latitudes—varying, of course, with their particular physical constitutions. Now, let us grant—though we do not positively admit it—that, however the provisions taken from England may have been economised, they have, nevertheless, all been consumed a couple of years ago, with the exception of a small quantity of preserved meats, vegetables, lemon-juice, &c. kept in reserve for the sick, or as a resource in the last extremity. As to spirits, we have the testimony of all arctic explorers, that their regular supply and use, so far from being beneficial, is directly the reverse—*weakening the constitution, and predisposing it to scurvy and other diseases*; and that, consequently, spirits should not be given at all, except on extraordinary occasions, or as a medicine. Sir John Ross, in his search of the North-West Passage in 1829, and following years, early stopped the issue of spirits to his

men, and with a most beneficial result. Therefore, the entire consumption of the stock of spirits on board Sir John Franklin's ships must not be regarded as a deficiency of any serious moment.

We shall then presume, that for upwards of two years the adventurers have been wholly dependent on wild animals, birds, and fish for their support. Here it becomes an essential element of consideration to form some approximate idea of the particular locality in which the missing expedition is probably frozen. Captain Penny tracked it up Wellington Strait and thence into Victoria Channel—a newly-discovered lake or sea of unknown extent, which reaches, for anything that can be demonstrated to the contrary, to the pole. It has long been noticed, that the mere latitude in the arctic regions is far from being a certain indication of the degree of cold which might naturally be expected from a nearer approach to the pole. For instance, cold is more intense in some parts of latitude 60 degrees than in 70 or 77 degrees; but this varies very much in different districts of the coast, and in different seasons; and we may remark in passing, that whenever there is a particularly mild winter in Britain, it is the reverse in the arctic regions; and so *vice versa*. The astonishment of Captain Penny on discovering the new polar sea in question was heightened by the fact, that it possessed a much warmer climate than more southern latitudes, and that it swarmed with fish, while its shores were enlivened with animals and flocks of birds. Moreover, *trees* were actually floating about: how they got there, and whence they came, is a mysterious and deeply-interesting problem. Somewhere in this sea Sir John Franklin's ships are undoubtedly at this moment. We say the ships are; for we do not for one moment believe that they have been sunk or annihilated. It is not very likely that any icebergs of great magnitude would be tossing about this inland sea in the summer season—in winter its waters would be frozen—and in navigating it, the ships would, under their experienced and judicious commander, pursue their unknown way with extreme caution and prudence. It is more probable that they were at length fast frozen up in some inlet, or that small floating fields of ice have conglomerated around them, and bound them in icy fetters to the mainland. Or it may be that Franklin sailed slowly along this mystic polar sea, until he reached its extremity and could get no farther; and that extremity would actually seem to be towards the Siberian coasts. One thing is quite certain—namely, that so far as Captain Penny's people were able to penetrate the channel—several hundred miles—there was no indication whatever that up to that point Franklin had met with any serious calamity, or that he had suffered from a fatal deficiency of the necessities of life.

Wherever his exact position may be, there is every reason to suppose that the country around him produces a supply of food at least equal to any other part of the arctic regions; and probably much more than equal, owing to the greater mildness of the climate. But we will only base our opinion on the fair average supply of food obtainable in the arctic regions generally; and now let us see what result we shall fairly arrive at.

The first consideration that strikes us, is the fact that all over these icy regions isolated tribes of natives are to be met with; and they do not exist in a starved and almost famished condition, like the miserable dwellers in Terra del Fuego, but in absolute abundance—such as it is. When Sir John Ross's ship was frozen up during the remarkably severe winter of 1829-30, in latitude 69 degrees 58 minutes, and longitude 90 degrees, he made the following remarks concerning a tribe of Esquimaux in his vicinity, which we quote as being peculiarly applicable to our view of the subject:—'It was for philosophers to interest

themselves in speculating on a horde so small and so secluded, occupying so apparently hopeless a country—so barren, so wild, and so repulsive, and yet enjoying the most perfect vigour, the most *well-fed health*, and all else that here constitutes not merely wealth, but the opulence of luxury, since they were as amply furnished with provisions as with every other thing that could be here necessary to their wants.

'Yes,' exclaims our friend the reasoner, 'but the constitution of an Esquimaux is peculiarly adapted to the climate and food: what he enjoys would poison a European; and he also possesses skill to capture wild animals and fish, which the civilised man cannot exercise.' Is this true? We answer to the first objection: only partially true; and the second, we utterly deny. The constitution of vigorous men—and all Franklin's crew were fine, picked young fellows—has a marvellous adaptability. It is incredible how soon a man becomes reconciled to, and healthful under, a totally different diet from that to which he has been all his life accustomed, so long as that change is suitable to his new home. We ourselves have personally experienced this to some extent, and were quite amazed at the rapid and easy way in which nature enabled us to enjoy and thrive on food at which our stomach would have revolted in England or any southern land. In every country in the world, 'from Indus to the pole,' the food eaten by the natives is that which is incomparably best suited to the climate. In the frozen regions, and every cold country, the best of all nourishment is that which contains a large proportion of fat and oil. In Britain, we read with disgust of the Greenlander eagerly swallowing whale-oil and blubber; but in his country, it is precisely what is best adapted to sustain vital energy. Europeans in the position of Franklin's crew would become acclimatised, and gradually accustomed to the food of the natives, even before their own provisions were exhausted; and after that, we may be very sure their appetites would lose all delicacy, and they would necessarily and easily conform to the usages, as regards food, of the natives around them. We may strengthen our opinion by the direct and decisive testimony of Sir John Ross himself, who says: 'I have little doubt, indeed, that many of the unhappy men who have perished from wintering in these climates, and whose histories are well known, might have been saved had they conformed, as is so generally prudent, to the usages and the experience of the natives.' Undoubtedly they might!

Secondly, as to the Europeans being unable to capture the beasts, birds, and fishes so dexterously as the natives, we have reason to know that the reverse is the case. It is true that the latter know the habits and haunts of wild creatures by long experience, and also know the best way to capture some of them; but a very little communication with natives enables the European to learn the secret; and he soon far excels his simple instructors in the art, being aided by vastly superior reasoning faculties, and also by incomparably better appliances for the chase. Firearms for shooting beasts and birds, and seines for catching fish, render the Esquimaux spears, and arrows, and traps mere children's toys in comparison. Moreover, a ship is never frozen up many weeks before some wandering tribe is sure to visit it; and all navigators have found the natives a mild, friendly, grateful people, with fewer vices than almost any other savages in the world. They will thankfully barter as many salmon as will feed a ship's crew one day for a file or two, or needles, or a tin-canister, or piece of old iron-hoop, or any trifling article of hardware; and so long as the vessel remains, they and other tribes of their kindred will frequently visit it, and bring animals and fish to barter for what is literally almost valueless to European adventurers.

An important consideration, is the *variety* of food

obtainable in the arctic regions. We need not particularly classify the creatures found in the two seasons of summer and winter, but may enumerate the principal together. Of animals fit for food are musk-oxen, bears, reindeer, hares, foxes, &c. Of fish, there is considerable variety, salmon and trout being the chief and never-failing supply. Of birds, there are ducks, geese, cranes, ptarmigan, grouse, plovers, partridges, sand-larks, shearwaters, gannets, gulls, mollemokes, dovekeys, and a score of other species. We personally know that the flesh of bears, reindeer, and some of the other animals, is most excellent: we have partaken of them with hearty relish. As to foxes, Ross informs us that, although his men did not like them at first, they eventually preferred fox-flesh to any other meat! And as to such birds as gannets and shearwaters, which are generally condemned as unpalatable, on account of their fishy taste, we would observe that the rancid flavour exists only in the fat. Separate it, and, as we ourselves can testify, the flesh of these birds is little inferior to that of the domestic pigeon, when either boiled or roasted. The majority of the creatures named may be captured in considerable numbers, in their several seasons, with only ordinary skill. But necessity sharpens the faculties of men to an inconceivable degree; and when the life of a crew depends on their success in the chase, they will speedily become expert hunters. It is true that the wild animals habitually existing in a small tract of country may soon be thinned, if not altogether exterminated; but bears, foxes, &c. continue to visit it with little average diminution in numbers. The fish never fail. The quantity of salmon is said to be immense, and they can be preserved in stock a very long period by being simply buried in snow-pits. The birds also regularly make their periodical appearance. Besides, parties of hunters would be despatched to scour the country at considerable distances, and their skill and success would improve with each coming season. In regard to fuel, the Esquimaux plan of burning the oil and blubber of seals, the fat of bears, &c. would be quite effective. In the brief but fervid summer season, every inch of ground is covered with intensely green verdure, and even with flowers; and there is a great variety of wild plants, including abundance of Angelica, sorrel, and scurvy-grass, also lichens and mosses, all of antiscorbutic qualities. We have ourselves seen the Laplanders eat great quantities of the sorrel-grass; and the Nordlanders told us that they boiled it in lieu of greens at table. These vegetables might be gathered each summer, and preserved for winter use.

We repeat, that since the poor, ignorant natives live in rude abundance, and lack nothing for mere animal enjoyment of life, it is impossible to doubt that Europeans, who in intelligence and resources are a superior race of beings, can fail to participate equally in all things which the Creator has provided for the support of man in this extremity of the habitable globe; also let it be borne in mind, that half-a-dozen Esquimaux devour almost as much food every day as will suffice for a ship's crew. Sir John Ross declares, that if they only ate moderately, any given district would support 'double their number, and with scarcely the hazard of want.' He says that an Esquimaux eats twenty pounds of flesh and oil a day, and, in fact, never ceases from devouring until compelled to desist from sheer repletion. Speaking of one meal taken in their company, we have this edifying observation:—'While we found that one salmon and half of another were more than enough for all us English, these voracious animals (the Esquimaux) had devoured two each. At this rate of feeding, it is not wonderful that their whole time is occupied in procuring food: each man had eaten fourteen pounds of this raw salmon, and it was probably but a luncheon after all, or a superfluous meal for the sake of our society! . . . The glutton bear—scandalised as

it may be by its name—might even be deemed a creature of moderate appetite in comparison: with their human reason in addition, these people, could they always command the means, would doubtless outlive a glutton and a boa-constrictor together.'

Finally, we expressly deny that the Esquimaux can or do bear extreme cold and privations better than Englishmen who have been a season or two in their country. Arctic explorers testify that the natives always appeared to suffer from cold quite as much as Europeans; and what little we have ourselves seen of northern countries, induces us to give ample credence to this.

The conclusion, then, at which we arrive is this: that under such experienced and energetic leaders as Sir John Franklin and his chief officers, the gallant crews of the missing expedition have not perished for lack of food, and will be enabled, if God so wills, to support life for years to come. Great, indeed, their sufferings must be; for civilised men do not merely eat to sleep, and sleep to eat, like the Esquimaux; but they will be upheld under every suffering by a firm conviction that their countrymen are making almost superhuman exertions to rescue them from their fearful isolation. What the final issue will be, is known only to Him who tempers the wind to the shorn lamb, and can, if He deems meet, provide a way of deliverance when hope itself has died in every breast. Our individual opinion is, that it is not improbable the lost crews will, sooner or later, achieve their own deliverance by arriving at some coast whence they may be taken off, even as Ross was, after sojourning during four years of unparalleled severity. But it is the bounden duty of our country never to relax its efforts to save Franklin, until there is an absolute certainty that all further human exertions are in vain.

[We give the above as a paper on the food of the arctic regions, and can only hope that our correspondent's cheering views as to the fate of the missing expedition may prove to be correct.—ED.]

THE ARTIST'S SACRIFICE.

On a cold evening in January—one of those dark and gloomy evenings which fill one with sadness—there sat watching by the bed of a sick man, in a little room on the fifth floor, a woman of about forty, and two pretty children—a boy of twelve and a little girl of eight. The exquisite neatness of the room almost concealed its wretchedness: everything announced order and economy, but at the same time great poverty. A painted wooden bedstead, covered with coarse but clean calico sheets, blue calico curtains, four chairs, a straw arm-chair, a high desk of dark wood, with a few books and boxes placed on shelves, composed the entire furniture of the room. And yet the man who lay on that wretched bed, whose pallid cheek, and harsh, incessant cough, foretold the approach of death, was one of the brightest ornaments of our literature. His historical works had won for him a European celebrity, his writings having been translated into all the modern languages; yet he had always remained poor, because his devotion to science had prevented him from devoting a sufficient portion of his time to productive labour.

An unfinished piece of costly embroidery thrown on a little stand near the bed, another piece of a less costly kind, but yet too luxurious to be intended for the use of this poor family, shewed that his wife and daughter—this gentle child whose large dark eyes were so full of sadness—endeavoured by the work of their hands to make up for the unproductiveness of his efforts. The sick man slept, and the mother, taking away the lamp and the pieces of embroidery, went with her children into the adjoining room, which served both as ante-chamber and dining-room: she seated herself at the

table, and took up her work with a sad and abstracted air; then observing her little daughter doing the same thing cheerfully, and her son industriously colouring some prints destined for a book of fashions, she embraced them; and raising her tearful eyes towards heaven, she seemed to be thanking the Almighty, and in the midst of her affliction, to be filled with gratitude to Him who had blessed her with such children.

Soon after, a gentle ring was heard at the door, and M. Raymond, a young doctor, with a frank, pleasing countenance, entered and inquired for the invalid. 'Just the same, doctor,' said Mme G—.

The young man went into the next room, and gazed for some moments attentively on the sleeper, whilst the poor wife fixed her eyes on the doctor's countenance, and seemed there to read her fate.

'Is there no hope, doctor?' she asked in a choking voice, as she conducted him to the other room. The doctor was silent, and the afflicted mother embraced her children and wept. After a pause she said: 'There is one idea which haunts me continually: I should wish so much to have my husband's likeness. Do you know of any generous and clever artist, doctor? Oh, how much this would add to the many obligations you have already laid me under!'

'Unfortunately, I am not acquainted with a single artist,' replied the young doctor.

'I must then renounce this desire,' said Mme G— sighing.

The next morning Henry—so the little boy was called—having assisted his mother and his sister Marie in their household labours, dressed himself carefully, and, as it was a holiday, asked leave to go out.

'Go, my child,' said his mother; 'go and breathe a little fresh air: your continual work is injurious to you.'

The boy kissed his father's wasted hand, embraced his mother and sister, and went out, at once sad and pleased. When he reached the street he hesitated for a moment, then directed his steps towards the drawing-school where he attended every day: he entered, and rung at the door of the apartment belonging to the professor who directed this academy. A servant opened the door, and conducted him into an elegantly-furnished breakfast-room; for the professor was one of the richest and most distinguished painters of the day. He was breakfasting alone with his wife, when Henry entered.

'There, my dear,' he said to her, as he perceived Henry; 'there is the cleverest pupil in the academy. This little fellow really promises to do me great credit one day. Well, my little friend, what do you wish to say to me?'

'Sir, my father is very ill—the doctor fears that he may die: poor mamma, who is very fond of papa, wishes to have his portrait. Would you, sir, be kind enough to take it? O do not, pray, sir, do not refuse me!' said Henry, whose tearful eyes were fixed imploringly on the artist.

'Impossible, Henry—impossible!' replied the painter. 'I am paid three thousand francs for every portrait I paint, and I have five or six at present to finish.'

'But, my dear,' interposed his wife, 'it seems to me that this portrait would take you but little time: think of the poor mother, whose husband will so soon be lost to her for ever.'

'It grieves me to refuse you, my dear; but you know that my battle-piece, which is destined for Versailles, must be sent to the Louvre in a fortnight, for I cannot miss the Exposition this year. But stay, my little friend, I will give you the address of several of my pupils: tell them I sent you, and you will certainly find some one of them who will do what you wish. Good-morning, Henry!'

'Good-by, my little friend,' added the lady. 'I hope you may be successful.' The boy took his leave with a bursting heart.

Henry wandered through the gardens of the Luxembourg, debating with himself if he should apply to the young artists whose addresses he held in his hand. Fearing that his new efforts might be equally unsuccessful, he was trying to nerve himself to encounter fresh refusals, when he was accosted by a boy of his own age, his fellow-student at the drawing-school. Jules proposed that they should walk together; then observing Henry's sadness, he asked him the cause. Henry told him of his mother's desire; their master's refusal to take the portrait; and of his own dislike to apply to those young artists, who were strangers to him.

'Come with me,' cried Jules, when his friend had ceased speaking. 'My sister is also an artist: she has always taken care of me, for our father and mother died when we were both very young. She is so kind and so fond of me that I am very sure she will not refuse.'

The two boys traversed the Avenue de l'Observatoire, the merry, joyous face of the one contrasting with the sadness and anxiety of the other. When they got to the end of the avenue they entered the Rue de l'Ouest, and went into a quiet-looking house, up to the fourth storey of which Jules mounted with rapid steps, dragging poor Henry with him. He tapped gaily at a little door, which a young servant opened: he passed through the antechamber, and the two boys found themselves in the presence of Emily d'Orbe, the sister of Jules.

She appeared to be about twenty-five: she was not tall, and her face was rather pleasing than handsome; yet her whole appearance indicated cultivation and amiability. Her dress was simple, but exquisitely neat; her gown of brown stuff fitted well to her graceful figure; her linen cuffs and collar were of a snowy whiteness; her hair was parted in front, and fastened up behind à l'antique: but she wore no ribbon, no ornament—nothing but what was necessary. The furniture of the room, which served at the same time as a sitting-room and studio, was equally simple: a little divan, some chairs and two arm-chairs covered with gray cloth, a round table, a black marble time-piece of the simplest form; two engravings, the 'Spasmo di Sicilia' and the 'Three Maries,' alone ornamented the walls; green blinds were placed over the windows, not for ornament, but to moderate the light, according to the desire of the artist; finally, three easels, on which rested some unfinished portraits, and a large painting representing Anna Boleyn embracing her daughter before going to execution.

When he entered, little Jules went first to embrace his sister; she tenderly returned his caresses, then said to him in a gentle voice, as she returned to her easel: 'Now, my dear child, let me go on with my painting;' not, however, without addressing a friendly 'Good-morning' to Henry, who she thought had come to play with Jules.

Henry had been looking at the unfinished pictures with a sort of terror, because they appeared to him as obstacles between him and his request. He dared not speak, fearing to hear again the terrible word 'impossible!' and he was going away, when Jules took him by the hand and drew him towards Emily. 'Sister,' he said, 'I have brought my friend Henry to see you; he wishes to ask you something; do speak to him.'

'Jules,' she replied, 'let me paint; you know I have very little time. You are playing the spoiled child: you abuse my indulgence.'

'Indeed, Emily, I am not jesting; you must really speak to Henry. If you knew how unhappy he is!'

Mlle d'Orbe, raising her eyes to the boy, was struck with his pale and anxious face, and said to him in a kind voice, as she continued her painting: 'Forgive my rudeness, my little friend; this picture is to be sent to the Exposition, and I have not a moment to lose, because, both for my brother's sake and my own, I wish it to do me credit. But speak, my child; speak

without fear, and be assured that I will not refuse you anything that is in the power of a poor artist.'

Henry, regaining a little courage, told her what he desired: then Jules having related his friend's visit to their master, Henry added: 'But I see very well, mademoiselle, that you cannot do this portrait either, and I am sorry to have disturbed you.'

In the meantime little Jules had been kissing his sister, and caressing her soft hair, entreating her not to refuse his little friend's request. Mlle d'Orbe was painting Anna Boleyn: she stopped her work; a struggle seemed to arise in the depth of her heart, while she looked affectionately on the children. She, however, soon laid aside her pallett, and casting one glance of regret on her picture: 'I will take your father's portrait,' she said to Henry—that man of sorrow, and of genius. Your mother's wish shall be fulfilled.'

She had scarcely uttered these words when a lady entered the room. She was young, pretty, and richly dressed. Having announced her name, she asked Mlle d'Orbe to take her portrait, on the express condition that it should be finished in time to be placed in the Exposition.

'It is impossible for me to have this honour, madame,' replied the artist: 'I have a picture to finish, and I have just promised to do a portrait to which I must give all my spare time.'

'You would have been well paid for my portrait, and my name in the catalogue would have made yours known,' added the young countess.

Mlle d'Orbe only replied by a bow; and the lady had scarcely withdrawn, when taking her bonnet and shawl, the young artist embraced her brother, took Henry by the hand, and said to him: 'Bring me to your mother, my child.'

Henry flew rather than walked; Mlle d'Orbe could with difficulty keep up with him. Both ascended to the fifth storey in the house in the Rue Descartes, where this poor family lived. When they reached the door, Henry tapped softly at it. Mme G—— opened it.

'Mamma,' said the boy, trembling with emotion, 'this lady is an artist: she is come to take papa's portrait.' The poor woman, who had not hoped for such an unexpected happiness, wept as she pressed to her lips the hands of Mlle d'Orbe, and could not find words to express her gratitude.

The portrait was commenced at once; and the young artist worked with zeal and devotion, for her admiration of the gifted and unfortunate man was intense. She resolved to make the piece valuable as a work of art, for posterity might one day demand the portrait of this gifted man, and her duty as a painter was to represent him in his noblest aspect.

Long sittings fatigued the invalid; so it was resolved to take two each day, and the young artist came regularly twice every day. As by degrees the strength of the sick man declined, the portrait advanced. At length, at the end of twelve days, it was finished: this was about a week before the death of M. G——.

At the same time that she was painting this portrait, Mlle d'Orbe worked with ardour on her large painting, always hoping to have it ready in time. This hope did not fail her until some days before the 1st of February. There was but a week longer to work: and this year she must abandon the idea of sending to the Exposition.

Some artists who had seen her picture had encouraged her very much; she could count, in their opinion, on brilliant success. This she desired with all her heart: first, from that noble thirst of glory which God has implanted in the souls of artists; and, secondly, from the influence it would have on the prospects of her little Jules, whom she loved with a mother's tenderness, and whom she wished to be able to endow with all the treasures of education. This disappointment, these long hours of toil, rendered so vain at the very moment when

she looked forward to receive her reward, so depressed the young artist, that she became dangerously ill.

M^{lle} d'Orbe had very few friends, as she was an orphan, and lived in great retirement; she found herself therefore completely left to the care of her young attendant. When Jules met Henry at the drawing-school he told him of his sister's illness: Henry informed his mother, and M^{me} G—— immediately hastened to M^{lle} d'Orbe, whom she found in the delirium of a fever from which she had been suffering for some days. The servant said that her mistress had refused to send for a doctor, pretending that her illness did not signify. M^{me} G——, terrified at the state of her young friend, went out and soon returned with Dr Raymond.

The invalid was delirious: she unceasingly repeated the words—'portrait,' 'Anna Boleyn,' 'exposition,' 'fortune,' 'disappointed hopes,' which plainly indicated the cause of her illness, and brought tears into the eyes of M^{me} G——. 'Alas!' she said, 'it is on my account she suffers: I am the cause of her not finishing her picture. Doctor, I am very unfortunate.'

'All may be repaired,' replied the doctor: 'if you will promise to nurse the invalid, I will answer for her recovery.'

In fact, M^{me} G—— never left the sick-bed of M^{lle} d'Orbe. The doctor visited her twice in the day, and their united care soon restored the health of the interesting artist.

Mademoiselle was scarcely convalescent when she went to the Exposition of paintings at the Louvre, of which she had heard nothing—the doctor and M^{me} G—— having, as she thought, avoided touching on a subject which might pain her. She passed alone through the galleries, crowded with distinguished artists and elegantly-dressed ladies, saying to herself that perhaps her picture would have been as good as many which attracted the admiration of the crowd. She was thus walking sadly on, looking at the spot where she had hoped to have seen her Anna Boleyn, when she found herself stopped by a group of artists. They were unanimous in their praises. 'This is the best portrait in the Exposition,' said one. 'A celebrated engraver is about to buy from the artist the right to engrave this portrait for the new edition of the author's works,' said another. 'We are very fortunate in having so faithful a likeness of so distinguished a writer as M. G——.'

At this name M^{lle} d'Orbe raised her eyes, and recognised her own work! Pale, trembling with emotion, the young artist was obliged to lean on the rail for support; then opening the catalogue, she read her name as if in a dream, and remained for some time to enjoy the pleasure of hearing the praises of her genius.

When the Exposition closed she hastened to M^{me} G——, and heard that it was Dr Raymond who had conceived the happy idea of sending the portrait to the Louvre. 'My only merit is the separating myself for a time from a picture which is my greatest consolation,' added M^{me} G——.

From this day the young artist became the friend of the poor widow, whose prospects soon brightened. Through the influence of some of the friends of her lost husband, she obtained a pension from government—a merited but tardy reward! The two ladies lived near each other, and spent their evenings together. Henry and Jules played and studied together. Marie read aloud, while her mother and M^{lle} d'Orbe worked. Dr Raymond sometimes shared in this pleasant intercourse. He had loved the young artist from the day he had seen her renounce so much to do a generous action; but, an orphan like herself, and with no fortune but his profession, he feared to be rejected if he offered her his hand. It was therefore M^{me} G—— who charged herself with pleading his suit with the young artist.

M^{lle} d'Orbe felt a lively gratitude towards the young doctor for the care and solicitude he had shewn

during her illness, and for sending her portrait to the Exposition. Thanks to him, she had become known; commissions arrived in numbers, a brilliant future opened before her and Jules. M^{me} G—— had, then, a favourable answer to give to her young friend, who soon became the husband of the interesting artist whose generous sacrifice had been the foundation of her happiness.

ACCIDENTS AT SEA.

On this subject an interesting return to an order of the House of Commons was lately made by the management of Lloyd's, and has caused some discussion in the public prints. The return applies to the four years ending December 1850; and during this period, it appears that the number of collisions, wrecks, and other accidents at sea, was 13,510; being at the rate of 8877 per annum, 9 per diem, or 1 for every 24 hours. Commenting on these details, the *Times* observes, that 'it must not be understood that every accident implies a total wreck, with the loss of all hands. If a ship carries away any of her important spars, or, on entering her port, strikes heavily against a pier, whereby serious damage is occasioned, the accident is duly registered in this pithy chronicle of Lloyd's. Nevertheless, as we glance up and down the columns, it is no exaggeration to say, that two-thirds of the accidents recorded are of the most serious description. We are unable to say to what degree this register of Lloyd's can be accepted as a fair index to the tragedies which are of such hourly occurrence upon the surface of the ocean. If all were known, we fear that this average of accident or wreck every 24 hours would be fearfully increased. The truth must be told. The incapacity of too many of the masters in the British mercantile marine has been the pregnant cause of loss to their owners and death to their crews. Men scarcely competent to take the responsibility of an ordinary day's work, or, if competent, of notoriously intemperate habits, were placed in command of sea-going ships through the parsimony or nepotism of the owners. The result of the educational clauses in the Mercantile Marine Bill of last session, will no doubt be to provide a much larger body of well-trained men, from among whom our shipowners can select the most competent persons for command.'

These observations called forth a reply from the President of the Seaman's Association, vindicating mariners from the charges so brought against them. A few passages from the letter of this respondent are worth noticing. 'Are British sailors,' he asks, 'really so bad as you represent? If so, then you condemn by implication the seamen of the United States, for they are also Anglo-Saxon. Let me direct your attention to a few facts bearing out this assertion. The desertions from the royal navy in 1846 (see Parliamentary Returns) were 2382; this is about 1 out of every 14 seamen annually. Nearly the whole of these men keep to the United States' service. Again, the desertions from Quebec in consequence of three things—first, low wages; secondly, register-tickets; thirdly, the payment of 1s., exacted from every man on shipment and discharge, to a shipping office, to uphold the Mercantile Marine Act, for which the men receive no value—were upwards of 1400 this season; and about 4000 from all other ports. From American statistics, it is proved that two-thirds of the seamen sailing in ships of the United States are British subjects; and if American ships are preferred to British, it must be because they are manned by our fine spirited tars. A large proportion of their ships are commanded by Englishmen.'

An effort, as is well known, has lately been made to elevate the character of British seamen, by means of registries under the Mercantile Marine Act, and the issuing of tickets, which must be produced by sailors. Our belief is, that much of the legislation on this sub-

ject has been injurious; as any law must be which attempts to regulate the bargains of employers and employed. It may be proper for master-mariners to be subjected to some kind of test of ability, but it appears to us that it would be equally beneficial to encourage young men to enter the profession. To pay well is, after all, the true way to get good servants. Why do British sailors desert to the American service? Because they are better paid. And having so deserted, they unfortunately cannot again procure employment under the British flag without producing a register-ticket, which, of course, they cannot do. Thus, picked men are permanently lost to the British navy. Besides offering higher wages, it might have proved extremely advantageous to open nautical schools for youths desirous of going to sea. According to existing arrangements, the sailor—like the French workman with his *livret*—is considered to be a child not fit to take care of himself; and the law interposes to say he shall do this, and do that, under a penalty for neglect of its provisions. This is to keep sailors in a state of perpetual tutelage; and being at variance with the principles of civil liberty, it is to be feared that the practice can lead to nothing but mischief.

As to wrecks, the cause of the chief disasters seems as often to be imperfect construction of vessels and imperfect stowage, as anything else; while loss of life for the greater part arises from a deficiency of boats, and the means of readily unshipping them. As victims of ill-made, badly-found, and rotten vessels, not to speak of land-sharks and sea-sharks—as the sufferers in life and limb when shippers and brokers may be actually benefiting from casualties—sailors, as a class, merit public sympathy instead of reproach or discouragement.

'VISIT TO AN ENGLISH MONASTERY.'

We have received a letter from the Abbot of Mount St Bernard's, pointing out, in courteous terms, several inaccuracies in the article which appeared with the above title in No. 413 of this Journal. Meat, it seems, is only 'strictly prohibited' to the healthy: it is allowed to the sick and infirm when prescribed by the doctor. Every night before compline the brethren meet to hear some pious lecture read, not to confess their thoughts to the superior. Instead of one meal a day, as stated by our correspondent, the lay-brethren, who are employed chiefly in manual labour, have at least two meals every day during the whole year, excepting fast-days; and the choir-brethren two meals a day during the summer, and one during the winter. To the latter, when they are of a weakly constitution, a collation is allowed in addition. The greatest error of all, however, appears to us to exist in the estimate formed of the abbot, who, judging by his correspondence, is evidently as informed and intelligent a person as is usually met with out of the monastic circle.

AMERICAN HOMAGE TO SHAKESPEARE AND MRS COWDEN CLARKE.

There is a work to which many of our readers are probably strangers, but which has roused the enthusiasm of the New World. It is a work of immense labour, which in writing and correcting proofs occupied its author sixteen years. This author is a lady, and the production on which she bestowed so much unwearied patience and perseverance, during a space of time equivalent in most cases to an entire literary life, is a Concordance to Shakespeare. 'Her work,' says Mr Webster, the American Secretary of State, 'is a perfect wonder, surpassingly full and accurate, and exhibiting proof of unexampled labour and patience. She has treasured up every word of Shakespeare, as if he were her lover, and she were his.' But Mr Webster and his countrymen were not satisfied even with such generous praise: they determined to present Mrs Clarke with an enduring testimonial of their gratitude and respect; and,

accordingly, the ceremony has recently been performed by Mr Abbot Laurence, the American minister. The list of subscribers, we are told, 'contains names from Maine to Mexico. Even the far, far west, Wisconsin, Michigan, and Illinois, have contributed; whilst Alabama, Florida, Georgia, Maryland, Massachusetts, New York, Pennsylvania, Ohio, and South Carolina, swell the list of the most distinguished American literati, embracing a fair sprinkling of fair ladies. There is even a subscriber from the shores of the Pacific.' The testimonial is an elaborately carved library chair, bearing on the top rail a mask of Shakespeare, copied in ivory from the Stratford bust, wreathed with oak-leaves and laurel, and shaded by the wings of two of 'Avon's swans.' Although an elegant and costly gift, however, in itself, there is attached to this testimonial a meaning and a value which we trust will make its due impression in the native land of Shakespeare—in that mother-country to which the eyes of her western descendants are thus turned in the lofty sympathy which binds together throughout the whole world the children and worshippers of genius.

TO WORDSWORTH.

THE voice of Nature in her changeful moods
Breathes o'er the solemn waters as they flow,
And 'mid the wavings of the ancient woods
Murmurs, now filled with joy, now sad and low.
Thou gentle poet, she hath tuned thy mind
To deep accordance with the harmony
That floats above the mountain summits free—
A concert of Creation on the wind.
And thy calm strains are breathed as though the dove
And nightingale had given thee for thy dower
The soul of music and the heart of love;
And with a holy, tranquillising power
They fall upon the spirit, like a gleam
Of quiet star-light on a troubled stream.

M. A. HOARE.

INTELLECT DEVELOPED BY LABOUR.

Are labour and self-culture irreconcilable to each other? In the first place, we have seen that a man, in the midst of labour, may and ought to give himself to the most important improvements, that he may cultivate his sense of justice, his benevolence, and the desire of perfection. Toil is the school for these high principles; and we have here a strong presumption that, in other respects, it does not necessarily blight the soul. Next, we have seen that the most fruitful sources of truth and wisdom are not books, precious as they are, but experience and observation; and these belong to all conditions. It is another important consideration, that almost all labour demands intellectual activity, and is best carried on by those who invigorate their minds; so that the two interests, toil and self-culture, are friends to each other. It is mind, after all, which does the work of the world, so that the more there is of mind, the more work will be accomplished. A man, in proportion as he is intelligent, makes a given force accomplish a greater task; makes skill take the place of muscle, and with less labour, gives a better product. Make men intelligent, and they become inventive; they find shorter processes. Their knowledge of nature helps them to turn its laws to account, to understand the substances on which they work, and to seize on useful hints, which experience continually furnishes. It is among workmen that some of the most useful machines have been contrived. Spread education, and as the history of this country shews, there will be no bounds to useful invention.—*Channing.*

Printed and Published by W. and R. CHAMBERS, High Street, Edinburgh. Also sold by W. S. OUN, Amen Corner, London; D. N. CHAMBERLAIN, 55 West Nile Street, Glasgow; and J. M'GLASHAN, 50 Upper Sackville Street, Dublin.—Advertisements for Monthly Parts are requested to be sent to MAXWELL & CO., 31 Nicholas Lane, Lombard Street, London, to whom all applications respecting their insertion must be made.

THE PATTERN NATION.

It seems to be the destiny of France to work out all sorts of problems in state and social policy. It may be said to volunteer experiments in government for the benefit of mankind. All kinds of forms it tries, one after the other: each, in turn, is supposed to be the right thing; and when found to be wrong, an effort, fair or unfair, is made to try something else. It would surely be the height of ingratitude not to thank our versatile neighbour for this apparently endless series of experiments.

Unfortunately, the novel projects extemporised by the French are not on all occasions easily laid aside. What they have laid hold on, they cannot get rid of. We have a striking instance of this in the practice of subdividing lands. Forms of state administration may be altered, and after all not much harm done; it is only changing one variety of power at the Tuileries for another. A very different thing is a revolution in the method of holding landed property. Few things are more dangerous than to meddle with laws of inheritance: if care be not taken, the whole fabric of society may be overthrown. The unpleasant predicament which the French have got into on this account is most alarming—far more terrible than the wildest of their revolutions. How they are to get out of it, no man can tell.

Latterly, the world has heard much of Socialism. This is the term applied to certain new and untried schemes of social organisation, by which, among other things, it is proposed to supersede the ordinary rights of property and laws of inheritance—the latter, as is observed, having, after due experience, failed to realise that happiness of condition which was anticipated sixty years ago at their institution. As it is always instructive to look back on the first departure from rectitude, let us say a few words as to how the French fell into their present unhappy position.

At the Revolution of 1789–93, it will be recollected that the laws of primogeniture were overthrown, and it was ordained that in future every man's property should be divided equally among his children at his death: there can be no doubt that considerations of justice and humanity were at the foundation of this new law of inheritance. Hitherto, there had been a great disparity in the condition of high and low: certain properties, descending from eldest son to eldest son, had become enormously large, and were generally ill managed; while prodigious numbers of people had no property at all, and were dependents on feudal superiors. The country was undoubtedly in a bad condition, and some modification of the law was desirable. Reckless of

consequences, the system as it stood was utterly swept away, and that of equal partition took its place. About the same period, vast domains belonging to the crown, the clergy, and the nobility, were sequestered and sold in small parcels; so that there sprang up almost at once a proprietary of quite a new description. Had the law of equal partition been extended only to cases in which there was no testamentary provision, it could not have inflicted serious damage, and would at all events have been consistent with reason and expediency: but it went the length of depriving a parent of the right to distribute his property in the manner he judged best, and handed over every tittle of his earnings in equal shares to his children. One child might be worthless, and another the reverse; no matter—all were to be treated alike. No preference could be shewn, no posthumous reward could be given for general good-conduct or filial respect. In all this, there was something so revolting to common sense, that one feels a degree of wonder that so acute a people as the French should have failed to observe the error into which they were plunging.

For every law, however bad, there is always some justification or plea of necessity. Besides tending to level the position of individuals, the plan of equal distribution of property was said to be justifiable on the ground that there are more than two parties concerned. Society, it was alleged, comes in as a third, and says to the parent: 'You must provide for this son, however worthless; you must not throw him destitute on our hands; for that is to shift the responsibility from yourself, who brought him into the world, to us, who have nothing to do with him.' This plea, more plausible than sound, had its effect. That an occasional wrong might not be inflicted, a great national error, practically injurious, was committed.

A compulsory law of equal division of lands among the children of a deceased proprietor, may be long in revealing its horrors in a country where the redundant population sheds habitually off. In Switzerland, for example, the evil of a subdivision of lands is marked but in a moderate degree—though bad enough in the main—because a certain proportion of each generation emigrates in quest of a livelihood—the young men going off to be mercenary soldiers in Italy, waiters at hotels, and so forth; and the young women to be governesses and domestic servants. France, on the contrary, is the last nation in the world to try the subdivision principle. Its people, with some trifling exceptions, go nowhere, as if affecting to despise all the rest of the world. Contented with moderate fortunes, inclined to make amusement their occupation, unwilling or unable to learn foreign languages, or to care for anything abroad,

and having so intense a love of France, that they will not emigrate, they necessarily settle down in a gradually aggregating mass, and are driven to the very last shifts for existence. Only two things have saved the nation from anarchy: the remarkable circumstance of few families consisting of more than two, or at most three children, any more being deemed a culpable monstrosity; and the draughting of young men for the army. In other words, the war-demon is an engine to keep the population in check; for if it does not at once kill off men, it occupies them in military affairs at the public expense. The prodigious number of civil posts under government—said to be upwards of half a million—acts also as a means for absorbing the overplus rural population.

Circumstances of the nature here pointed out have modified the evil effects of the law of subdivision; but after making every allowance on this and every other score that can be suggested, it is undeniable that the partition of property has gone down and down, till at length, in some situations, it can go no further. The morsels of land have become so small, that they are not worth occupying, and will barely realise the expense of legal transfer. In certain quarters, we are informed, the individual properties are not larger than a single furrow, or a patch the size of a cabbage-garden. A good number of these landed estates—one authority says a million and a quarter—are about five acres in extent, which is considered quite a respectable property; but as, at the death of each proprietor, there is a further partition, the probability would seem to be that, ultimately, the surface of France will resemble the worst parts of Ireland, with a population sunk to the lowest grade of humanity. Perhaps, however, the evils inflicted on society through the agency of subdivision, are mainly incidental. General injury goes on at a more rapid rate than the actual partition of property. From the causes above mentioned, the population in France is long in doubling itself; and the slower the increase, the slower the subdivision. Already, however, the properties are so small, that they do not admit of that profitable culture enjoined by principles of improved husbandry and correct social policy. In the proper cultivation of the soil, other parties besides agriculturists are concerned; for whatever limits production, affects the national wealth. The meagre husbandry of the small properties in France is thus a serious loss to the country, and tends to general impoverishment. But there is another and equally calamitous consequence of excessive subdivision. The small proprietors in France are for the greater part owners only in name: practically, they are tenants. Desperate in their circumstances, they have borrowed money on their wretched holdings; and so poor is the security, and so limited is the capital at disposal on loan, that the interest paid on mortgage runs from 8 to 10 per cent.—often is as high as 20 per cent. After paying taxes, interest on loans, and other necessary expenses, such is the exhaustion of resources, that thousands of these French peasant proprietors may be said to live in a continual battle with famine. According to official returns, there are in France upwards of 348,000 dwellings with no other aperture than the door; and nearly 2,000,000 with only one window. And to this the 'pattern nation' has brought itself by its headlong haste to upset, not simply improve, a bad institution. The living in these windowless and single-windowed abodes is not living, in the proper sense of the word: it is existence without comfort, without hope. The next step is to burrow in holes like rabbits.

It will thus be observed, that the subdivision of real estate has brought France pretty much back to the point where it started—a small wealthy class, and a very numerous poor class. The computation is, that in a population of 36,000,000, only 800,000 are in easy circumstances. A considerable proportion of this moneyed class are usurers, living in Paris and other large towns. They are the lenders of cash on bonds, which squeeze out the very vitals of the nation—the gay flutterers and loungers of the streets, theatres, and cafés, drawing the means of luxurious indulgence from the myriads who toil out their lives in the fields.

Obtaining a glimpse of these facts, we can no longer wonder at the submission of the French peasantry to a thinning of their families by military conscription; at the eager thirst for office which afflicts the whole nation; or at the morbid desire to overturn society, and strike out a better organisation. As matters grow worse, this passion for wholesale change becomes more fervidly manifested. The *jacqueries* of the middle ages are renewed. Various districts of country, in which poverty has reached its climax, break into universal insurrection. It is a war levied by those who have nothing against those who have something. To have coin in the pocket, is to be the enemy. The cry is: Down with the rich; take all they have got, and divide the plunder amongst us. Such are the avowed principles of the Socialists. According to them, all property is theft, and taking by violence is only recovering stolen goods! When a nation has come to this deplorable pass, what, it may be asked, can cure it? The malady is not political; it is social. Perhaps, under a right development of industry, France has not too great a population; but, subject to the present misdirection of its energies, the position of the country is assuming a gravity of aspect which may well engage the most earnest consideration. The least that could be recommended is an immediate change in the law which so unscrupulously subdivides and ruins landed property.

The history of the Revolution of 1789-93, must have made a feeble impression, if it has failed to print a deep and indelible conviction on the mind, that the acts of that great and wicked drama would some day be bitterly expiated. To expect anything else would be to impeach the principles of everlasting justice. Bearing in remembrance the horrid excesses of almost an entire nation, nothing that now occurs in France affords us the least surprise. The anarchical revolts of 1851, are only a sequence of crimes committed upwards of half a century ago. Philosophically, the beginning and the end are one thing. Blind with rage against all that was noble, holy, and simply respectable, the innocent were dragged in crowds to the scaffold, and their property confiscated and disposed of. See the consequence after a lapse of sixty years. 'My sin hath found me out.' The ill-gotten wealth has been the very instrument to punish and prostrate. A robbery followed by divisions among the spoilers. Waste succeeded by clamorous destitution. What a lesson!

It is needless to say, that Socialism, which proposes a universal re-distribution of property, with some unintelligible organisation of labour—all on an equality, no rich and no poor, no masters and no servants, everybody sharing his dinner with his neighbour—is a fancy as baseless as any crotchet which even the 'pattern nation' has ever concocted. Yet, it is not the less likely to be carried into execution, perhaps only the more likely from its practical absurdity. Of course, the more educated and wealthy portion of the nation view the doctrines of Socialism, as far as they can comprehend them, with serious apprehension; but unhappily for France, these classes uniformly submit to any folly or crime, which comes with the emphasis of authority, valid or usurped. At present, they may be said to

have made a compromise, bartering civil liberty for bare safety—permission to live! But how long this will last, and what form the tenure of property is to assume, are questions not easy to answer. It would not surprise us to see the nation, in its corporate capacity, assume the position of universal lender of money on, or proprietor of, embarrassed estates; in which case the 'ryot system' of India will, strangely enough, have found domestication in Europe! Is this to be the next experiment?

A curious and saddening problem is the future of this great country. 'France,' said Robespierre in one of his moments of studied inspiration, 'has astonished all Europe with her prodigies of reason!' We are now witnessing the development of several of these astonishing prodigies; and the spectacle, to say the least of it, is instructive.

MY TRAVELLING COMPANION.

My picture was a failure. Partial friends had guaranteed its success; but the Hanging Committee and the press are not composed of one's partial friends. The Hanging Committee thrust me into the darkest corner of the octagon-room, and the press ignored my existence—excepting in one instance, when my critic dismissed me in a quarter of a line as a 'presumptuous dauber.' I was stunned with the blow, for I had counted so securely on the L200 at which my grand historical painting was dog-cheap—not to speak of the deathless fame which it was to create for me—that I felt like a mere wreck when my hopes were flung to the ground, and the untasted cup dashed from my lips. I took to my bed, and was seriously ill. The doctor bled me till I fainted, and then said, that he had saved me from a brain-fever. That might be, but he very nearly threw me into a consumption, only that I had a deep chest and a good digestion. Pneumonic expansion and active chyle saved me from an early tomb, yet I was too unhappy to be grateful.

But why did my picture fail? Surely it possessed all the elements of success! It was grandly historical in subject, original in treatment, pure in colouring; what, then, was wanting? This old warrior's head, of true Saxon type, had all the majesty of Michael Angelo; that young figure, all the radiant grace of Correggio; no Rembrandt shewed more severe dignity than my burnt umber monk in the corner; and Titian never excelled the loveliness of this cobalt virgin in the foreground. Why did it not succeed? The subject, too—the 'Finding of the Body of Harold by Torch-light'—was sacred to all English hearts; and being conceived in an entirely new and original manner, it was redeemed from the charge of triteness and wearisomeness. The composition was pyramidal, the apex being a torch borne aloft for the 'high light,' and the base shewing some very novel effects of herbage and armour. But it failed. All my skill, all my hope, my ceaseless endeavour, my burning visions, all—all had failed; and I was only a poor, half-starved painter, in Great Howard Street, whose landlady was daily abating in her respect, and the butcher daily abating in his punctuality; whose garments were getting threadbare, and his dinners hypothetical, and whose day-dreams of fame and fortune had faded into the dull-gray of penury and disappointment. I was broken-hearted, ill, hungry; so I accepted an invitation from a friend, a rich manufacturer in Birmingham, to go down to his house for the Christmas holidays. He had a pleasant place in the midst of some ironworks, the blazing chimneys of which, he assured me, would afford me some exquisite studies of 'light' effects.

By mistake, I went by the Express train, and so was thrown into the society of a lady whose position would have rendered any acquaintance with her impossible, excepting under such chance-conditions as the present;

and whose history, as I learned it afterwards, led me to reflect much on the difference between the reality and the seeming of life.

She moved my envy. Yes—base, mean, low, unartistic, degrading as is this passion, I felt it rise up like a snake in my breast when I saw that feeble woman. She was splendidly dressed—wrapped in furs of the most costly kind, trailing behind; her velvets and lace worth a countess's dowry. She was attended by obsequious menials; surrounded by luxuries; her compartment of the carriage was a perfect palace in all the accessories which it was possible to collect in so small a space; and it seemed as though 'Cleopatra's cup' would have been no impracticable draught for her. She gave me more fully the impression of luxury, than any person I had ever met with before; and I thought I had reason when I envied her.

She was lifted into the carriage carefully; carefully swathed in her splendid furs and lustrous velvets; and placed gently, like a wounded bird, in her warm nest of down. But she moved languidly, and fretfully thrust aside her servants' busy hands, indifferent to her comforts, and annoyed by her very blessings. I looked into her face: it was a strange face, which had once been beautiful; but ill-health, and care, and grief, had marked it now with deep lines, and coloured it with unnatural tints. Tears had washed out the roses from her cheeks, and set large purple rings about her eyes; the mouth was hard and pinched, but the eyelids swollen; while the crossed wrinkles on her brow told the same tale of grief grown petulant, and of pain grown sour, as the thin lip, quivering and querulous, and the nervous hand, never still and never strong.

The train-bell rang, the whistle sounded, the lady's servitors stood bareheaded and courtesying to the ground, and the rapid rush of the iron giant bore off the high-born dame and the starveling painter in strange companionship. Unquiet and unresting—now shifting her place—now letting down the glass for the cold air to blow full upon her withered face—then drawing it up, and chafing her hands and feet by the warm-water apparatus concealed in her *chauffe-pied*, while shivering as if in an ague-fit—sighing deeply—lost in thought—wildly looking out and around for distraction—she soon made me ask myself whether my envy of her was as true as deep sympathy and pity would have been.

'But her wealth—her wealth!' I thought. 'True she may suffer, but how gloriously she is solaced! She may weep, but the angels of social life wipe off her tears with perfumed linen, gold embroidered; she may grieve, but her grief makes her joys so much the more blissful. Ah! she is to be envied after all!—envied, while I, a very beggar, might well scorn my place now!'

Something of this might have been in my face, as I offered my sick companion some small attention—I forget what—gathering up one of her luxurious trifles, or arranging her cushions. She seemed almost to read my thoughts as her eyes rested on my melancholy face; and saying abruptly: 'I fear you are unhappy, young man?' she settled herself in her place like a person prepared to listen to a pleasant tale.

'I am unfortunate, madam,' I answered.

'Unfortunate?' she said impatiently. 'What! with youth and health, can you call yourself unfortunate? When the whole world lies untried before you, and you still live in the golden atmosphere of hope, can you pamper yourself with sentimental sorrows? Fie upon you!—fie upon you! What are your sorrows compared with mine?'

'I am ignorant of yours, madam,' I said respectfully; 'but I know my own; and, knowing them, I can speak of their weight and bitterness. By your very position, you cannot undergo the same kind of distress as that overwhelming me at this moment: you may have evils in your path of life, but they cannot equal mine.'

'Can anything equal the evils of ruined health and a desolated hearth?' she cried, still in the same impatient manner. 'Can the worst griefs of wayward youth equal the bitterness of that cup which you drink at such a time of life as forbids all hope of after-assuagement? Can the first disappointment of a strong heart rank with the terrible desolation of a wrecked old age? You think because you see about me the evidences of wealth, that I must be happy. Young man, I tell you truly, I would gladly give up every farthing of my princely fortune, and be reduced to the extreme of want, to bring back from the grave the dear ones lying there, or pour into my veins one drop of the bounding blood of health and energy which used to make life a long play-hour of delight. Once, no child in the fields, no bird in the sky, was more blessed than I; and what am I now?—a sickly, lonely old woman, whose nerves are shattered and whose heart is broken, without hope or happiness on the earth! Even death has passed me by in forgetfulness and scorn!'

Her voice betrayed the truth of her emotion. Still, with an accent of bitterness and complaint, rather than of simple sorrow, it was the voice of one fighting against her fate, more than of one suffering acutely and in despair: it was petulant rather than melancholy; angry rather than grieving; shewing that her trials had hardened, not softened her heart.

'Listen to me,' she then said, laying her hand on my arm, 'and perhaps my history may reconcile you to the childish depression, from what cause soever it may be, under which you are labouring. You are young and strong, and can bear any amount of pain as yet: wait until you reach my age, and then you will know the true meaning of the word despair! I am rich, as you may see,' she continued, pointing to her surroundings—'in truth, so rich that I take no account either of my income or my expenditure. I have never known life under any other form; I have never known what it was to be denied the gratification of one desire which wealth could purchase, or obliged to calculate the cost of a single undertaking. I can scarcely realise the idea of poverty. I see that all people do not live in the same style as myself, but I cannot understand that it is from inability: it always seems to me to be from their own disinclination. I tell you, I cannot fully realise the idea of poverty; and you think this must make me happy, perhaps?' she added sharply, looking full in my face.

'I should be happy, madam, if I were rich,' I replied. 'Suffering now from the strain of poverty, it is no marvel if I place an undue value on plenty.'

'Yet see what it does for me!' continued my companion. 'Does it give me back my husband, my brave boys, my beautiful girl? Does it give rest to this weary heart, or relief to this aching head? Does it soothe my mind or heal my body? No! It but oppresses me, like a heavy robe thrown round weakened limbs: it is even an additional misfortune, for if I were poor, I should be obliged to think of other things beside myself and my woes; and the very mental exertion necessary to sustain my position would lighten my miseries. I have seen my daughter wasting year by year and day by day, under the warm sky of the south—under the warm care of love! Neither climate nor affection could save her: every effort was made—the best advice procured—the latest panacea adopted; but to no effect. Her life was prolonged, certainly; but this simply means, that she was three years in dying, instead of three months. She was a gloriously lovely creature, like a fair young saint for beauty and purity—quite an ideal thing, with her golden hair and large blue eyes! She was my only girl—my youngest, my darling, my best treasure! My first real sorrow—now fifteen years ago—was when I saw her laid, on her twenty-first birthday, in the English burial-ground at Madeira. It is on the gravestone, that she died of

consumption: would that it had been added—and her mother of grief! From the day of her death, my happiness left me!'

Here the poor lady paused, and buried her face in her hands. The first sorrow was evidently also the keenest; and I felt my own eyelids moist as I watched this outpouring of the mother's anguish. After all, here was grief beyond the power of wealth to assuage: here was sorrow deeper than any mere worldly disappointment.

'I had two sons,' she went on to say after a short time—'only two. They were fine young men, gifted and handsome. In fact, all my children were allowed to be very models of beauty. One entered the army, the other the navy. The eldest went with his regiment to the Cape, where he married a woman of low family—an infamous creature of no blood; though she was decently conducted for a low-born thing as she was. She was well-spoken of by those who knew her; but what *could* she be with a butcher for a grandfather! However, my poor infatuated son loved her to the last. She was very pretty, I have heard—young, and timid; but being of such fearfully low origin, of course she could not be recognised by my husband or myself! We forbade my son all intercourse with us, unless he would separate himself from her; but the poor boy was perfectly mad, and he preferred this low-born wife to his father and mother. They had a little baby, who was sent over to me when the wife died—for, thank God! she did die in a few years' time. My son was restored to our love, and he received our forgiveness; but we never saw him again. He took a fever of the country, and was a corpse in a few hours. My second boy was in the navy—a fine high-spirited fellow, who seemed to set all the accidents of life at defiance. I could not believe in any harm coming to him. He was so strong, so healthy, so beautiful, so bright: he might have been immortal, for all the elements of decay that shewed themselves in him. Yet this glorious young hero was drowned—wrecked off a coral-reef, and flung like a weed on the waters. He lost his own life in trying to save that of a common sailor—a piece of pure gold bartered for the foulest clay! Two years after this, my husband died of typhus fever, and I had a nervous attack, from which I have never recovered. And now, what do you say to this history of mine? For fifteen years, I have never been free from sorrow. No sooner did one grow so familiar to me, that I ceased to tremble at its hideousness, than another, still more terrible, came to overwhelm me in fresh misery. For fifteen years, my heart has never known an hour's peace; and to the end of my life, I shall be a desolate, miserable, broken-hearted woman. Can you understand, now, the valuelessness of my riches, and how desolate my splendid house must seem to me? They have been given me for no useful purpose here or hereafter; they encumber me, and do no good to others. Who is to have them when I die? Hospitals and schools? I hate the medical profession, and I am against the education of the poor. I think it the great evil of the day, and I would not leave a penny of mine to such a radical wrong. What is to become of my wealth?'—

'Your grandson,' I interrupted hastily: 'the child of the officer.'

The old woman's face gradually softened. 'Ah! he is a lovely boy,' she said; 'but I don't love him—no, I don't,' she repeated vehemently. 'If I set my heart on him, he will die or turn out ill: take to the low ways of his wretched mother, or die some horrible death. I steel my heart against him, and shut him out from my calculations of the future. He is a sweet boy: interesting, affectionate, lovely; but I will not allow myself to love him, and I don't allow him to love me! But you ought to see him. His hair is like my own daughter's—long, glossy, golden hair; and his eyes are large and blue, and the lashes curl on his cheek like

heavy fringes. He is too pale and too thin : he looks sadly delicate ; but his wretched mother was a delicate little creature, and he has doubtless inherited a world of disease and poor blood from her. I wish he was here though, for you to see ; but I keep him at school, for when he is much with me, I feel myself beginning to be interested in him ; and I do not wish to love him—I do not wish to remember him at all ! With that delicate frame and nervous temperament, he *must* die ; and why should I prepare fresh sorrow for myself, by taking him into my heart, only to have him plucked out again by death ?

All this was said with the most passionate vehemence of manner, as if she were defending herself against some unjust charge. I said something in the way of remonstrance. Gently and respectfully, but firmly, I spoke of the necessity for each soul to spiritualise its aspirations, and to raise itself from the trammels of earth ; and in speaking thus to her, I felt my own burden lighten off my heart, and I acknowledged that I had been both foolish and sinful in allowing my first disappointment to shadow all the sunlight of my existence. I am not naturally of a desponding disposition, and nothing but a blow as severe as the non-success of my 'Finding the Body of Harold by Torch-light' could have affected me to the extent of mental prostration as that under which I was now labouring. But this was very hard to bear ! My companion listened to me with a kind of blank surprise, evidently unaccustomed to the honesty of truth ; but she bore my remarks patiently, and when I had ended, she even thanked me for my advice.

'And now, tell me the cause of your melancholy face' she asked, as we were nearing Birmingham. 'Your story cannot be very long, and I shall have just enough time to hear it.'

I smiled at her authoritative tone, and said quietly : 'I am an artist, madam, and I had counted much on the success of my first historical painting. It has failed, and I am both penniless and infamous. I am the "presumptuous dauber" of the critics—despised by my creditors—emphatically a failure throughout.'

'Pshaw !' cried the lady impatiently ; 'and what is that for a grief ? a day's disappointment which a day's labour can repair ! To me, your troubles seem of no more worth than a child's tears when he has broken his newest toy ! Here is Birmingham, and I must bid you farewell. Perhaps you will open the door for me ? Good-morning : you have made my journey pleasant, and relieved my ennui. I shall be happy to see you in town, and to help you forward in your career.'

And with these words, said in a strange, indifferent, matter-of-fact tone, as of one accustomed to all the polite offers of good society, which mean nothing tangible, she was lifted from the carriage by a train of servants, and borne off the platform.

I looked at the card which she placed in my hand, and read the address of 'Mrs Arden, Belgrave Square.'

I found my friend waiting for me ; and in a few moments was seated before a blazing fire in a magnificent drawing-room, surrounded with every comfort that hospitality could offer or luxury invent.

'Here, at least, is happiness,' I thought, as I saw the family assemble in the drawing-room before dinner. 'Here are beauty, youth, wealth, position—all that makes life valuable. What concealed skeleton can there be in this house to frighten away one grace of existence ? None—none ! They must be happy ; and oh ! what a contrast to that poor lady I met with to-day ; and what a painful contrast to myself !'

And all my former melancholy returned like a heavy cloud upon my brow ; and I felt that I stood like some dead ghost in a fairy-land of beauty, so utterly out of place was my gloom in the midst of all this gaiety and splendour.

One daughter attracted my attention more than the rest. She was the eldest, a beautiful girl of about twenty-three, or she might have been even a few years older. Her face was quite of the Spanish style—dark, expressive, and tender ; and her manners were the softest and most bewitching I had ever seen. She was peculiarly attractive to an artist, from the exceeding beauty of feature, as well as from the depth of expression which distinguished her. I secretly sketched her portrait on my thumb-nail, and in my own mind I determined to make her the model for my next grand attempt at historical composition—'the Return of Columbus.' She was to be the Spanish queen ; and I thought of myself as Ferdinand ; for I was not unlike a Spaniard in appearance, and I was almost as brown.

I remained with my friend a fortnight, studying the midnight effects of the iron-foundries, and cultivating the acquaintance of Julia. In these two congenial occupations the time passed like lightning, and I woke as from a pleasant dream, to the knowledge of the fact, that my visit was expected to be brought to a close. I had been asked, I remembered, for a week, and I had doubled my furlough. I hinted at breakfast, that I was afraid I must leave my kind friends to-morrow, and a general regret was expressed, but no one asked me to stay longer ; so the die was unhappily cast.

Julia was melancholy. I could not but observe it ; and I confess that the observation caused me more pleasure than pain. Could it be sorrow at my departure ? We had been daily, almost hourly, companions for fourteen days, and the surmise was not unreasonable. She had always shewn me particular kindness, and she could not but have seen my marked preference for her. My heart beat wildly as I gazed on her pale cheek and drooping eyelid ; for though she had been always still and gentle, I had never seen—certainly I had never noticed—such evident traces of sorrow, as I saw in her face to-day. Oh, if it were for me, how I would bless each pang which pained that beautiful heart !—how I would cherish the tears that fell, as if they had been priceless diamonds from the mine !—how I would joy in her grief and live in her despair ! It might be that out of evil would come good, and from the deep desolation of my unsold 'Body' might arise the heavenly blessedness of such love as this ! I was intoxicated with my hopes ; and was on the point of making a public idiot of myself, but happily some slight remnant of common-sense was left me. However, impatient to learn my fate, I drew Julia aside ; and, placing myself at her feet, while she was enthroned on a luxurious ottoman, I pretended that I must conclude the series of lectures on art, and the best methods of colouring, on which I had been employed with her ever since my visit.

'You seem unhappy to-day, Miss Reay,' I said abruptly, with my voice trembling like a girl's.

She raised her large eyes languidly. 'Unhappy ? no, I am never unhappy,' she said quietly.

Her voice never sounded so silvery sweet, so pure and harmonious. It fell like music on the air.

'I have, then, been too much blinded by excess of beauty to have been able to see correctly,' I answered. 'To me you have appeared always calm, but never sad ; but to-day there is a palpable weight of sorrow on you, which a child might read. It is in your voice, and on your eyelids, and round your lips ; it is on you like the moss on the young rose—beautifying while veiling the dazzling glory within.'

'Ah ! you speak far too poetically for me,' said Julia, smiling. 'If you will come down to my level for a little while, and will talk to me rationally, I will tell you my history. I will tell it you as a lesson for yourself, which I think will do you good.'

The cold chill that went to my soul ! Her history ! It was no diary of facts that I wanted to hear, but only a register of feelings—a register of feelings in which I should find myself the only point whereto the index

was set. History! what events deserving that name could have troubled the smooth waters of her life?

I was silent, for I was disturbed; but Julia did not notice either my embarrassment or my silence, and began, in her low, soft voice, to open one of the saddest chapters of life which I had ever heard.

'You do not know that I am going into a convent?' she said; then, without waiting for an answer, she continued: 'This is the last month of my worldly life. In four weeks, I shall have put on the white robe of the novitiate, and in due course I trust to be dead for ever to this earthly life.'

A heavy, thick, choking sensation in my throat, and a burning pain within my eyeballs, warned me to keep silence. My voice would have betrayed me.

'When I was seventeen,' continued Julia, 'I was engaged to my cousin. We had been brought up together from childhood, and we loved each other perfectly. You must not think, because I speak so calmly now, that I have not suffered in the past. It is only by the grace of resignation and of religion, that I have been brought to my present condition of spiritual peace. I am now five-and-twenty—next week I shall be six-and-twenty: that is just nine years since I was first engaged to Laurence. He was not rich enough, and indeed he was far too young, to marry, for he was only a year older than myself; and if he had had the largest possible amount of income, we could certainly not have married for three years. My father never cordially approved of the engagement, though he did not oppose it. Laurence was taken partner into a large concern here, and a heavy weight of business was immediately laid on him. Youthful as he was, he was made the sole and almost irresponsible agent in a house which counted its capital by millions, and through which gold flowed like water. For some time, he went on well—to a marvel well. He was punctual, vigilant, careful; but the responsibility was too much for the poor boy: the praises he received, the flattery and obsequiousness which, for the first time, were lavished on the friendless youth, the wealth at his command, all turned his head. For a long time, we heard vague rumours of irregular conduct; but as he was always the same good, affectionate, respectful, happy Laurence when with us, even my father, who is so strict, and somewhat suspicious, turned a deaf ear to them. I was the earliest to notice a slight change, first in his face, and then in his manners. At last the rumours ceased to be vague, and became definite. Business neglected; fatal habits visible even in the early day; the frightful use of horrible words which once he would have trembled to use; the nights passed at the gaming-table, and the days spent in the society of the worst men on the turf—all these accusations were brought to my father by credible witnesses; and, alas! they were too true to be refuted. My father—Heaven and the holy saints bless his gray head!—kept them from me as long as he could. He forgave him again and again, and used every means that love and reason could employ to bring him back into the way of right; but he could do nothing against the force of such fatal habits as those to which my poor Laurence had now become wedded. With every good intention, and with much strong love for me burning sadly amid the wreck of his virtues, he yet would not refrain: the Evil One had overcome him; he was his prey here and hereafter. O no—not hereafter!' she added, raising her hands and eyes to heaven, 'if prayer, if fasting, patient vigil, incessant striving, may procure him pardon—not for ever his prey! Our engagement was broken off; and this step, necessary as it was, completed his ruin. He died'—Here a strong shudder shook her from head to foot, and I half rose, in alarm. The next instant she was calm.

'Now, you know my history,' continued she. 'It is

a tragedy of real life, which you will do well, young painter, to compare with your own!' With a kindly pressure of the hand, and a gentle smile—oh! so sweet, so pure, and heavenly!—Julia Reay left me; while I sat perfectly awed—that is the only word I can use—with the revelation which she had made both of her history and of her own grand soul.

'Come with me to my study,' said Mr Reay, entering the room; 'I have a world to talk to you about. You go to-morrow, you say. I am sorry for it; but I must therefore settle my business with you in good time to-day.'

I followed him mechanically, for I was undergoing a mental castigation which rather disturbed me. Indeed, like a young fool—as eager in self-reproach as in self-glorification—I was so occupied in inwardly calling myself hard names, that even when my host gave me a commission for my new picture, 'The Return of Columbus,' at two hundred and fifty pounds, together with an order to paint himself, Mrs Reay, and half-a-dozen of their children, I confess it with shame, that I received the news like a leaden block, and felt neither surprise nor joy—not though these few words chased me from the gates of the Fleet, whither I was fast hastening, and secured me both position and daily bread. The words of that beautiful girl were still ringing in my ears, mixed up with the bitterest self-accusations; and these together shut out all other sound, however pleasant. But that was always my way.

I went back to London, humbled and yet strengthened, having learned more of human nature and the value of events, in one short fortnight, than I had ever dreamed of before. The first lessons of youth generally come in hard shape. I had sense enough to feel that I had learned mine gently, and that I had cause to be thankful for the mildness of the teaching. From a boy, I became a man, judging more accurately of humanity than a year's ordinary experience would have enabled me to do. And the moral which I drew was this: that under our most terrible afflictions, we may always gain some spiritual good, if we suffer them to be softening and purifying rather than hardening influences over us. And also, that while we are suffering the most acutely, we may be sure that others are suffering still more acutely; and if we would but sympathise with them more than with ourselves—live out of our ourselves, and in the wide world around us—we would soon be healed while striving to heal others. Of this I am convinced: the secret of life, and of all its good, is in love; and while we preserve this, we can never fail of comfort. The sweet waters will always gush out over the sandiest desert of our lives while we can love; but without it—nay, not the merest weed of comfort or of virtue would grow under the feet of angels. In this was the distinction between Mrs Arden and Julia Reay. The one had hardened her heart under her trials, and shut it up in itself; the other had opened hers to the purest love of man and love of God; and the result was to be seen in the despair of the one and in the holy peace of the other.

Full of these thoughts, I sought out my poor lady, determined to do her real benefit if I could. She received me very kindly, for I had taken care to provide myself with a sufficient introduction, so as to set all doubts of my social position at rest: and I knew how far this would go with her. We soon became fast friends. She seemed to rest on me much for sympathy and comfort, and soon grew to regard me with a sort of motherly fondness that of itself brightened her life. I paid her all the attention which a devoted son might pay—humoured her whims, soothed her pains; but insensibly I led her mind out from itself—first in kindness to me, and then in love to her grandson.

I asked for him just before the midsummer holidays, and with great difficulty obtained an invitation for him

to spend them with her. She resisted my entreaties stoutly, but at last was obliged to yield; not to me, nor to my powers of persuasion, but to the holy truth of which I was then the advocate. The child came, and I was there also to receive him, and to enforce by my presence—which I saw without vanity had great influence—a fitting reception. He was a pensive, clever, interesting little fellow; sensitive and affectionate, timid, gifted with wonderful powers, and of great beauty. There was a shy look in his eyes, which made me sure that he inherited much of his loveliness from his mother; and when we were great friends, he shewed me a small portrait of 'poor mamma,' and I saw at once the most striking likeness between the two. No human heart could withstand that boy, certainly not my poor friend's. She yielded, fighting desperately against me and him, and all the powers of love, which were subduing her, but yielding while she fought; and in a short time the child had taken his proper place in her affections, which he kept to the end of her life. And she, that desolate mother, even she, with her seared soul and petrified heart, was brought to the knowledge of peace by the glorious power of love.

Prosperous, famous, happy, blessed in home and hearth, this has become my fundamental creed of life, the basis on which all good, whether of art or of morality, is rested: of art especially; for only by a tender, reverent spirit can the true meaning of his vocation be made known to the artist. All the rest is mere imitation of form, not insight into essence. And while I feel that I can live out of myself, and love others—the whole world of man—more than myself, I know that I possess the secret of happiness; ay, though my powers were suddenly blasted as by lightning, my wife and children laid in the cold grave, and my happy home desolated for ever. For I would go out into the thronged streets, and gather up the sorrows of others, to relieve them; and I would go out under the quiet sky, and look up to the Father's throne; and I would pluck peace, as green herbs from active benevolence and contemplative adoration. Yes; love can save from the sterility of selfishness, and from the death of despair: but love alone. No other talisman has the power; pride, self-sustainment, coldness, pleasure, nothing—nothing—but that divine word of Life which is life's soul!

POPULAR MUSIC—MAINZER.

In our days, vocal music is beginning to assert in this country the place it has long held abroad as a great moral educator; no longer regarded as a superfluity of the rich, it is now established as a branch of instruction in almost every school, and is gradually finding its way into many nooks and corners, where it will act as an antidote to grosser pleasures, by supplying the means of an innocent and elevating recreation.

The apostle of music, considered as a boon and privilege of 'the million,' has lately passed away from the scene of his active labours; and it is but a tribute due to his memory as a philanthropist and man of genius, while we deplore his loss, to pause for a moment and briefly trace his career.

Joseph Mainzer was born, on the 21st October 1801, at Trèves, of parents in the middle rank of life. When quite a child, the predominating taste of his life was so strongly developed, that in spite of harsh masters he learned to play on the piano, violin, bassoon, and several wind-instruments; and at the age of twelve could read at sight the most difficult music, and even attempted composition. Music, however, was not intended to be his profession, and was only carried on as a relaxation from the severer studies to which Mainzer devoted himself at the university of Trèves, where he

took the highest degree in general merit, and the first prize for natural science. At the age of twenty-one, he left college to descend into the heart of the Saarbruck Mountains as an engineer of mines, where, according to custom, he had to commence with the lowest grade of labour, and for months drag a heavy wheel-barrow, and wield the pickaxe. Yet here, in reality, dawned his mission as the apostle of popular music: he relieved the tedium of those interminable nights of toil—for days there were none—by composing and teaching choruses, thus leading the miners both in labour and in song. This underground life, however, was too severe for his constitution; and he was obliged to return home in impaired health. He now studied divinity and music; and, after a time, was advised to travel in order to perfect himself in the latter branch of art. Under Rinck at Darmstadt, and at Vienna and Rome, he enjoyed every advantage; and, on leaving the Eternal City, was invited to a farewell *fête* by Thorwaldsen, where all the eminent artists of the day were present, and joined in singing his compositions. On returning home, after two years' absence, he adopted music as his vocation, and published his first elementary work—the *Singschule*, which was introduced in Prussia and Germany as the *methode* in schools; and soon after, the king of Prussia sent him the gold medal awarded to men eminent in the arts and sciences. Paris, however, soon offered more attractions to Mainzer than his native place, and thither he repaired and pitched his tent for ten years. During this period, he established his reputation as a composer of dramatic, sacred, and domestic music, and as an acute and elegant writer and critic. His opera of *La Jacquerie* had a run of seventeen nights consecutively at the theatre. He was soon welcomed into the literary and artistic circles of Paris; and one evening, at an elegant *réunion*, being invited to play, he *improvised* a piece, which was taken for a composition of Palestrina's. Many were moved to tears, one pair of pre-eminently bright eyes especially; and the consequence was, that the composer and the bright eyes were soon after united in marriage!

But amid these captivating *salons* and congenial occupations, what had become of the apostle of popular music? He was not asleep; only digesting and preparing a system which should, by its simplicity and clearness, bring scientific music within the reach of the humblest as well as the highest classes of society. At last it was matured, and the working-classes were invited to come and test it—gratuitously of course. A few accepted the invitation; but their success and delight in the new art thus opened up to them, was so great, that the 'two or three' pioneers soon swelled into an army of 3000 *ouvriers*! But a band of 3000 workmen in Paris was considered dangerous: it could not be credited that they met merely for social improvement and relaxation; some political design must surely lurk under it: government was alarmed, the police threatened; and it was left to Mainzer's choice either to remain in Paris without his artisan classes, or to seek elsewhere a field for his popular labours. He decided at once on the latter alternative, and departed for England, amidst the heartfelt regrets of those whom he had attached so strongly to himself, while he inculcated peace, order, and every social virtue. On his revisiting Paris long after, his old pupils serenaded him unmolested; and in 1849, the Institute of France voluntarily placed his name on their list for the membership

vacant by the death of Donizetti; yet he would not accept the proposal of a later French government to return and establish his system: he preferred the freedom of action which he enjoyed in Britain.

In London, a period of arduous labour commenced. Mainzer arrived without patronage, without the *prestige* that his name had earned abroad, and, what was a greater drawback, without any knowledge of English! But, nothing daunted, with his usual energy he set about the task of acquiring the language, which he did in an incredibly short time—commencing, like a child, by naming all familiar objects, and going on, until, without perplexing himself with rules or their exceptions, he had acquired facility enough to lecture in public. His work on *Music and Education* shews with what force and purity of style he could afterwards write in English. It was the same principle—that of commencing with practice and letting theory follow—which he carried out in his system of 'Singing for the Million.' He argued, that as children learn to speak before they can read or construct language grammatically, so they ought to be taught vocal music in such a way as to introduce the rules of harmony gradually, and prepare them for the manipulation of an instrument, if it is intended they should learn one; while for the great masses of both children and adults, the voice is the best and only instrument, and one that can be trained, with very few exceptions, to take part in choral, if not in solo singing, and at the same time be made a powerful and pleasing agent in moral culture. On this subject, we shall quote Dr Mainzer's own words, when speaking of the compositions introduced into his classes, he says: 'Besides religious compositions, there are others, which refer to the Creator, by calling attention to the beauty and grandeur of his works. Songs, shewing in a few touching lines the wondrous instinct of the sparrow, the ant, the bee, and cultivating a feeling of respect for all nature's children. Besides these, there are songs intended to promote social and domestic virtues—order, cleanliness, humility, contentment, unity, temperance, &c.; thus impressing, not the letter of the law of charity on immature minds, but the spirit of it in the memory, and so identifying them with the very fibres of the heart.'

With such views and principles, Mainzer arrived in England, to propagate his humanising art; and London soon became the centre of a series of lectures and classes, held in the principal towns accessible by railway—such as Brighton, Oxford, Reading, &c. But this divided work was not satisfactory, and the national schools and popular field in London were preoccupied by Hullah, who had some time previously introduced Wilhelm's system, under the sanction of government. There was room and to spare, however, for every system, and Mainzer wished every man good-speed who advanced the cause; but as a fresh field for his own exertions, after two years spent in England, he turned his thoughts towards Edinburgh, where he had been invited by requisition, and warmly received in 1842.

On his return to Scotland, he found his cause somewhat damaged in his absence, by the attempt of precentors to teach his system in congregational classes. Unlike the church-organists of England, the Scotch precentors are not educated musicians—a naturally good voice and ear is their only pre-requisite. Dr Mainzer soon repaired this mistake in those congregations which invited his personal superintendence; and in one church (Free St Andrew's) the good effects of his system are still to be heard, in a congregation forming their own choir, and singing in *four parts*.

To restore this country to the standard of musical eminence which we know from old authorities that it held in the sixteenth century, was the object of Dr Mainzer's energetic endeavours. The elements, he believed, were not wanting. In Scotland, the musical

capacity of the people he found to be above rather than below the average of other nations: all that was wanting was to convince the people of this by the cultivation of their neglected powers. As a preliminary step, he excited those friendly to the object to found the 'Association for the Revival of Sacred Music in Scotland,' of which he was the director and moving spring; and under its auspices he commenced a course of *gratuitous* teaching to classes formed of pupils from the parish and district schools of Edinburgh, precentors, teachers, and operatives. The success of these normal classes was so great and so rapid, that at the end of the first year the pupils were able to become teachers in their turn in their own schools or homes; and at the close of the second and third sessions, concerts and rural fêtes were held, at which many hundreds of young voices joined in giving true and powerful expression to such works of the great masters as *Judas Maccabæus*; while for the delight of their parents' firesides, and their own moral improvement, the children carried home with them those simple but touching and expressive melodies, composed by Mainzer for their use. At the same time, Mr Mainzer carried on classes for the upper ranks, especially for young children; gave lectures on the history of music from the earliest times and in all countries; and published a talented work on *Music and Education*, of which very favourable reviews appeared at the time.* Mainzer had a peculiar predilection for Scotland: its scenery, its history, its music, all supplied food for his various tastes. With a poetic appreciation of the beauties of nature, he desired no greater pleasure than to wander in perfect freedom among our lochs and hills; and his descriptions of Edinburgh, the Highlands, and Western Islands, which appeared in the *Augsburg Gazette*, have brought some and inspired more with the wish to visit the Switzerland of Britain. The history and music of Scotland threw fresh light upon each other under his researches. He delighted to trace the reciprocal influence of national events and national music, from the time of the Culdee establishments of the sixth century, when 'Iona was the Rome of the north,' down to the *Covenanters' Lament*, and the Jacobite songs of the last century. Since these days, the spirit that invented and handed down popular song has passed away with the national and clanish feuds which gave rise to the gathering song and the lament. The age of peace has been heralded in by the songs of Burns and Lady Nairne, the authoress of *The Land o' the Leal*, who has done much to restore the taste for our beautiful old melodies, by wedding them to pure and appropriate verse.†

In such pursuits, Mainzer—by this time dubbed doctor by a German university—passed five years very pleasantly, but, in a worldly point of view, very unprofitably. He had failed on first coming to Edinburgh in obtaining the musical chair, which seemed so appropriate a niche for him; and however reluctant to leave his favourite normal classes and his adopted home, still when he looked to the future, he was compelled to think of leaving Edinburgh—for the German proverb still held true: 'Kunst geht nach brod'; and if man cannot live by bread *alone*, neither can the artist live *without* bread! At this juncture, the Chevalier Neukomm, of European celebrity as a composer and organist, and a valued friend of Dr Mainzer, came to Edinburgh to inspect his friend's normal classes. He was so much delighted with them, and considered Dr Mainzer so little appreciated by the general public, that he persuaded him to try Manchester as his future field of exertion.

In the autumn of 1848, accordingly, Neukomm introduced Mainzer to the leading men of that city, who

* See *Chambers's Journal*, No. 226, New Series.

† See *Lays from Strathearn*, 4to.

received him so cordially, that he at once took his proper position, and entered on a career both useful and profitable, and which continued to be increasingly successful, until at Christmas 1850, he was laid aside by ill-health. Over-exertion had brought on a complication of diseases, to which he was a martyr for ten months, and which terminated fatally on the 10th November 1851. During that long period of intense suffering, his active mind was never clouded nor repining, and at every interval of comparative ease, he read or listened to reading with avidity. During the first months of his illness, he superintended the publication of a new musical work, called *The Orpheon*, two numbers of which appeared; and his last exertion in this way was arranging two songs: *The Sigh* of Charles Swain, and Longfellow's *Footsteps of Angels*, adapted to Weber's last song. Prophetic requiems both!

A few weeks after his death, the hall which had been built in Edinburgh for the classes of the Association which he founded, was opened by an amateur concert given as a tribute to his memory. He had promised to preside on this occasion; but his place was filled by his aged, but still vigorous friend, the Chevalier Neukomm, who had come to Edinburgh, at the request of the Association, to compose a series of psalms, one of which was sung by the pupils. Music for the Psalms, adapted to the varying meaning of each verse, has hitherto been a desideratum in the musical world; now being supplied in Chevalier Neukomm's work, and already subscribed for by no mean judges—the Queen and Prince Albert, the king of Prussia, &c. It was touching, and yet gratifying, to see one of Dr Mainzer's oft-cherished hopes realised for the first time that evening—that of the musical union of accomplished amateurs of private life with the pupils of the normal classes.

Having thus briefly traced Dr Mainzer's life, it now remains to offer a few remarks on his general character. His talents were of a diversified and high order; and those who knew him only as the author of 'Singing for the Million,' were not aware of his general cultivation of mind. In the dead and living languages, he was equally at home: now he would be speculating on the formation of the Greek chorus, and again mastering some dialect of modern Europe, in order to elucidate the history of the people or their music and poetry. His literary articles were sought after by all the leading journals in Germany and Paris; and his volumes of *Sketches of Travel*, and of *The Lower Orders in Paris*, are graphic and entertaining. A year or two ago, a *Notice Bibliographique* of his works appeared in Paris, which contained a list of above thirty publications. Great diligence, joined to enthusiasm, enabled him to accomplish so much in these various departments of literature. His manners, too, were of that frank, cordial, and agreeable tone which inspires confidence, and prepossessed every one in his favour; so that from all he could obtain the information which he wished, and they could afford. Over his pupils, his influence was immense. He had the rare art of engaging the entire attention of children; and while he maintained strict discipline, he gained their warmest affection: his own earnestness was reflected on the countenances of his pupils.

Those alone who knew him in private life could thoroughly estimate that purity of mind and heart which eminently characterised him, along with a child-like simplicity and unworldliness, which often, indeed, made him the prey of designing persons, but which, joined to his general information and cheerfulness, made his society most attractive. His personal appearance was indicative of a delicate and nervous organisation: slight and fragile in figure, with an intellectual forehead and eye, that spoke of the preponderance of the *spirituelle* in his idiosyncrasy; one of those minds which are ever working beyond the powers of the body;

ever planning new achievements and new labours of love, and which too often, alas! go out at noonday, while half their fond projects are unaccomplished, yet not before they have made a name to live, and left the world their debtors!

A NEWCASTLE PAPER IN 1765-6.

THERE is scarcely anything more entertaining and instructive than a leisurely look over an old newspaper file. A newspaper of any age is an attraction, and the current newspaper something more, for it is now a necessity. But the next place to it in point of interest is perhaps due to the journal half a century, or two-thirds of a century old. It introduces us, if we be youthful, to the habits of our grandfathers; and if we be in 'the sere, the yellow leaf,' to the habits of our fathers, more fully than the pleasantest novel or most elaborate essay, and far more intimately than the most correct and complete historical records. It enables us to observe freely the position and avocations of the denizens of the past, and catch hasty, but most suggestive glances at bygone days; it 'shews the very age and body of the time, its form and pressure.' It is a milestone from which we may reckon our progress, and must delight as well as surprise us by the advancement it shews us to have made in social and political life, particularly with regard to those 'triumphs of mind over matter,' for which recent times have been pre-eminently distinguished.

The writer of this article had lately an opportunity of inspecting a file of the *Newcastle Chronicle* for 1765-6, and the contrast between journals and things in general which that examination forced on the attention, was in some respects sufficiently striking or curious to be, in his opinion, deserving of some permanent record. At present, the journal in question almost, if not entirely, reaches 'the largest size allowed by law'; at that time, it consisted merely of a single demy sheet. Now, the Newcastle people would be amazed beyond measure if they did not receive at breakfast-time, on the morning of publication, the parliamentary, and all other important news of the night; then, the latest London news was four days old. But a better idea of the journal can perhaps be given, by stating what it lacked than what it then contained. It had no leaders, no parliamentary reports, and very little indeed, in any shape, that could be termed political news. In these matters, its conductor had to say, with Canning's knife-grinder: 'Story! God bless you, I have none to tell, sir.' Not that the political world was unfruitful in affairs of moment; it was a time of no small change, interest, and excitement. In the period referred to, the Grenville ministry had endeavoured to burden the American colonies, by means of the stamp-duties, with some of the debt contracted in the late war. Thereupon, immense discontent had arisen at home and abroad; that administration had fallen; and the Rockingham ministry, which was then formed, found full employment (in 1766) in undoing what had been effected in the previous year. How the Grafton ministry was next formed; how the unfortunate design of taxing the colonists was revived; and how that policy ended, readers of English history know full well. John Wilkes, too, had been already persecuted into prominence, although not yet forced up to the height of his popularity with the masses. But, notwithstanding these and other stirring incidents, the *Chronicle* was, politically speaking, almost a blank. From time to time, it was stated that the royal assent had been given to certain measures; but concerning the preparation and discussion of those measures, nothing was known. A few other political facts of interest, indeed, such as the arrival of Wilkes in London from France; the repeal of the obnoxious Stamp Act; the riots of the Spitalfields weavers on account of the importation of French silks; and an attack upon the

Speaker, and many of the members of the Dublin parliament, who were grossly insulted, and kept from going to the House, in consequence of 'a report that parliament designed to impose more taxes,' were also curiously noticed. Political rumours abounded, although positive knowledge of that kind was exceedingly scanty; and the little that could be obtained was eked out by innuendo, rather than by venturing on any direct statement. The familiarity which, according to the proverb, is apt to breed contempt, was not then indulged in with reference to rulers, parliaments, or even agitators. The emperor of Russia was alluded to under the title of 'a great northern potentate;' parliament was spoken of as 'a certain august assembly;' and Wilkes was usually entitled, 'a certain popular gentleman.'

Some of the political rumours are worthy of republication. The subjoined, from the London news of July 29, 1766, serves to shew how long a political change may be mooted before its effect is tried in this country: 'It is said, a bill will be brought into parliament next session, binding elections for members of parliament to be by ballot.'

And, without at all entering into the discussion of political topics, it may perhaps be observed that the following, taken from the *Chronicle* of August 10, 1765, points out how an evil of the present day has long been felt and acknowledged: 'We hear the electors of a certain borough have been offered 8000 guineas for a seat, though there is but so short a time for the session of the present parliament.'

Great surprise is expressed (1766) that the consumption of coal in London 'hath increased from 400,000 odd to 600,000 chaldrons yearly.' We find that the coal imported into London during the first six months of 1761, amounted to 1,527,527 tons, besides 90,975 tons brought into the metropolis during the same period by railway and canal. 'Carrying coal to Newcastle' proved a successful speculation on September 25, 1765, when, on account of a strike among the pitmen, 'several pokes of coal were brought to this town by one of the common carriers, and sold on the Sandhill for 9d. a poke, by which he cleared 6d. a poke.' About the same time, wheat was selling in Darlington and Richmond for 4s. and 4s. 6d. per bushel, after having been nearly double that price only two or three weeks previously. In the number for June 25, 1766, we have the following quotation from a Doncaster letter:—'Corn sold last market-day from 12s. to 14s. per quarter; meat, from 2½d. to 8d. per pound; fowls, and other kinds of poultry, had no price, being mostly carried home. I wish a scheme was set on foot, to run many such articles to London by land-carriage; there is plenty here.' In the same paper, the prices of grain in London are given: wheat, 86s. to 41s.; barley, 22s. to 25s.; oats, 16s. to 20s.

Recently, the Newcastle papers, led on by the *Chronicle*, have been making strenuous efforts to extend the French coal-trade, but such exertions formed no part of the 'wisdom of our ancestors.' The number for June 15, 1765, informs us that 'some sinister designs for exporting a very considerable quantity of coals to France and elsewhere, have lately been discovered and prevented.' Sturdy Britons had then far too much hatred for 'our natural enemies' to wish to exchange aught but hostilities with them. About the same time, we learn that 'clubs of young gentlemen of fortune' had come to the magnanimous resolve, 'to toast no lady who has so much inconsideration as to lavish her money away in French fopperies, to the detriment of her own country.'

The style of advertising then in vogue occasionally gave the paper a somewhat pictorial appearance. Cock-fighting was in great force, and the public announcements relative to this barbarous sport were invariably headed by a portraiture of a couple of game-birds facing each other with a most belligerent aspect; while the numerous advertisements of horses 'stolen or strayed,'

were embellished by a representation of the supposed thief, mounted on the missing animal, which was forced into a breakneck pace, while Satan himself, in *propria persona*, was perched on the crupper, in an excited and triumphant attitude. In the local paragraphs, we note several indicating a strong feeling of animosity between the Scotch and English borderers. We observe also that the Newcastle dogs—to this day a very numerous fraternity—were at times quite unmanageable, and caused, either by their ravenous exploits, or their downright madness, no small uneasiness to the town and neighbourhood. It must be confessed, that in its marriage-notices, at least, the *Chronicle* was far superior to anything that journalism can now exhibit in Newcastle or in Great Britain. These interesting announcements must have intensely delighted our grandmothers; and, we fear, have frequently tempted our grandfathers into a somewhat precipitate plunge into the gulf of matrimony. Instead of barely specifying, as papers now do, that Mr Smith married Miss Brown, the *Chronicle* uniformly tantalised its bachelor readers with an account of the personal, mental, and, if such there were, metallic charms of the bride; so that how any single gentleman, in the teeth of such notifications, could retain his condition for long, is really marvellous. Most of the young ladies who had thus bestowed themselves on their fortunate admirers, are described as 'sprightly,' and many as 'genteel and agreeable;' some have 'a genteel fortune,' others 'a considerable fortune,' and others, again, rejoice in the possession of 'a large fortune:' one man gains 'a well-accomplished young lady, with a fortune of L.1000;' another takes unto himself 'an agreeable widow lady, with a fortune of L.2000;' a third marches off with 'a young lady endowed with every accomplishment to make the marriage state happy, with a fortune of L.5000;' while a fourth *Benedict*, more lucky still, obtains 'a most amiable, affable, and agreeable young lady, with a fortune of L.10,000.' We suppose that the best excuse newspaper editors now have for being less florid in their matrimonial announcements is, that where the papers formerly had one, they have now at least a dozen of these interesting notices; so that their brevity may be less owing to the want of gallantry than to the want of space.

So extremely meagre was the news, both foreign and domestic, that a considerable portion of the four small pages of the *Chronicle* was usually devoted to literature. Extracts were frequently given from the works of Johnson, Smollett, and other popular writers, and a column was often occupied by an essay from a contributor to the paper, generally treating of some social evil or peculiarity, but never intermeddling with local or general politics. These effusions displayed a very respectable amount of ability, and the general getting-up, or what would now be termed the sub-editing of the paper, was also performed with care and ability. The scraps of news were always presented rewritten and carefully condensed, instead of the loose 'scissors-and-paste' style of publication adopted by many provincial papers of the present day. Notices not only of local theatricals, but of histrionic matters at Old Drury, were occasionally given; the number for March 15, 1766, containing a well-written criticism of '*The Clamdestine Marriage*;' a *New Comedy*, performed there. As the *Chronicle* thus had to leave politics for literature, we may perhaps, in our turn, digress from a consideration of its pages, to note briefly that this period was set in the very midst of the celebrated Georgian era, in which this country could boast of more distinguished men—especially in literature—than at any other period. In about twenty previous years, many great ones had departed—notably Pope, Thomson, Fielding. Richardson also had died in 1761, and Shenstone in 1763; the author of the *Night-Thoughts* survived till 1765, when his burial was announced in the *Chronicle* of April 27.

At this time (1765-6), Dr Johnson had reached the zenith of his fame; Gray was becoming popular; Smollett had written most of his novels; Goldsmith was about to present the world with his exquisite *Vicar of Wakefield*; Gibbon had returned to England from Rome with the idea of *The Decline and Fall* floating in his brain; Thomas Chatterton,

— 'the marvellous boy,
The sleepless soul that perished in his pride,'

had already given proofs of his wondrous precocity; the genuine sailor-poet, Falconer, had lately published *The Shipwreck*; Laurence Sterne had just collected the materials for his *Sentimental Journey*; Sir William Blackstone had published his celebrated *Commentaries*; Wesley and Whitefield had not yet ended their useful career; the star of Edmund Burke was rising; and Jeremy Bentham, being then (1766) but seventeen years of age, had taken his master's degree at Oxford, although, it is true, the first literary performance of the eccentric philosopher did not appear till some years later. Home, Moore, and Colman, had appeared successfully as dramatists, and were about to be followed by Macklin, Cumberland, Goldsmith, and Sheridan. Newcastle or district celebrities of the time included Mark Akenside, the author of *The Pleasures of the Imagination*; Dr Thomas Percy, dean of Carlisle, who published, in 1765, his *Reliques of English Poetry*; and Dr John Langhorne, a northern divine of no small popularity in his day as a poet. Among other illustrious living men, were Horace Walpole, Henry Mackenzie, Blair, Hume, Adam Smith, Dr Robertson, Garrick, Reynolds; and last, not least, William Pitt, who, in 1766, was created Earl of Chatham.

But let us return to our more immediate purpose—that of making a few selections from the *Chronicle*, some of which will doubtless reflect far less credit on the age than the enumeration we have just made of eminent individuals. Now and then, a duel took place in Hyde Park. The amusements of some of our aristocrats did not always exhibit them in any very dignified position, as witness the subjoined:—'Sir Charles Bunbury ran 100 yards at Newmarket for 1000 guineas, against a tailor with 40 lb. weight of cabbage, *alias* shreds.'

Here is a paragraph, from the number for March 15, 1766, relative to the recreations of some less elevated in the social scale: 'Sunday morning, a little before three o'clock, a match at marbles was played under the piazza at Covent Garden by the light of thirty-two links (by several rogues well known in that circle), for twenty guineas a side.'

A few other quotations may be deemed worthy of republication, although some of them may have no direct or important bearing. The audacity of highway robbers at this period is known to everybody. The following, dated December 21, 1765, gives a tolerably correct idea of the usual style adopted by those gentlemen of the road:—'Thursday, the Leeds and Leicester stage-coaches were stopped on Finchley Common by a highwayman, who took from the passengers a considerable sum of money. A nobleman's cook, a young woman about twenty-five, declared she would not be robbed, when the highwayman, admiring her courage, let her alone. He broke the coach-glass with his pistol, and gave the coachman half-a-crown to get it mended.' News from London, dated January 9, 1766, says: 'Early on Tuesday morning, a member of parliament, on his return home in a chair to his house in New Palace Yard, was stopped and robbed by a single footpad of his purse, in which were sixty-three guineas.'

About the same time, we are informed that 'the celebrated J. J. Rousseau hath for the present taken up his residence at a friend's house in Putney.'—The number for October 26, 1765, contains an advertisement of a 'beggars' stand' (copied from the *Public*

Advertiser), 'to be let, in a charitable neighbourhood. Income, about 80s. a week.'

The following reference to our acquaintances, the Sikhs, now sufficiently well known, is curious, as it is doubtless one of their first appearances in the columns of the English press. It is dated July 5, 1766: 'The Seyques, an idolatrous people inhabiting the neighbourhood of Cachemire, whose name was hardly known two years ago, have beaten Abdaly and the Patanes whom he commanded.' Modern Cockneys would stare to read a paragraph like this: 'A great deal of grass hath been cut down about Islington, Kentish-Town,' &c.

We will conclude our selections, which have now grown quite desultory and miscellaneous, by the brief obituary of a 'remarkable' man, from the *Chronicle* of July 26, 1766: 'Thursday, died at his house near Hampstead, the Rev. Mr Southcote, remarkable for having a leg of mutton every night for supper during a course of forty years, smoking ten pipes as constantly, and drinking three bottles of port.'

GENIUS FOR EMIGRATION.

LADY E. STUART WORTLEY, in the account of her journey in America, mentions that she saw a man proceeding on foot across the Isthmus of Panama, bound for the Pacific, carrying a huge box on his back that would almost have contained a house. It was really a dreadful thing to see the poor man, full-cry for California, toiling along with his enormous burden, under a tropical sun, the heat of which he required to endure through forty miles of wilderness, and no chance of relief or refreshment by the way. Yet this serio-comic spectacle is not singular. Multitudes seem to have gone to the diggings with every species of encumbrance, and in a totally unsuitable garb. Splendid dress-coats and waistcoats, boots and pantaloons, but no working-clothes, nor implements for camping, and in many instances not even a cloak: everything suitable for the enjoyment of their golden promises, with nothing to assist in realising them.

Nearly the same thing has occurred in innumerable instances as regards Australia. The men going thither must in general be shepherds or their masters; and to be either to any purpose, they must go far into the bush. For this they required a talent for constructing huts for themselves and servants, and hurdles for the cattle, and consequently tools to assist them; but they often went without either tools or talents, and so had to pay extravagantly for very common services. They may have had common clothes, but they had made no provision for living far from the assistance of women; and consequently, if a coat-sleeve was torn, it must hang just as it was; if a stocking was out at heel, having neither needles nor worsted, nor the power of using them, they had no other resource but to tie the hole together. They had no idea of washing and dressing, and consequently must want clean linen, or stockings, and every other article of clean apparel, till a woman could be heard of, and bribed to assist them. The consequence was, that it was cheaper to buy new articles than either wash or mend the old. It is doubtful whether many had not omitted to learn to shave themselves, or to provide razors or strops, or even scissors.

Then as to baking bread, or cooking the humblest meal, they were equally at a loss. They seem to have had no idea of the humblest grate, or even of a flat and easily-cleaned stone for a hearth; and so, having kneaded their 'damper,' it is never said how they thrust it in the ashes till it was partially heated, and

comparatively fit to be eaten. They have mutton, and mutton only; but how cooked is equally unknown. It is not known that they have any apparatus whatever, stew or frying pan, or even a hook and string. Yet the natives of Scotland may have seen many things nicely baked by means of a hot hearthstone below, a griddle with live coals above, and burning turf all round. A single pot with water is a boiler; with the juice of the meat, or little more, a stew-pan; or merely surrounded by fire, an oven: but it is believed many have not that single pot. Even the cheap crock that holds salted meat might also be turned into a pudding-dish; and such a vessel as that which of old held the ashes of the dead, and now occasionally holds salt, the French peasant often turns into a *pot-au-feu*—a pot for boiling his soup—and makes that soup out of docks and nettles collected by the wayside, with a little meal—delicious if seasoned with salt and a scrap of meat, or a well-picked lark or sparrow, or even a nicely-skinned and washed thigh of a frog!

The natives of New Holland themselves get fat upon serpents well-killed—that is, with the heads adroitly cut off, so as not to suffer the poison to go through the body; or upon earth or tree worms nicely roasted. The Turks roast their *kebabs*—something near to mutton-chops—by holding them to the fire on skewers. But the inhabitants of Great Britain, accustomed to comforts unknown to any other part of the world, are, when deprived of these comforts, the most helpless in the world.

The natives of Ireland might be supposed to be excellent subjects for emigration, for at home they have often only straw and rags for beds, stones for seats, and one larger in the middle for a table; while the basket or 'kish' that washes the potatoes, receives them again when boiled: so that the pot and basket are the only articles of furniture. Simplicity beyond this is hardly conceivable: there is but one step beyond it—wanting the pot, and throwing the potatoes, however cooked, broadcast upon the stone-table; and this is possible by roasting the potatoes in the embers. The Guachos of South America teach how even the most savoury meal of beef may be obtained without pot or oven—namely, by roasting it in the skin! It is called *carne-con-cuero*—flesh in the skin—and is pronounced delicious. Diogenes threw away his dish, his only article of furniture, upon seeing a boy drink from his hand; and after this example, an Irishman might throw away his pot; though we would not recommend him to do so.

Unless people know how to prepare food, they may starve in the midst of comparative plenty. It is alleged—though we do not vouch for the fact—that when wheat and maize were carried into Ireland and given gratis, the famine was not stayed. Though they had the wheat and maize, they could not grind them; if ground, they could not cook them—they had neither vessels nor fuel; if vessels and fuel were given, they were still unable to assist themselves—they had not skill to cook them; and if cooked, they could not eat them—they had never been accustomed to do so! Such are the effects of carrying contentment too far: the individual becomes wholly resourceless.

We try to induce them to fish with the same results. If we give them boats, they have no nets; give them nets, they know not how to use them; teach them to use them, and they can neither cook nor eat the fish; and as to selling them for other comforts, there is no market! Without a knowledge of agriculture, or fishing, or even talents to feed themselves, such men are useless in any quarter, unless as subjects to be taught; and now at last, but greatly too late, they are being taught, and the much-abused railway will carry their produce to the market.

The Scottish Celt is more shifty. In the old days when he had flesh and little else to eat, he could broil it on the coals; and a Scotch collop is perhaps equal to

a Turkish kebob. We wonder if in Australia the long-forgotten Scotch collop has been revived? It requires no cooking-vessels. It may be held to the fire on a twig, or laid on the coals and turned by a similar twig—bent into a collop-tongs—or even by the fingers.

In the Rebellion of 1745, the Scots-Celt could knead into a cake the meal, which he carried as his sole provision, and knew that it ought to be fired upon a griddle; but if he had no other convenience, he could knead it in his bonnet, and eat it raw, and go forth to meet and conquer the best-appointed soldiers in Europe. It was only when at last he had neither rest nor food that he was dispersed—not conquered. A lowland Scot is better. With a dish and hot water, and of course the meal and salt, he can make *brose*, and live and thrive upon it.

How John Bull, who in his own country is carnivorous, and will have his roast-pig on Sunday, if he should slave all the week—how he gets on in a new country, is more doubtful. Very likely, having more wants, he makes more provision for them; but as below a certain rank he is not a writing animal, less is known of his successes or difficulties. For our own part, we think we would have made an excellent Crusoe, and your Crusoe is the only man for a new country.

Some years ago, we travelled over the backbone of Scotland, and returned somewhat on its western fin, both on foot; and all our equipments were a travelling dress, a stout umbrella, and a parcel in wax-cloth strapped on our left shoulder, not larger than is generally seen in the hands of a commercial traveller—that is, twelve inches by six or eight; and yet we never wanted for anything. It is true we had generally the convenience of inns by the way; but if by our *Traveller's Guide* (which we also carried) we saw the stage was to be long, an oaten cake, with a *plug* of wheaten bread for the last mouthful, to keep down heartburn, and a slice of cold beef or ham, or a hard-boiled egg, were ample provisions. Drink? There was no lack of drink. Springs of the most beautiful water were frequent by the roadside, and constantly bubbling up, without noise or motion, through the purest sand, though heaven only was looking upon them; and a single leaf from our memorandum-book, formed into the shape of a grocer's twist as wanted, served us as a drinking-cup throughout the journey. Had we even been overtaken by night, it was summer, and a bed under whins, or upon heather, with our umbrella set against the wind, and secured to us, would have been delightful. Once, indeed, we feared this would have been our fate; for on the very top of Corryarrick, and consequently nine miles or more from house or home in any direction, we sprained our ankle, or rather an old sprain returned. To all appearance, we were done for, and might have sat stiff for days or weeks by the solitary spring that happened to be near at the instant. But a piece of flannel from the throat, and a tape from the wondrous parcel, enabled us again to wag; and we finished our allotted journey to Dalwhinnie in time for dinner, tea, and supper in one—and then to our journal with glorious serenity!

Our arrangements for the continent were equally simple. When we were asked to shew our luggage, on entering France, we produced a portmanteau nine inches by six. 'Voilà ma magasin!' It was opened, and there were certainly some superfluities, though natural enough in an incipient traveller. 'Une plume pour écrire l'Histoire de la France!'—'Un cahier pour la même!' And the intending historian of France, even with his imported pen and paper-book, and also three shirts and some pairs of socks, was allowed to go to his dinner, with his *magasin* in his hand, and start by the first conveyance; while his less fortunate fellow-travellers had to dine in absence of their luggage, and perhaps give the town that had the honour of being

their landing-place, the profit of their company for the night.

But what is the use of all these insinuations of aptitude for colonisation, when there is not such another man in the world? We beg pardon; but we have actually discovered such another, and to introduce him suitably has been the sole aim of our existence in writing this interesting preface. In a most authentic newspaper, we find the following admirable history, copied from the *New York Express* :—

'A man who had been an unsuccessful delver in the mines of Georgia, on hearing the thrilling news of the gold placers of California, had his spirit quickened within him; and although he had arrived at an age—being about sixty—when the fires of youth usually cease to burn with vigour, he fixed his eyes upon the far-distant and but little-known country, and resolved that he would wend his way thither alone, and even in the absence of that friend, generally thought indispensable, money, of which he was wholly destitute.

'Under such circumstances, it would not avail to think of a passage round "The Horn," or by the more uncertain, and at the same time imperfected route, across the Isthmus. But as California was on this continent, he knew that there was a way thither, though it might lead through trackless deserts and barren wastes. These were not enough to daunt his determined spirit. He bent his way to the "Father of Waters," and worked his way as he could, till he found himself at "Independence," in health, and with no less strength, and with 150 dollars in his purse. He had no family to provide for, or even companion to care for, on the route which he was about to enter. Yet some things were necessary for himself; and to relieve his body from the pressure of a load, he provided himself with a wheel-barrow, on which to place his traps.

'It must not be supposed that our hero was ignorant of the large number of emigrants that was moving over the plains, and it is quite probable that his sagacity was precocious enough to look ahead at the result of attempting to carry forward such ponderous loads, and such a variety of at least dispensable things as the earlier parties started with. A detailed list of the amount and variety of goods and wares, useful and superfluous, including many of the appendages of refined and fashionable life, would astonish the reader. Our hero was not in a hurry. He reasoned thus: "The world was not made in a day; the race is not always for the swift." He trundled along his barrow, enjoying the comforts of his pipe, the object of wonder to many, and the subject of much sportive remark to those who were hurried along by their fresh and spirited teams on their first days.

'Many weeks had not passed, however, before our traveller had tangible evidence that trouble had fallen to the lot of some who had preceded him. A stray ox was feeding on his track: the mate of which, he afterwards learned, was killed, and this one turned adrift as useless. He coaxed this waif to be the companion of his journey, taking care to stop where he could provide himself with the needful sustenance. He had not travelled far before he found a mate for his ox, and ere long a wagon, which had given way in some of its parts, and been abandoned by its rightful owner, and left in the road. Our travelling genius was aroused to turn these mishaps to his own advantage; so he went straightway to work to patch and bolster up the wagon, bound his faithful oxen to it, and changed his employment from trundling a wheel-barrow to driving a team. Onward moved the new establishment, the owner gathering as he went, from the superabundance of those who had gone before him, various articles of utility—such as flour, provisions of all kinds, books, implements, even rich carpets, &c. which had been cast off as burdensome by other travellers. He would occasionally find poor worn-out animals that had been

left behind, and as it was not important for him to speed his course, he gathered them together, stopping where there was abundance of grass, long enough for his cattle to gain a little strength and spirit. Time rolled on, and his wagon rolled with it, till he reached the end of his journey, when it was discovered that he had an uncommon fine team and a good wagon, &c. which produced him on the sale 2500 dollars.

'Being now relieved of the care of his team, and in the midst of the gold-diggings, he soon closed his prospecting by a location; and while all around him were concentrating their strength to consummate the work of years in a few months, he deliberately commenced building, finishing, and, as fast as he could, furnishing, a comfortable cabin. His wood he gathered and regularly piled in a straight line and perpendicular by the door, convenient as though the old lady had been within to provide his meals. He acted upon the adage, "Never to start till you are ready." Now our hero was ready to commence working his "claim;" and this he did, as he did everything else, steadily and systematically.

'He may yet be seen at his work, with the prospect—if he lives to be an old man—of being rich; for in the last two years he has accumulated 10,000 dollars.'

Need we add a word? This is decidedly the kind of man for emigrating—or, indeed, for remaining at home. We, being of his own character, can conceive his delicious nights of camping out, his head under his wheel-barrow, until he arrived at the dignity of a wagon; his principal luggage being perhaps a coverlet, to preserve him from the cold in sleep, and a gun that unscrewed, and its appendages, to provide him a fresh bird or beef. It is very probable that he sought neither of these, but was contented with something concentrated and preserved, and thus feasted; and with a drink from some delicious spring, or from a bottle—that could not be broken—supplied at the last spring he had passed, lay down conscious of his progress, well satisfied with the past, and hopeful of the future.

On his arrival at his destination, his conduct is equally exemplary. Every one should provide for the preservation of life and health as first measures; and if not done at a rate which future exertions are likely to render profitable, why make the expenditure? Now, many are in all these new adventures expending on inevitable necessities—having made no previous provision for them—such sums as render all their exertions hopeless; while at the same time they are sacrificing health and strength.

The government of Australia has certainly been very successful in preserving order at the gold placers there, and has given its sanction upon moderate terms; for here, we believe, gold and silver mines are *inter regalia*, and could have been entirely seized by the crown. We sincerely trust it will appropriate the great and unexpected revenue thence arising in improving the roads through this magnificent country, and providing shelter for the traveller; for at this moment, many of the roads being over the steepest mountains, and the gradients unmitigated by cuttings, or any other act of engineering whatever, they are all but impassable, and are travelled with the greatest torture to the unfortunate animals concerned. It was the reproach of Spain, that though in possession of South America for centuries, she had formed few roads; and that the few formed were bad, and the accommodation in their neighbourhood of the worst description—often open sheds, without food or furniture, or indeed inhabitants; or if inhabited, with only stones for seats, and raised mounds of earth for beds. Even now, in little more than half a century, things are better in Australia than this, at least wherever government has extended. But there is a vast deal more to be done; and it is a pity that in the first place suitable schools are not formed for the persons

intending to emigrate, and opportunity given them to do so, without the degradation of crime, and the expense and disgrace of conviction.

EMPLOYERS AND EMPLOYED.

THE *Westminster Review* for January, in an able and temperate article, entitled *Employers and Employed*, delineates the progress of the working power from the original condition of *serfdom*, through that of *vassalage*, which prevailed in the middle ages, to the system of simple contract in which we now find it in France and America. This the writer regards as part of a universal progress towards a more and more equalised condition of the various orders of men—'an equality, not perhaps of wealth, or of mind, or of inherent power, but of social condition, and of individual rights and freedom.' In England, however, we are only in a state of transition from that relation of protection on the one hand, and respect or loyalty on the other, which constituted the system of *vassalage*, to the true democratic relation which assumes a perfect equality and independence in the contracting parties. 'The master cannot divest himself of the idea, that in virtue of his rank he is entitled to deference and submission; and the workman conceives that, in virtue of his comparative poverty, he is entitled to assistance in difficulty, and to protection from the consequences of his own folly and improvidence. Each party expects from the other something more than is expressed or implied in the covenant between them. The workman, asserting his equality and independence, claims from his employer services which only inferiority can legitimately demand; the master, tacitly and in his heart denying this equality and independence, repudiates claims which only the validity of this plea of equality and independence can effectually nonsuit or liquidate.'

Arguing that 'the reciprocal duties of employers and employed, *as such*, are comprised within the limits of their covenant,' the writer goes on to say, that nevertheless there remains a relation of 'fellow-citizenship and of Christian *neighbourhood*,' by virtue of which the employer owes service to his work-people, seeing that 'every man owes service to every man whom he is in a position to serve.' Let not the Pharisaic fundholder and lazy mortgagee suppose that the great employers of labour are thus under a peculiar obligation from which they are exempt. The obligation is assumed to be equal upon all who have power and means; and it only lies with special weight at the door of the employer of multitudes, in as far as he is in a situation to exercise influence over their character and conduct, and usually has greater means of rendering aid suited to their particular necessities.

Before proceeding to expound the various duties thus imposed upon the employer, the writer lays down a primary duty as essential to the due performance of the rest—namely, he must see to making his business succeed; and for this end he must possess a sufficient capital at starting; and he must not, for any reasons of vanity or benevolence, or through laxness, pay higher wages than the state of the labour-market and the prospects of trade require. Of the secondary duties which next come in course—and which, be it remembered, arise not from the mastership, but from the neighbourhood—the first is that of 'making his factory, and the processes carried on there, as healthy as care and sanitary science can render them.' 'This is the more incumbent upon him, as it is little likely to be thought of or demanded by his workmen. It is a topic on which his cultivated intelligence is almost sure to place him far ahead of them; and out of the superiority, as we have seen, springs the obligation.' Our reviewer adds the remark, that, 'in the minor workshops, and especially in the work-rooms of tailors and seamstresses, the employers are still, for the most

part, unawakened to the importance and imperativeness of this class of obligations. The health of thousands is sacrificed from pure ignorance and want of thought.'

One mode of serving those who work for him, which the circumstances render appropriate, is to provide them with decent and comfortable dwellings. Much has been done in this way. 'In almost all country establishments, and in most of those in the smaller towns, the employers have been careful to surround their mills with substantial and well-built cottages, often with gardens attached to them, containing four rooms—kitchen, scullery, and two bedrooms: cottages which are let for rents which at once remunerate the owner and are easy for the occupier.' Even in large towns, where there are great local difficulties, something has been done by the building of Model Lodging-houses, and by the efforts of Societies for improving the Dwellings of the Poor. The writer specifies one of the greatest difficulties as existing in the working-people themselves: when provided with a variety of rooms for the separation of the various members of their families, they are very apt to defeat the whole plan by taking in lodgers, and contenting themselves with the filthy and depraving huddlement out of which their benevolent superiors endeavoured to rescue them. But it may be hoped that, by promoting only a few of the more intelligent and better-disposed to such improved dwellings, and thus setting up good examples, the multitude might in time be trained to an appreciation of the decency and comfort of ampler accommodation. Another wide field of usefulness is open to the employers in the establishment of schools, reading-rooms, baths, wash-houses, and the like.

It strikes us that the writer of this article is not true to his own principle in his view of the duties of the employer. We readily grant the duty of making his business prosperous and his workshops healthy. To fail in the latter particular especially, were not merely to fail in a duty, but to incur a heavy positive blame. But we cannot see how it is incumbent on the employer to provide houses for the persons who enter into the labour-contract with him, any more than to see that they get their four-pound loaf of a certain quality or price. It may be a graceful thing, a piece of noble benevolence, to enter into these building schemes, but it is also to go back into that system of *vassalage* out of which it is assumed that the relation of employer and employed is passing. Either the new buildings will pay as speculations, or they will not. If they are sure to pay, ordinary speculators will be as ready to furnish them as bakers are to sell bread. If the contrary be the case, why burden with the actual or probable loss the party in a simple contract which involves no such obligation? Clearly, there must be no great reason to expect a fair return for capital laid out in this way, or we should see building schemes for the working-classes taken up extensively by ordinary speculators. For employers, then, to enter into such plans, must in some degree be the result of benevolent feelings towards their men; and, so far, we must hold there is an acknowledgment on both sides that the system of *vassalage* is not yet extinct amongst us, and that the time for its extinction is not yet come.

If we look, however, at the entire condition of the working-people of England, we shall see that it acknowledges the same truth in some of its broadest features. When a time of depression comes, and factories do not require half of their usual number of hands, or even so many, it is never expected, on any hand, that the superfluous labourers are to maintain themselves till better times return. The employer is expected to keep them in his service, at least on short time, and at a reduced remuneration, although at a ruinous loss to himself. The workmen, though well aware of the contingency, make little or no provision against it, but calmly trust to the funds of their employers, or the

contributions of the class to which these belong. Now, while such a practice exists, the relation of employer and employed is not that of independent contractors, but so far that of the feudal baron and his vassals, or of a chieftain and his 'following.' It is, in effect, a voluntarily maintained slavery on the part of the operatives—a habit as incompatible with political liberty as with moral dignity and progress, and therefore a sore evil in our state. Obviously, to perfect the system of independent contract, the workmen would need to redeem themselves from that condition of utter *unprovidedness* in which the great bulk of them are for the present content to live. Instead of what we see so prevalent now—a sort of hopelessness as to the benefits of saving—a dread to let it be known or imagined of them that they possess any store, lest it lead to a reduction of their wages (a foolish fallacy), or deprive them of a claim on their employer's consideration in the event of a period of depression (a mean and unworthy fear), we must see a dignified sense of independence, resting on the possession of some kind of property, before we can expect that even this stage in the Progress of Labour shall be truly reached.

But is it not just one of the essential disadvantages attending the contract system, or may we rather call it the system of weekly hire, that while it prompts the employer to frugality, by the obvious benefits to him of constant accumulation, it leaves the employed, as a mass, without a sufficient motive to the same virtue, and thus insures their being retained in that unprovidedness which forbids independence and true social dignity? On this point, were we a workman, we should be sorry to rest in an affirmative, or to allow it to slacken our exertions or sap our self-denial; because if there is a higher development of the labouring state in store for society, it can only be attained by the more speedy perfection of the contract state in the *entire independence of the workman*. The writer from whom we have quoted thinks, and with his sentiments we entirely concur, that 'society, in its progress towards an ideal state, may have to undergo modifications, compared with which all previous ones will seem trifling and superficial. Of one thing only can we feel secure—namely, that the loyal and punctual discharge of all the obligations arising out of existing social relations will best hallow, beautify, and elevate those relations, if they are destined to be permanent; and will best prepare a peaceful and beneficent advent for their successors, if, like so much that in its day seemed eternal, they too are doomed to pass away.'

ANECDOTE OF THE FIELD OF SHERRIFMUIR.

My grandfather, William Wilson, was born in the farmhouse of Drumbrae, on the estate of Airthrey, at no great distance from the field of Sherrifmuir. At the rebellion of 1715, he was a lad of fifteen years of age, and learning that the rebels under the Earl of Mar had met with the royal forces under the Duke of Argyle in the neighbourhood, on the morning of Sunday the 12th November, while it was still dusk, he went to the top of a neighbouring hill named Gleanaty, from which the whole of the moor was discernible, and on which a number of country people were stationed, attracted to the spot, like himself, by curiosity. Being at no great distance from both armies, he could see them distinctly. The Highlanders, who observed no regular order, he compared to a large, dark, formless cloud, forming a striking contrast to the regular lines and disciplined appearance of the royal army. After observing them for some space of time, an orderly dragoon, sent by the Duke of Argyle, rode up to the spot where the spectators stood, warning them to remove from a position in which they were in as great danger as the combatants themselves. My grandfather accordingly returned home, returning with awe to the sharp report of musketry, intermingled with the booming of cannon, which now informed

him that the battle had commenced. He had not been long in the house when a dismounted dragoon made his appearance, requesting to have his left wrist bandaged, so as to stop the blood. The hand had been cut off, and his horse killed under him, and he was on his way to Stirling to seek surgical aid. While his wishes were being complied with, he occupied himself in taking some refreshment, till one of the farm-servants came in and warned him that four armed Highlanders were coming down the hill in the direction of the house. The soldier, who had no doubt been taught at the Marlborough school, and served perhaps at Ramillies and Blenheim, immediately went out to the front of the house, which concealed him from his enemies. Presently, he heard by the footsteps that one was near, when he instantly presented himself at the gable, and shot the foremost Highlander with his carbine; then, seeing that the others came on in Indian file, with short distances between, he advanced to meet them, dropped the second with a bullet from his pistol, and cut down the third with his sword. The fourth, seeing the fate of his comrades, took to flight. After this wholesale execution, the dragoon, with perfect coolness, returned to the house, finished his repast, tranquilly said his thanks and adieu, and went off in the direction of Stirling. The next morning the country people were summoned to bury the dead. The ground was thickly covered with cranreuch, and life still remained in numbers of both armies, who begged earnestly for water. But what struck my grandfather particularly was, that the heads and bodies of a great many of the slain royalists were horribly mutilated by the claymores of the Highlanders; while on those of the Highlanders themselves nothing was observed but the wound which had caused their death.—*Communicated by Mr Alexander Wilson, shoemaker, Stirling.*

THINNESS OF A SOAP-BUBBLE.

A soap-bubble as it floats in the light of the sun reflects to the eye an endless variety of the most gorgeous tints of colour. Newton shewed, that to each of these tints corresponds a certain thickness of the substance forming the bubble; in fact, he shewed, in general, that all transparent substances, when reduced to a certain degree of tenuity, would reflect these colours. Near the highest point of the bubble, just before it bursts, is always observed a spot which reflects no colour and appears black. Newton shewed that the thickness of the bubble at this black point was the 2,500,000th part of an inch! Now, as the bubble at this point possesses the properties of water as essentially as does the Atlantic Ocean, it follows that the ultimate molecules forming water must have less dimensions than this thickness.—*Lardner's Handbook.*

ENGLISH PLOUGHING.

The following, written from England, is going the round of the papers, and is as true as the gospel, in my opinion. I have seen better ploughing here with a pair of oxen than in the old country with five horses; but Johnny won't learn. 'Lord! only look at five great, elephant-looking beasts in one plough, with one great lummokin fellow to hold the handle, and another to carry the whip, and a boy to lead, whose boots have more iron on them than the horses' hoofs have, all crawling as if going to a funeral! What sort of a way is that to do work! It makes me mad to look at 'em. If there is any airtily clumsy fashion of doin' a thing, that's the way they are always sure to git here. They're a benighted, obstinate, bull-headed people the English, that's the fact, and always was.' Well done, Jonathan—quite true!—*From a private Letter from Boston.*

JOHN BUNYAN AND MINCE-PIES.

In No. 417 of this Journal it is chronicled that John Bunyan scrupled to eat mince-pies, because of the superstitious character popularly attached to them; but it would appear from an anecdote sent to us by a correspondent, that if this was true at all of the author of the *Pilgrim's Progress*, he must have received new light upon

the subject at a later period of life. When he was imprisoned for preaching—so says the anecdote—in Bedford jail, a superstitious lady, thinking to entrap him, sent a servant to request his acceptance of a Christmas pie; whereupon Bunyan replied: 'Tell your mistress that I accept her present thankfully, for I have learned to distinguish between a mince-pie and superstition.'

FOREST-TEACHINGS.

THERE was travelling in the wild-wood
Once, a child of song;
And he marked the forest-monarchs
As he went along.
Here, the oak, broad-eaved and spreading;
Here, the poplar tall;
Here, the holly, forky-leaved;
Here, the yew, for the bereaved;
Here, the chestnut, with its flowers, and its spine-
bestudded ball.

Here, the cedar, palmy-branchèd;
Here, the hazel low;
Here, the aspen, quivering ever;
Here, the powdered sloe.
Wondrous was their form and fashion,
Passing beautiful to see
How the branches interlaced,
How the leaves each other chased,
Fluttering lightly hither, thither on the wind-aroused
tree.

Then he spake to those wood-dwellers:
'Ye are like to men,
And I learn a lesson from ye
With my spirit's ken.
Like to us in low beginning,
Children of the patient earth;
Born, like us, to rise on high,
Ever nearer to the sky,
And, like us, by slow advances from the minute of
your birth.

'And, like mortals, ye have uses—
Uses each his own:
Each his gift, and each his beauty,
Not to other known.
Thou, O oak, the strong ship-builder,
For thy country's good,
Givest up thy noble life,
Like a patriot in the strife,
Givest up thy heart of timber, as he poureth out his
blood.

'Thou, O poplar, tall and taper,
Reachest up on high;
Like a preacher pointing upward—
Upward to the sky.
Thou, O holly, with thy berries,
Gleaming redly bright,
Comest, like a pleasant friend,
When the dying year hath end,
Comest to the Christmas party, round the ruddy
fire-light.

'Thou, O yew, with sombre branches,
And dark-veiled head—
Like a monk within the church-yard,
When the prayers are said,
Standing by the newly-buried
In the depth of thought—
Tellest, with a solemn grace,
Of the earthly dwelling-place,
Of the soul to live for ever—of the body come to
nought.

'Thou, O cedar, storm-enduring,
Bent with years, and old,
Standest with thy broad-eaved branches,
Shadowing o'er the mould;

Shadowing o'er the tender saplings,
Like a patriarch mild,
When he lifts his hoary head,
And his hands a blessing shed,
On the little ones around him—on the children of
his child.

'And the light, smooth-barked hazel,
And the dusky sloe,
Are the poor men of the forest—
Are the weak and low.
Yet unto the poor is given
Power the earth to bless;
And the sloe's small fruit of down,
And the hazel's clusters brown,
Are the tribute they can offer—are their mite of
usefulness.

'When the awful words were spoken,
"It is finishèd!"—
When the all-loving heart was broken,
Bowed the patient head;
When the earth grew dark as midnight
In her solemn awe—
Then the forest-branches all
Bent, with reverential fall—
Bent, as bent the Jewish foreheads at the giving of
the law.

'But one tree was in the forest
That refused to bow;
Then a sudden blast came o'er it,
And a whisper low
Made the leaves and branches quiver—
Shook the guilty tree;
And the voice was: "Tremble ever
To eternity:
Be a lesson from thee read—
He that boweth not his head,
And obeyeth not his Maker, let him fear eternally!"

'So thou standest ever shaking,
Ever quivering with fear,
For the voice is still upon thee,
And the whisper near.
Like the guilty, conscience-haunted;
And the name for thee
Is, "The tree of many thoughts"—
Is, "The tree of many doubts;"
And thy leaves are thoughts and doubtings—for thou
art the sinner's tree.

'Thou, O chestnut, richly branchèd,
Standest in thy might,
Rising like a leafy tower
In the summer light.
And thy branches are fruit-laden,
Waving bold and free;
And the beams upon thee shed
Are like blessings on thy head:
Thou art strong, and fair, and fruitful—for thou art
the good man's tree.

'So, farewell, great forest-teachers:
There is a spirit dwells
In the veinings of each leaflet,
In each flower's cells:
Ye have each a voice and lesson,
And ye seem to say:
"Open, man, thine eyes to see
In each flower, stone, and tree,
Something pure and something holy, as thou passest
on thy way."'

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 425. NEW SERIES.

SATURDAY, FEBRUARY 21, 1852.

PRICE 1½d.

VENICE.

At six, on a bright morning, the 1st of September 1851, we left the quay of Trieste in the steamer for Venice. We were in no particular mood upon the subject. If anything, we rather feared that the famous City of the Sea might turn out to have been overpraised. However, we resolved to be candid.

The morning passed pleasantly enough. We admired the snowy tops of the Styrian Alps on the right, and the deep green of the Adriatic was beautiful. We had calculated upon an eight hours' voyage; but it was scarcely eleven o'clock when the pinnacles and towers of the city began to appear above the water's edge to the west, taking us a little by surprise. It was thenceforward an interesting occupation for an hour or so to watch these objects gradually rising out of the waves. By and by, a large dome took its place amongst them; then some little domes and more pinnacles: at length a connected range of city objects lay along the horizon, and this we knew was VENICE. The steamer by and by began to wind through some straits or channels of the sea, with fortifications covering the low banks on both sides. It went on; and about one o'clock, under a bright sun, we found ourselves in an open space of sea, opposite the famous series of buildings composed of the Doge's Palace, the Cathedral of San Marco, the Piazza, &c.—objects perhaps of their kind the most generally known in Europe.

The first few minutes was a confused mixture of romantic association and solicitude about a right hotel. Our thoughts slid with prosaic facility from the lion on the top of the obelisk, so well remembered from Canaletti's pictures, to the sign of the Leone Bianca—a place of entertainment not far off, much recommended by Murray. I recalled the Byronian heroines sailing about in those gondolas, which we saw skimming away here and there, and wondered whether it would be best to go to Dameli's or the Emperor of Austria. The first business was to get a gondola for ourselves and luggage; thus, at the very first reducing to the character of a mere cab that picturesque species of conveyance—I, the conductor of the party, wondering all the time how much those two cowed villains would charge me. Seated there with my two ladies, we speedily proceeded along the Grand Canal towards the hotel last mentioned, to try if we could obtain accommodation in it. It was curious to land from a boat at the steps of a house, and walk from the sea into the hall. It was dazzling to see the splendour of the building, with its fine marble vestibule within, and its superb staircases. We did not find in it, however, exactly the range of rooms we required, and we after all returned along the canal, and

tried the Hôtel de l'Europe, a similar, but somewhat plainer house, where we got apartments to our mind.

I was curious at first to study the arrangements of houses and streets in Venice. Here I found that what had once been the palace of a noble, presented, first, a ground-floor about three feet above the medium level of the Adriatic, composed of a broad vestibule crossing through from front to rear, with the inferior apartments on each side; second, a floor of good apartments, with an open hall in the centre right over the vestibule—this hall adorned with pictures; third, a similar good floor, with another hall in the centre, which had been the banquetting or dining-room, and was now used as the *salle-a-manger* of the hotel—and this salle had balconied windows at one end looking out upon the canal. There was, I suppose, a fourth floor of inferior rooms, but there I never had occasion to be. Most of the rooms, looking out at the sides of the building into narrow lanes, were ill-lighted: only those having windows to the front were light or cheerful. The walls, staircases, and floors, were all of marble—the proportions large, and the decorations elegant. The date, 'JAN. 1676,' appeared over an inner door in the salle.

A side-door in the rear of the house gave me exit for a walk into the town. I found myself in a paved lane, here called a *calle*, with good houses on each side. It led me into a wider lane, which had all the characters of a street, excepting that it was comparatively narrow, and only traversed by people on foot. Here I found shops of many kinds, but almost all on a small scale; as also many stalls for the sale of fruit and other petty articles. Following this way to the right, I soon came to the outside of the great square, which is the principal public place in the city. It was but necessary to go through a wide passage, to find myself in the Piazza—that well-known paved and arcaded quadrangle, which we have seen so often in pictures; the far extremity being closed by the singular church of St Mark, while close by rose the lofty campanile and the three tall flag-staffs. We sauntered for an hour about this grand central region, viewing the outsides of things only, and dreaming of those scenes of the past with which they were connected. After dinner, I again went out by myself to walk through the town, for it was agreed that we should put off regular sight-seeing till next day. Let not the reader be surprised to hear of walking through Venice. It is permeated in all directions by calles and narrow streets, which cross the canals by high-arched stone bridges, thus giving pedestrian access to and from all parts of the city. Certainly, however, no such thing as a leading thoroughfare exists, and it must be difficult for strangers to

acquire that local knowledge which will enable them to find their way without a guide. Unlike all other cities, no kind of vehicle, not so much as a wheelbarrow, ever rattles along these narrow, tortuous ways. The gondolas upon the canals are strictly the only conveyances used in Venice. Thus the city has a stillness which, even in its most brilliant days, must have impressed strangers with a sense of melancholy. In our time, when Venice is reduced at once from independence and from wealth, the effect is peculiarly depressing. I felt as if Venice were only a *curiosity* to look at for a few days, not a place in which any considerable portion of life could be spent with comfort.

Next morning, at eight o'clock, by which time we had breakfasted, a gondola with two rowers waited for us at the porch of the hotel, along with a clever, well-informed youth named Alessandro, who had undertaken to be our *cicerone*. The charges for both gondolas and guides had, we found, been raised since the late troubles, in common with everything else in Venice, liberty being always somehow a provocative to taxation, whether temporarily or permanently enjoyed. What in 1843 would have cost six English shillings, now stood us eight or nine. The gondola, as is well known, is a long boat, pointed at both ends, and painted black—furnished in the centre with cushioned seats, all black, over which is erected a kind of cot, with windows, to screen the passengers. One man stands in the fore, another in the back part, rowing with their faces forward, the oar working in a twisting manner on the top of a piece of wood curiously grooved for the purpose. I cannot say that I saw anything very peculiar in the dress of the gondoliers, or indeed in the appearance of any of the people of Venice, excepting the female water-carriers. With that exception, the people are dressed in much the same manner as is customary over Europe generally. So far as I recollect, not a single veiled or half-veiled lady, sailing in her own gondola, met our eyes while we were in Venice. We have to revert for all such things to Goldoni's plays and the pages of our own Byron.

The real grand thoroughfare of Venice is the *Canale Grande*—a wide curving street, which sweeps through a great part of the city. The principal palaces of the nobility, the superbest of the churches, and the best hotels, are placed along this water-street. As we moved along, Alessandro told us, in respectable French, the history of each great mansion, and what its owners had done in the history of the republic: a recital as intelligent and as accurate as could have been expected in a book. Most of these buildings have a melancholy, decayed look, being generally very old, and few of the owners being able to spend much in or on them. A few that look tolerably fresh, are found to be occupied by the post, the customs, or some other office, the insignia of which figure in gaudy colouring over the principal entrance. In connection with most of the palaces, the name of some architect of reputation is mentioned. They are wholly of marble; and, in many cases, round stones of a precious kind, or pieces of marble of a brilliantly veined character, are set in a species of framework in front, communicating a peculiarly rich effect. The least pleasing circumstance connected with these superb mansions, is their being so closely beset by other buildings. We saw only one or two which had any spare space associated with them, to form either a

court-yard or a piece of garden-ground. Space is indeed the great want of Venice. Many of the canals, dividing lines of houses as lofty as those of the Old Town of Edinburgh, are not wider than the *wynds* of that celebrated city. And yet there we see the landing-places and entrances of magnificent mansions, though more frequently the houses on such narrow canals have the air of merchants' stores and warehouses.

It would be vain to attempt a detailed description of one-half of the wonderfully beautiful old churches, palazzos, and other buildings, which we examined during this and the subsequent day. We were agreeably disappointed on the whole; for we had come with an idea that we should see only the shell of ancient Venice, and few of those works of art which used to be associated with its name; whereas the fact is, that all the most remarkable old buildings are entire, and in tolerable order; and scarcely a picture, or statue, or antique curiosity, has been lost during the political changes which the city has undergone. Doubtless, it is living Venice no more: it is Venice reduced to a museum—but what a museum! And here I must do the Austrian government the justice to say, that it appears to have a deep feeling of interest in the ancient monuments of the republic. It contributes handsomely for their maintenance; and no modern proprietor of an old palazzo can make any change in it, till he has satisfied a tribunal of taste, that the change will be in keeping with the antique and picturesque glories of the place.

We went at an early hour one day to see the Pisani palace: one of those which are attractive on account of their containing good works of art. The Pisani are an illustrious family: and the representative still lives in this fine old mansion, or at least occasionally occupies it; but he is a broken-down old man, who has survived wife, children, and other relatives, and his death must speedily close the many-centuried history of his name. It was with melancholy feelings that we stepped into the hall or vestibule, whose broken plasters are still graced with coats-armorial and emblems of ancient dignity; amongst the rest, two standards wrapped up round their staves, probably memorials of the great Pisano—a naval commander of the fourteenth century. The housekeeper's little children were playing about the place, as children in an ordinary city would play in a street among the dogs and carriages. Mounting a wide side-staircase, we reached a handsome first floor, composed of a central *salle* and side-rooms, tolerably furnished; and here we found the two pictures for which the Pisani are famous—The Death of Darius, and his Queen supplicating Alexander, by Paul Veronese. They are beautiful paintings; and by their value, still give a sort of dignity to this decayed family.

Another palace we visited was that of the *Vendramini Colerghi*, now the property of the Duchesse de Berri, who makes it her ordinary winter-quarters. It is a large and elegant building, in a form approaching that of the letter Z, with a flower-garden in front of the receding part. The duchesse is understood to have purchased it for 120,000 *zwanzigers*—equivalent to about £4000, and not the value of the stones of which it is built. With great good taste, she has made no alteration in the decoration or destination of the rooms, but has added modern furniture, family portraits, and many objects of *virtu*. The series of apartments on the first floor above the vestibule is extensive and superb; and though the *tout ensemble* is more characteristic of a modern

French princess than of an ancient Venetian family, it was pleasant to see at least one of the palazzos of the ancient republic handsomely furnished, and having the appearance of cheerful occupation. Among the portraits are some that could scarcely have been expected to survive the Revolution of 1792—as Louis XIV.; Louis XV. when a boy; some of the princesses, aunts of Louis XVI.; also the dauphin, father of the latter monarch. There is likewise a beautiful cabinet of Marie Antoinette. Such articles, we presume, must have been obtained from the palaces at the downfall of royalty, and preserved by various accidents till the restoration, when the royal family would of course be eager to recover them at whatever expense. We saw here a portrait of the Duchesse, with her infant son, standing in widow's weeds, beside the bust of her assassinated husband; also portraits of the Duc de Bourdeaux, his wife, the Duchesse's present husband, and her younger set of children. In a glass-case were the gilt spurs of Henri IV. The Duchesse gives gay parties in winter, when the full suite of rooms must have a fine effect.

The churches of Venice are numerous—about a hundred in all, being one for every thousand souls, while I am told there is a priest for every hundred. We visited eight or ten of the most remarkable; and so bewildering was their magnificence, and so confounding the multitude of fine things shewn in them, that if I had not taken note of everything at the moment, I must have had only one confused idea of something supra-mundane fine. A great church in Venice is usually a structure of pure marble, with a dome or tower. The interior is one open space, with the usual double colonnade, a raised off altar-space at the upper end, and little chapels in the aisles on both sides. Generally, over the principal altar is some large scriptural picture—a Crucifixion, or a Taking Down from the Cross, or an Ascension; the production of Titian, or Tintoretto, or Paul Veronese, or some other artist of the Venetian school. Over the lateral altars are similar works of art. Sometimes one of these side-chapels is at the same time the tomb of a noble family, which assumes the duty of keeping it in order. In many of the churches, nothing can exceed the beauty of the sculpture which is lavished over the interior; and, while many features are common, each usually contrives to have some special beauty or some exclusive possession on which a peculiar fame rests. For example, the church of *San Giorgio Maggiore* has some wooden carved-work by a Belgian artist, of surprising beauty. *Gli Scalzi* is a paragon of elaborate decoration. The church of the *Frari*, old and Gothic, is full of grand tombs, including those of several doges, that of Titian, and a monument to Canova. The *Santa Maria della Salute* has a fine collection of pictures over and above those in the church. This church was built in 1632, by a decree of the Senate, as an act of thanksgiving to the Virgin for putting an end to a pestilence by which 60,000 people had been carried off. It is a most beautiful structure, full of fine things; and altogether a curious monument of that delusion of ignorance and misdirected piety which made men assign to a chapter of priests the duty now committed to a Board of Health, and persuaded them that a church was of much greater efficacy for the cure of the pestilence than an hospital.

I have as yet said scarcely anything of the ducal palace and church of San Marco, which are the principal and central objects of Venice. The first is a quadrangular building, with a court in the centre; very peculiar antique architecture, with a double row of stables both outside and in; the whole having a strikingly Oriental character. In front, and at one side, is a pavement, forming the principal open space in Venice; the haunt, of course, of many loungers of all characters; and distinguished by the two well-known pillars, one of which bears the lion of St Mark. The interior

of the palace presents a succession of grand old halls, the scene of the court-glories of the ancient doges. One, called the *Sala del Maggior Consiglio*, is 154 feet long by 74 broad. It has a *dais* at one end, on which the throne must have been placed; and over this a picture of Paradise by Tintoretto, covering the entire end of the room—of course 74 feet long—being thus the largest picture ever painted on canvas. Around, under the ceiling, are the portraits of the series of doges. The *Sala del Senato* still exhibits the seats of the senators, each furnished with its candlestick for protracted discussions—a melancholy memorial of departed independence. We gazed, too, on the Hall of the Council of Ten, and the lesser room where the more terrible Council of Three held its sittings; all now reduced to mere show-places, but still strongly suggesting their original destination. The Lion's Mouth, in the outer gallery, to which any accusation could be committed, was not forgotten. After dwelling a due time upon the rooms, and the numerous pictures and other works of art presented in them, we descended into the dungeons or *pozzi*—narrow stone-chambers destitute of light, where Venetian justice formerly kept its victims—a terrific specimen of the reckless inhumanity of past times. Finally, we passed to the Bridge of Sighs, which is detected to be an after-thought structure, designed to connect the palace with the more modern prison in the rear, a canal intervening. I suspect, after all, that many of the stories told about the *pozzi* and the bridge are mere myths, the reflection of ideas which the appearance of the places suggests.

The church of San Marco, adjoining the palace, and forming one side of the Piazza or square, is like no other building I ever saw—decidedly Oriental in style—indeed such a building as Aladin might have evoked by his lamp; which reminds me, by the way, that there is a prevalent tinge of the East all over Venice, seen in the architecture particularly. The vaulting and arching of this church are all described as Byzantine in style, and are therefore round; but it has been a custom in Venice to fix up on such a building as this any reliques of antique sculpture which have been taken in the countries with which the Republic was at war: accordingly, the front of San Marco bristles all over with curious pillars and carvings, including, above all, the four celebrated bronze horses which Napoleon took to Paris, and which were restored after his downfall. Walking through one of the low-browed doors, we pass across a vestibule, where a stone is pointed out in the pavement as the spot on which the emperor Barbarossa laid his head beneath the foot of Pope Alexander III. Then proceeding into the interior, you find the dusky atmosphere dimly blazing with a peculiar glitter from the walls and ceilings, the whole being one mass of gold mosaic, on which scripture subjects are inserted in a darker colouring. Think of a huge church, the interior facing of which is composed of pieces of gilt stone, each no bigger than the point of your finger would cover! But this is not all. The wide-extending pavement is seen to be composed in like manner of small pieces of marble and precious stones, set so as to form regular figures, all most exact, and still wonderfully entire, though it has endured the feet of daily thousands for several centuries. Unfortunately, from some infirmity in the vaulting below, this singular floor is thrown into undulations, in some places so great as to require care in walking over them. I spent hours in wandering about and examining the many curious things which are to be seen in this church, including those of its famous treasury. It is truly surprising that, after so many revolutions, so many of these valuables have been preserved. The fidelity of the priesthood to their charge is surely deserving of some admiration, considering how many opportunities there must have been of making away

with precious articles, after which no inquiry would probably have ever been made.

A campanile, or bell-tower, has been erected in the square near the church, and is one of the most conspicuous objects in Venice; rising, as it does, above every other building. It seems slender; but I was surprised to find, on a rough measurement, that the sides are not less than fifty feet wide. A paved way, instead of a staircase, conducts to an open *loggia* near the top, whence you can have a complete view of the city. I remarked that the tops of many of the houses are of use in the same way as gardens and summer-houses are in other countries. People go there to smoke, or to take their coffee—the chimneys being a very slight obstruction to such enjoyments in a country where little fire is used. We here also had a good view of the celebrated *orologio* of Venice; a tower containing an ancient clock of peculiar elaborateness of construction. On the top stand two metal giants, armed with ponderous hammers, with which to strike the hours and quarters on a huge bell, placed between them. There is something terrible in these automata; and the feeling is not allayed when you hear that one of them once committed a *murder*, having with his hammer knocked an incautious workman over the battlements! The campanile was begun in 902; and I felt interested in tracing its resemblance, both in architecture and relative situation, to the square tower of St Andrews, which is supposed to be of nearly the same age.

My limits leave me no room to dilate upon our visit to the Accademia. Indeed, in the visit itself, we could do little more than pause here, and there as a Titian or Tintoretto cast up in the multitude of pictures, or when we came before some specimen of the very early masters, of whose works there are many dating so far back as the end of the fourteenth century. There were some pictures representing transactions in Venice, of not much later date, which I regarded with interest, as preserving to us the appearance of men and things in that age; particularly one depicting some miracle, in which several grave ecclesiastics are seen swimming about in the Grand Canal, while ladies look on from windows and balconies, which I convinced myself still exist there. I must be equally brief with that place which no countryman of Shakspeare can avoid visiting, though the present Rialto is, after all, later than his time. It is of a curious structure as a bridge; there being three rows of building along it, containing shops, with two roadways for passengers. One crosses backwards and forwards, muttering: 'On the Rialto thou hast rated me,' &c.; goes distractedly into a shop, to purchase a breastpin, as a memorial of the place; and then plunges down the stairs, to resume his place in the gondola. We took a couple of hours to pay a visit to the Armenian monastery, on the island of San Lazzaro—the place to which Byron resorted in order to study the Armenian language. It is a curious old establishment, with some modern activity about it in the diffusion of literature; the monks having a printing-office in tolerable briskness, whence they issue books in various languages. We were delighted with the flush of beautiful flowering, from the oleander bushes in the central court, and the vine-hung alleys in the garden behind. I must not forget, in this hurried close of my adventure, the two moonlight sails we had through those mysterious watery streets, where, the associations of day and of the active world being shut out, we felt as if each light in the old palazzi illumined some scene of mediæval romance. That was like no other thing in our lives. On the third evening, we left this dream-city by a means which we had studiously ignored all the time of our visit—namely, a *railway*, which crosses from Venice to the mainland. It was something of a waker to find ourselves at 'the station,' on the bank of one of the canals, and see a range of 'omnibus

gondolas,' all duly labelled for their respective courses through the city, and ranked up in front like so many of the terrestrial machines which haunt the ordinary railway termini of this earth. However, we had the consolation of reserving this to the close of our visit, when, of course, we must have awaked out of our Venetian feelings at anyrate. The train brought us to Padua long before bedtime.

REALLY! INDEED! IMPOSSIBLE!

DURING a prolonged summer sojourn with kind friends resident in a quiet country town, we became quite interested in the tactics of the neighbours, and acquainted with their social condition.

'I think we have almost exhausted our visiting round,' said our hostess, Mrs Smith, one morning, as she replenished her card-case, 'with the exception of *Really*, *Indeed*, and *Impossible*, to whom we must introduce you. You look puzzled! but I mean the three Misses Bonderlay, who are usually distinguished by these interjectional names. We will forthwith send them an invitation to tea this very evening, and they shall be their own etymologists.'

At the appointed hour, three ladies were ushered into the drawing-room, bearing so startling a resemblance to each other in person, manner, and costume, that we at once decided they must be *trins*. Not so, however; there was a year or two's difference in age between them, which rendered the strong resemblance more remarkable. They were tall, well-formed, plump ladies, of middle or uncertain age; with round, unmeaning faces, flaxen locks, and pale-blue eyes. There was not a perceptible thread or pucker different in their three dresses, which must have fitted all indiscriminately; the flaxen curls were arranged in precisely the same waves round each mealy countenance; and the neat caps, with bright-green ribbons, doubtless had the same exact quantity of tulle and gauze in their fashioning. Each sister owned a delicate work-basket—trinal baskets also; and in each receptacle reposed a similar square of worsted-work, the same to the last stitch. We heard the visitors named as Miss Bonderlay, Miss Paulina Bonderlay, and Miss Constantia Bonderlay; but that was of no use, since they were not ticketed, and our blunders became embarrassing and ludicrous. We addressed Miss Bonderlay as Miss Paulina, when the senior lady drew up with dignified composure, and pointing to a sister, said: 'I am Miss Bonderlay: that lady is Miss Paulina Bonderlay.' And so on with the other two, who explained that they were juniors, as they waved a lily hand towards their eldest sister, indicative of her supremacy. But as the evening advanced, we learned to distinguish them by a peculiarity of expression, which had gained for these amiable maidens the somewhat singular cognomens of *Really*! *Indeed*! and *Impossible*! for their conversation, if conversation it could be called, consisted almost wholly of these interjections, pronounced in an unvarying, monotonous voice, while no shadow of emotion was perceptible on the cloudless expanse of their unwrinkled physiognomies.

When they were addressed in the usual conversational appeal which demands a reply of some kind, Miss Bonderlay, sipping her tea, or bending over her work, softly ejaculated: 'Really!' If you turned to Miss Paulina for some more tangible announcement of her opinion, she responded, in precisely the same tone: 'Indeed!' And when, as a last resource, you

looked towards Miss Constantia, the word 'Impossible!' and that word alone, fell in honeyed accents from her ruby lips. By this means they were easily distinguished; and their most intimate friends often failed to recognise which was which when apart, and sometimes even when they were together, until the talismanic syllables gave to each her individuality. The peculiarity gave rise to a little good-humoured ridicule; but for our part, we thought it quite wonderful how well they played their part in conversation with so small a stock of words. There is much pliability of meaning, however, in an interjection; and in company, where there are always several persons who are anxious to be heard, it is a positive virtue. In Miss Constantia's intonation of her favourite 'impossible!' it seemed to me that there mingled a dash of sadness, a kind of musical and melancholy cadence, which was followed by an unconscious absence of mind, evidencing the fact, that her thoughts were what is vulgarly termed 'wool-gathering.' On mentioning this impression to Mrs Smith, she complimented us on our keen observation, since, in truth, a tinge of the romantic *did* attach to the history of the fair Constantia; and she then sketched the following outline, leaving all details to be filled up by the imagination of the auditor:—

The Misses Bonderlay, it seems, had attained the age of womanhood, when, by the decease of their surviving parent, a man of high moral rectitude, but a stern disciplinarian, they were left in possession of a comfortable independence, fully equal to their moderate wants. They had been governed with such an iron rule, and treated as such absolute automata from their childhood, that when the hand of death released them from the despotic sway, its effects still continued apparent in the constraint which habit had rendered second nature. They continued to reside in their native town, only removing to a smaller house, and pursued undeviatingly the routine they had always been accustomed to—a routine which might well bear comparison, in its monotony and apathy, with that of monastic seclusion. Rumour, with her thousand tongues, had never singled out these vestal ladies as objects of matrimonial schemes; no suitors darkened their doors or disturbed their peace; they made no enemies, and, perhaps, no very enthusiastic friends. They listened to the gossip retailed by their neighbours, as in politeness bound, but the imperturbable 'Really!' 'Indeed!' and 'Impossible!' gave no encouragement to gossip: they never asked questions, never propagated reports, but listened and ejaculated, and ejaculated and listened, giving and receiving no offence. It never was positively ascertained whether the Misses Bonderlay conversed among themselves; but popular opinion maintained, that they did not, assigning the ill-natured reason, that they had nothing to say. Being neither oral inquirers nor readers, what could they have to talk about? Still, popular opinion is often wrong, and perhaps it was so in this instance. At anyrate, if they did not exchange confidential sentiments, quarrels were avoided; and smoothly the three fair sisters sailed down the troublous stream of time.

It was a great and stirring event in their tranquil lives, when a maternal uncle, as if to vindicate the fidelity of old romance, did actually return from India to his native land with a large fortune. Mr Elliston, a childless widower, took up his abode at a watering-place, and sent for his eldest niece, Miss Bonderlay. She promptly obeyed the summons, and of course it was generally reported, and with some colouring, that the bulk of the nabob's fortune would be hers if she 'played her cards well.' But she did not play her cards well, as the event turned out; for the old splenetic Indian tired very soon of the monotonous 'Really!'—the sole response to his wonderful narratives of tiger-hunting and Eastern marvels in general. At length, Mr Elliston bluntly gave his visitor

to understand that he wished to see Miss Paulina; and poor, crestfallen Miss Bonderlay returned home, and Miss Paulina departed in her turn to fill the vacant place at the nabob's board. She remained a considerable time longer than her elder sister had done; and it was surmised that 'Indeed!' had proved more agreeable than 'Really!' But, alas! for human foresight and conjecture, the second Miss Bonderlay re-appeared in her native town for the purpose of despatching the third relief in the person of Miss Constantia. 'The young one will have a human tongue,' muttered the choleric Indian: 'I want a companion, not a parrot.' The poor gentleman never imagined that there could be three parrots in one family; and he naturally, concluded, that his choice had fallen on the right niece at last.

When he found out his mistake—and we need hardly say that he was not long about that—his chagrin and consternation may be imagined. Indeed, had it not been for the presence of a certain Major George, there is no doubt that when he heard the sweet 'Impossible!' of Miss Constantia, he would instantly have consigned her to the banishment and oblivion of her sisters. But Major George's quiet influence restrained the threatened ebullition of wrath; though when his best stories and jokes after dinner were received with a gentle 'impossible!' which meant either 'really,' or 'indeed,' or anything else it might pass for, Uncle Elliston struck the table violently with his clenched hand, exclaiming in a passion: 'Impossible? madam—impossible? Do you mean to give me the lie? I tell you, the anecdote I have just related is perfectly possible, and, moreover, perfectly true. What do you mean by impossible? I hate impossibles. Nothing is impossible! Do you mean to insult me, madam—height?' 'Impossible, dear uncle—impossible!' meekly ejaculated the gentle fair, affrighted at such an unusual display of excitement; and it was fortunate that Major George called off her uncle's attention from poor Miss Constantia's unconscious delinquency.

Major George was an Indian crony of Uncle Elliston's; considerably younger, however, than the latter, and, as the spinsters remarked sententiously, only sallow enough to be interesting, and only old enough to be sedate! His purse was amply filled, and Major George was on the look-out for a wife; but being most painfully shy and sensitive, it seemed rather a doubtful case if he would succeed in his aspirations. With the nabob, Major George was an immense favourite; but except that they had hunted tigers together, there seemed no adequate reason for so strong a preference—the taciturnity of the one being as remarkable as the communicativeness of the other. Mr Elliston called George a 'good fellow,' and slapped his shoulder approvingly; and introduced him to Miss Constantia with sly and peculiar *empressment*. Major George's visit was prolonged, and Miss Constantia's visit was prolonged far beyond the period allotted to her sisters; and Uncle Elliston gradually ceased to rave at 'Impossible!' But a terrible climax approached, and how it came about no one ever knew: Major George set off for Paris early one fine morning, and Miss Constantia appeared at the breakfast-table with eyes red and swollen with weeping. The nabob insisted on knowing what was the matter, and why his favourite had taken flight so unceremoniously.

'You don't mean to say you've refused him, Niece Con?' cried her uncle, 'for I know he meant to make you an offer of his hand and heart.'

'O no, uncle, no!—impossible!' sobbed the weeping lady.

'Oh! deuce take your impossibles, Con Bonderlay. Tell me if the lad asked you to marry him, and what your answer was?'

She hesitated—looked up—looked down—looked startled; and then murmured, as if examining for

the first time the word, as it slipped musically from between her lips, 'Impossible!'

'Well, Niece Con, I think you've said *impossible* once too often in your life, if this is to be the upshot. Come now, be candid and don't be a fool! Did you intend to refuse Major George?'

'Impossible!' was the reply; which, habitual as it was, burst forth this time in a passion of tears and blushes.

Mr Elliston always affirmed that he saw at a glance how the matter stood: that, in short, Major George had made a 'fool of himself.' The lady had not intended to reject him; but the major, from his shy, shamefaced nature, on hearing Miss Constantia's fatal 'impossible!' in reply to his love-suit, had flown from the scene of disappointment without an attempt at explanation. Acting on such a supposition (for mere supposition it remained, neither the lady nor gentleman making the slightest confession), Mr Elliston addressed his niece with more gentleness, a dash of pity mingling in his tone: 'Niece Constantia, I shall write to Major George, and bring him back again; but mind you don't say "impossible" a second time!'

However, Mr Elliston indulged in the fault of procrastination, which in him often led to results he did not anticipate: he rarely remembered that excellent maxim, which advises us never to postpone till to-morrow what can be performed as well to-day. To-morrow came, indeed; but with it also came an attack of gout, which incapacitated him from exertion for weeks: and scarcely was he convalescent, when a letter was put into his hands from the absentee, announcing the marriage of Major George with a very pretty and charming young lady. Mr Elliston handed the missive to his niece: she perused it in silence; but her uncle told Mrs Smith, in strict confidence, that he felt almost sure a tear fell on the paper. Be that as it might, shortly afterwards, when Mr Elliston signified his intention of inviting Major George, Major George's young bride, and the young bride's elder sister, to pay him a visit, Miss Constantia expressed a desire to return home. Her uncle acquiesced with rather too much alacrity for conventional *politesse*, exclaiming as he did so: 'I only hope, Niece Con, that George's wife won't be a "Dear me!" or a "Well, I never!" but a hearty, comfortable, chattering woman, with a will and a way of her own!'

Nor were Mr Elliston's hopes in this instance doomed to disappointment; for Mrs Major George had not only an actual tongue, but a way and a will of her own so decided, that ere the expiration of their visit, she succeeded in bringing about a union between the nabob and her elder sister. Some folks affirmed, that Mr Elliston came speedily to endure the flat contradictions of his wife with the humility of a broken spirit, and to speak with tender regret of his meek and inoffensive nieces. They, quiet souls, heard of their uncle the nabob's marriage without surprise, and without expressing emotion of any kind, beyond the 'Really!' 'Indeed!' and 'Impossible!' appertaining to each, as her distinguishing characteristic or mark of identity. When we first met the Misses Bonderlay, with their trinal baskets and squares of worsted-work, they were preparing a beautiful hearth-rug as a present for their uncle's wife, to be formed of these identical squares, with numerous others of a similar construction, and surrounded by a corresponding handsome border. Since that period, we have been favoured with exquisite specimens of their united industry; for the greatest pleasure of their lives consists in bestowing such-like gifts of handiwork on their friends and acquaintance.

But we have derived another benefit from our intercourse with the sisters. Whenever we find ourselves at a loss for an inoffensive reply, or are unwilling to pursue a discussion, we find a safe refuge in copying

their harmless peculiarity; for, after all, the meaning of words depends very much on intonation: and we have not unfrequently had confirmed, by our own experience, the theory we have ventured to promulgate—that there is much virtue in such interjections as Really! Indeed! and Impossible!

THE GREAT AFGHAN BLUNDER.

EVERY war is a blunder; every battle a blot of shame upon human nature; and the greatest wisdom a successful belligerent can shew, even when he has been forced into the fray by his beaten antagonist, is to get out of it as fast as he can. But some wars are viewed, not as they ought to be, as indications of the slow progress of the human race from barbarism, but through the medium of the lofty and chivalrous feelings of the resisting party, or the party which takes arms against oppression. Hence, war and glory have come to be associated in the vulgar mind; and hence the mere act of fighting is termed honourable, although it is obvious that, abstractedly, it should excite only feelings of shame. Even the late Afghan war is looked upon as a calamity, relieved throughout by flashes of heroism and gleams of success—a war which, rightly viewed, is either one of the greatest crimes, or one of the most stupendous blunders recorded in history!

This war, we observe, has already found a chronicler, and one peculiarly qualified, both by his knowledge and talent, to do justice to the subject.* Although possessing all the essentials of history, however, the book has something more, and is therefore not strictly a history, in the conventional sense of the term; the text as well as the margin being burdened with letters, diaries, and documents of all kinds—the crude materials which it is the province of the historian to digest. The author, notwithstanding, has a clear historical head; his narrative, when he permits it to flow uninterrupted, is animated; his reflections generally philosophical; his summaries of individual character acute and distinct; and so peculiar have been his sources of information, that henceforward no man will sit down to write upon this era of the history of India, or of Central Asia, before carefully consulting the volumes of Mr Kaye.

These volumes, however, comprise between thirteen and fourteen hundred octavo pages, filled with hard names and minute details, and rendered more difficult by the unpardonable want of an index. Although a necessity, therefore, for the more respectable libraries, and a thing to be hoarded by all collectors as a work of reference, the book has little chance of being known to the mass of the public; and we propose, therefore, to arrange the few extracts we are able to give, in such a way as, with the aid of our own filling up, may convey to the general reader—what, we suspect, he has never received before—some distinct idea of one of the most fantastic tricks that ever made the angels weep.

There is no country in the world more secure from external invasion than India; but on the west, more especially, nature has interposed between her and the more civilised powers of Europe and Asia a succession of rivers, mountains, and deserts, absolutely impassable by an army of any formidable magnitude. Notwithstanding this, there had been long an uneasy feeling connected with the idea of the territorial aggrandisement of Russia, and of late years, by the desire manifested by that power to interfere in the affairs of Persia. In 1837-38, therefore, when a Persian army was before Herat, with Russian officers busy in the camp, it is no wonder that, to previously excited imaginations, the danger should have

* *History of the War in Afghanistan*: from the unpublished Letters and Journals of Political and Military Officers employed in Afghanistan throughout the entire period of British Connection with that Country. By John William Kaye. 2 vols. London: Bentley. 1851.

seemed to assume a tangible form. The principality of Herat, although on the other side of intervening deserts, extending for many hundred miles, was in itself a fertile and beautiful oasis, where a numerous army might be refreshed and provisioned, and established as on a vantage-ground. From thence the Persians, strengthened and officered by the Russians, might roll on towards Cabool, and there prepare for a descent upon India. This magnificent but terrible idea was not examined in its details—it was taken for granted as a thing not only possible but probable; and the far-distant region of Hindostan, separated as it was by deserts, mountains, and rivers from the tumult that agitated Central Asia, was stirred by conflicting feelings of terror and exultation. British India, from the Himalaya to the sea, is dotted here and there with native states, which the inconsistent policy of the Company in Leadenhall Street has preserved in a kind of liberty, as relics and remembrancers of a past régime. But besides these uncertain protégés, we had to look to the natives in our own provinces, who seemed to expect that something would happen—they knew not what, any more than their rulers. 'Among our Mussulman subjects,' says Mr Kaye, 'the feeling was somewhat akin to that which had unsettled their minds at the time when the rumoured advent of Zemaun Shah made them look for the speedy restoration of Mohammedan supremacy in Hindostan. In their eyes, indeed, the movement beyond the Afghan frontier took the shape of a Mohammedan invasion; and it was believed that countless thousands of true believers were about to pour themselves over the plains of the Punjab and Hindostan, and to wrest all the country between the Indus and the sea from the hands of the infidel usurpers. The Mohammedan journals, at this time, teemed with the utterances of undisguised sedition. There was a decline in the value of public securities; and it went openly from mouth to mouth, in the streets and the bazaars, that the Company's Raj was nearly at an end.'

Under these circumstances, it seemed necessary to look to the intervening country, Afghanistan, which in this summary manner was to be made a 'platform of observation' for the Perso-Russian army to prepare for its descent upon Hindostan. The Afghans were tribes of hardy mountaineers, inhabiting a wild and thinly-peopled country. They consisted of soldiers, husbandmen, and shepherds, all convertible, at a moment's notice, into thieves and bandits; and through their formidable defiles flowed an uncertain stream of commerce, connecting India with the distant provinces of Persia and Russia. So little was known of these mountaineers, that in the early part of this century, their prince, Shah Zemaun, was a formidable bugbear to the Indian Council, and nothing was thought of for a time but an invasion of the Afghans. In one of the sudden revolutions, however, so common in semi-barbarous states, this shah was taken captive, and his eyes punctured with a lancet—a summary act of deposition in the East, for a blind man cannot reign. Two of his brothers competed for the vacant throne; and notwithstanding the efforts of a famous king-making vizier, Futteh Khan, the prize fell for a time to the lot of him who is so well known to English readers by the name and style of Shah Soojah. But his incapacity was soon manifest. Sometimes a king, sometimes a bandit, and sometimes a fugitive subsisting by the sale of his jewels, his cause at length became altogether hopeless; and after being robbed of his last treasure, the Koh-i-Noor—as has already been detailed in this Journal*—he took refuge in the British territory.

Futteh Khan, the king-making vizier, had twenty brothers; but one of the younger fry he treated with especial neglect. 'The son of a woman of the Kuzzilbash tribe, looked down upon by the high-bred Douranee ladies

of his father's household, the boy had begun life in the degrading office of a sweeper at the sacred cenotaph of Lamech. Permitted, at a later period, to hold a menial office about the person of the powerful Wuzer, he served the great man with water, or bore his pipe; was very zealous in his ministrations; kept long and painful vigils; saw everything, heard everything in silence; bided his time patiently, and when the hour came, trod the stage of active life as no irresolute novice. A stripling of fourteen, in the crowded streets of Peshawur in broad day, as the buyers and the sellers thronged the thoroughfares of the city, he slew one of the enemies of Futteh Khan, and galloped home to report the achievement to the Wuzer. From that time his rise was rapid. The neglected younger brother of Futteh Khan became the favourite of the powerful chief, and following the fortunes of the warlike minister, soon took his place among the chivalry of the Douranee Empire.'

The name of this youth is well known in the annals of our time: he was Dost Mahomed, a gay, bold, frank, daring character, who rose from the excesses of his early years into something resembling a hero of romance. One of these excesses was committed when he had taken by assault the Palace of Herat. It consisted in tearing the jewelled waistband from the person of the wife of one of the royal princes—a terrible outrage in the eyes of these barbarous soldiers of the farther East, who, even when covered with blood, and loaded with rapine, cast down their eyes before the females of their enemies' household. In this case, the profaned garment was sent by the lady to her brother, the son of the then Afghan king, and a bloody vengeance followed, not upon the author of the outrage, but on the king-making vizier, who, falling into the hands of the prince whom he had himself placed upon the throne, was literally hacked to pieces. Dost Mahomed now rose like a rocket. The base and feeble remains of legitimacy seemed to die away of its own weakness, and the despised younger son of the king-making vizier soon reigned supreme at Cabool. Let us note that this was in 1826. The new king, says Mr Kaye, 'had hitherto lived the life of a dissolute soldier. His education had been neglected, and in his very boyhood he had been thrown in the way of pollution of the foulest kind. From his youth, he had been greatly addicted to wine, and was often to be seen in public reeling along in a state of degrading intoxication, or scarcely able to keep his place in the saddle. All this was now to be reformed. He taught himself to read and to write, accomplishments which he had before, if at all, scantily possessed. He studied the Koran, abandoned the use of strong liquors, became scrupulously abstemious, plain in his attire, assiduous in his attention to business, urbane and courteous to all.' In 1833, Shah Soojah, issuing from the British territory, made an abortive attempt to recover his kingdom; but Runjeet Singh, the ruler of the Sikhs, was more successful in wresting from him Peshawur, a province of Afghanistan, and Dost Mahomed, both in rage and terror, began to look around him for a foreign alliance. His grand aim was to secure the friendship of the British; but this was scornfully refused. The governor-general, with exquisite irony, replied to his overture: 'My friend, you are aware that it is not the practice of the British government to interfere with the affairs of other independent states' and a British envoy to Cabool, while refusing everything that was important for him to ask, kindly cautioned him to abstain from connecting himself with any other power.

Such was the position of affairs in Afghanistan when the government of India, in 1838, was roused to a sense of what seemed immediate danger by the movements in Central Asia. On the one hand, there was a *de facto* king, who had reigned twelve years, who was now struggling in the grasp of the ruler of the Punjab, and eagerly soliciting the alliance of the British; while

* See No. 291.

the Russians and Persians, leagued before Herat, were already negotiating for a footing in his country. On the other hand, there was a deposed exile, who had tried repeatedly, and in vain, to recover his throne, whose whole life had been a tissue of misfortunes and feebleness, and who now lived on the charity of the Company in their own territory. The obvious policy was to secure the independence of Afghanistan and aid her resources. How to do this? To embrace the proffered alliance of Dost Mahomed, or force Shah Soojah upon the country, and prepare for the reception of the Persians and Russians, by kindling a civil war? The latter was the course determined on! A league was formed, known in the history of our time as the Tripartite Treaty—including Runjeet Singh, Shah Soojah, and the British government. By this document, it was agreed that certain large portions of the Afghan territory, including Peshawar, should belong for ever to Runjeet Singh; that the maharajah should likewise possess the passes both of the Sutlej and the Indus, with power to bar the way at his pleasure; that the Afghans and Sikhs should mutually exchange military assistance when required; and that the friends and enemies of any of the three high contracting parties should be the friends and enemies of all.

There was not a word in this treaty, it will be seen, of a British war in Afghanistan; but the Indian government soon came to enlarge its views, and instead of merely patting Shah Soojah on the back, and setting him upon his countrymen, it determined to take the field in such force as would instantaneously settle the whole affair. The celebrated Simlah manifesto was accordingly drawn up, in which the governor-general gave 'his most exquisite reasons,' unpolitely stigmatised by a great portion of the Indian press as a tissue of falsehoods. With this, however, we have nothing to do; our business is with the fact, that before this proclamation had obtained general currency, information had been received that the siege of Herat was raised, and the Persian army on its retreat. This was awkward. The occasion of the intended British invasion of Afghanistan was at an end. No matter. A large and brilliant army was already assembled on the banks of the Indus, and the war must go on! Many persons from the first considered the result doubtful; and Shah Soojah himself had his misgivings, when he found that he was to be forced by Christian bayonets upon a nation of bigoted Mohammedans!

But although the change in the state of affairs in Central Asia made no change in the belligerent resolves of the Indian government, it determined them to reduce the size of the army, and so make a little war instead of a great one. Scarcely had the Army of the Indus, as it was called, begun its march through Scinde, when it was beset with difficulties. 'Between Sukkur and Shikarpoor the camels had dropped down dead by scores. But there was a worse tract of country in advance. The officers looked at their maps, and traced with dismay the vast expanse of sandy desert, where no green pasture met the eye, and no sound of water spoke to the ear. But the season was favourable. Escaping the arid and pestilential blasts of April and May, and the noxious exhalations of the four succeeding months, the column advanced into Cutch. The hard, salt-mixed sand crackled under their horses' feet, as the general and his staff crossed the desert, on a fine bright night of early March—so cool, that only when in a full gallop the riders ceased to long for the warmth of their cloaks. The distance from Shikarpoor to Dadur is a hundred and forty-six miles. It was accomplished by the Bengal column in sixteen painful marches. Water and forage were so scarce, that the cattle suffered terribly on the way. The camels fell dead by scores on the desert; and further on, the Beloochee robbers carried them off with appalling dexterity. When the column reached a cultivated tract of country, the green crops were used

as forage for the horses. The *ryots* were liberally paid on the spot; but the agents of the Beloochee chiefs often plundered the unhappy cultivators of the money that had been paid to them, even in front of the British camp.' The Bolan Pass was more formidable. 'The stream of the Bolan river was tainted by the bodies of the camels that had sunk beneath their loads. The Beloochee freebooters were hovering about, cutting off our couriers, murdering stragglers, carrying off our baggage and our cattle. Among the rocks of this stupendous defile, our men pitched their tents, and toiled on again day after day, over a wretched road, covered with loose flint-stones, surmounting, at first by a scarcely perceptible ascent, and afterwards by a difficult acclivity, the great Brahoo chain of hills. The Bolan Pass is nearly sixty miles in length. The passage was accomplished in six days. They were days of drear discomfort, but not of danger. A resolute enemy might have wrought mighty havoc among Cotton's regiments: but the enemies with which now they had to contend were the sharp flint-stones, which lamed our cattle; the scanty pasturage, which destroyed them; and the marauding tribes, who carried them off. The way was strewn with baggage, with abandoned tents and stores; and luxuries, which a few weeks afterwards would have fetched their weight twice counted in rupees, were left to be trampled down by the cattle in the rear, or carried off by the plunderers about them.'

These disagreeables were surmounted; Soojah was installed at Candahar; Ghuznee was captured in gallant style—when fifty prisoners were hacked to pieces by orders of the shah; Dost Mahomed was beaten wherever he shewed himself; and, finally, our victorious army arrived at Cabool. Glorious victories are always highly appreciated in England. The chief actors in this expedition were rewarded with titles of earl, baron, baronet, and knight; and 'all went merry as a marriage-bell.' Not, however, but that there were moments of misgiving among the conquerors at Cabool. Dost Mahomed, though beaten, was not subdued, and his repeated small successes made him almost formidable. But even this was at an end, and the Dost surrendered himself prisoner.

The British force remained in Cabool two years, where officers and men alike misconducted themselves, as soldiers always do in a conquered country. The exasperation of the natives became more and more manifest: Akbar Khan, a son of Dost Mahomed, hovered about the country, the evil genius, as it is supposed, of the rising storm; and at length an insurrection broke out in the city. In this tissue of surprising blunders, perhaps none is more remarkable than the facts, that the general selected to command an army so critically placed was a poor old man, feeble in body and mind, and that the wives and children of many of the officers were present with their husbands and fathers, as if the causeless invasion of a country, and the massacre of thousands of its inhabitants, had been a party of pleasure! The moment of retreat at length came; snow covered the ground; the dreary passes of Khoord-Cabool were before them; and as they turned their backs upon the city, they were saluted with farewells volleys of musket-bullets.

The story of this fatal retreat has been often told. The result was communicated in the following manner to the British troops shut up in Jelalabad: 'At last, on the 13th of January, when the garrison were busy on the works, toiling with axe and shovel, with their arms piled and their accoutrements laid out close at hand, a sentry on the ramparts, looking out towards the Cabool road, saw a solitary white-faced horseman struggling on towards the fort. The word was passed; the tidings spread. Presently the ramparts were lined with officers, looking out, with throbbing hearts, through unsteady telescopes, or with straining eyes tracing the road. Slowly and painfully,

as though horse and rider both were in an extremity of mortal weakness, the solitary mounted man came reeling, tottering on. They saw that he was an Englishman. On a wretched, weary pony, clinging, as one sick or wounded, to its neck, he sat or rather leant forward; and there were those who, as they watched his progress, thought that he could never reach, unaided, the walls of Jelalabad. A shudder ran through the garrison. That solitary horseman looked like the messenger of death. Few doubted that he was the bearer of intelligence that would fill their souls with horror and dismay. Their worst forebodings seemed confirmed. There was the one man who was to tell the story of the massacre of a great army. A party of cavalry were sent out to succour him. They brought him in wounded, exhausted, half-dead. The messenger was Dr Brydon, and he now reported his belief that he was the sole survivor of an army of some 16,000 men!*

From this wholesale butchery, which we are not disposed to detail, the women and children, the general, and the husbands of the ladies, were rescued by Akbar Khan. They were held for a time by the son of Dost Mahomed in a sort of captivity; where some of them had leisure to write narratives of their adventures, while others, with an inconsistency common and entertaining in melodramatic pieces, amused themselves with fun and frolic!

And what became of Shah Soojah? 'Rising early on the morning, he arrayed himself in royal apparel, and, accompanied by a small party of Hindostanees, proceeded under a salute, in a chair of state, towards his camp, which had been pitched at Soeah-Sungh. But Soojah-ool-dowlah, the son of the Newah, had gone out before him, and placed in ambush a party of Jezailchees. As the shah and his followers were making their way towards the regal tent, the marksmen fired upon them. The volley took murderous effect. Several of the bearers and of the escort were struck down, and the king himself killed on the spot. A ball had entered his brain. Soojah-ool-dowlah then rode up; and as he contemplated his bloody work, the body of the unhappy king, vain and pompous as he was to the very last, was stripped of all the jewels about it—the jewelled dagger, the jewelled girdle, the jewelled head-dress—and it was then cast into a ditch.'

It was of course impossible for the Company to suffer the blot upon their arms to remain: indeed, their safety in India required that no tarnish of defeat should rest permanently upon their name. The British troops at Candahar and Jelalabad were ordered to march upon Cabool, where, as an enduring mark of the retributory visit, in addition to pillaging the shops, setting fire to the houses, and murdering the unresisting inhabitants, they destroyed—not the fortress—but the *bazaar*, the great commercial depot of Central Asia!

The objects of the war were now accomplished. But Shah Soojah was dead. The king we had driven from the throne, however, was still alive: Dost Mahomed, therefore, was restored; and nothing remained to be done, since the grand drama had been brought to a conclusion, but to celebrate the happy *dénouement* by a *fete*. This, accordingly, came off at Ferozepore. 'Then there was feasting and festivity in the gigantic tents, hung with silken flags, on which, in polyglot emblazonments, were the names of the actions that had been fought; many complimentary effusions, in the shape of after-dinner harangues; and in the mornings grand field-days, more or less, according to the "skye influences." The year—a most eventful one—was closed with a grand military display. The plain was covered with British and Sikh troops, and in the presence of Pertaub Singh, the heir-apparent of Lahore; Dhyen Singh, the minister; the governor-general, the

commander-in-chief, and others of less note, some 40,000 men, with 100 guns, were manœuvred on the great plain. On this grand tableau the curtain fell; and the year opportunely closed in gaiety and glitter—in prosperity and parade.'

We have now concluded our task, but without having been able to convey even a faint idea of the stores of information that are contained in these valuable volumes. They are destined, however, to retain a permanent place among the books of reference which enrich our national literature, and contribute to its advancement.

OCCASIONAL NOTES.

TENACITY OF LIFE IN INSECTS.

HOWEVER useful insects may be in the general economy of nature, it is but too true that farmers and gardeners often find them a pest, and with each returning summer the pages of agricultural journals abound with remedies, offensive and defensive, against the obnoxious invaders. In such cases, it becomes desirable to know what remedial means are the most efficacious, and we are glad to find that the question has been taken up by persons competent to discuss it. Among these, Dr J. Davy has given the results of his inquiry in a paper, 'On the Effects of certain Agents on Insects,' which has just been published in the *Transactions of the Entomological Society*, and is well worth reproduction in a condensed form. The experiments were begun in the winter of 1850, the season, as will be remembered, being so mild that insects were readily met with. Their objects were threefold—to test the effects of temperature, of gases, and of vapours. In the former, recourse was had to extremes of heat and cold. A bee placed in a temperature of 32° became at first more active, but the next morning was found torpid, as if dead; a register-thermometer shewing that 25° had been the lowest temperature during the night. Transferred to a temperature of 52°, the bee revived in half an hour, and on the following day exhibited the same results under the same conditions. A fly which, on December 8, was lively on the wing, in a temperature of 52° indoors, was disinclined to move at 40°; and still more so, stirring only when touched, at 33°, but did not become torpid, as in the case of the bee, even at 23°, signs of life being distinctly visible. Several trials made with different species of flies all gave the same result—a remarkable power of sustaining life. The method adopted was to enclose the insects in a glass tube, and place them out of doors all night; and though the tube was frequently covered with frost, they soon revived in the warm temperature of a room. It is perhaps scarcely possible to estimate the degree of cold which insect life will bear without destruction, since many of these creatures survive the terrible winters of the arctic regions. Still, a knowledge of the effects of reduction of temperature will be valuable, as affording data by which to judge of the effects and probable duration of visitations of insects, and of the nature of the precautionary measures to be adopted. In an experiment of alternate temperature from 40° to 65° tried for five days on a bee, the creature at last 'ceased to give any sign of vitality.'

The influence of heat appears to be much more rapid than that of cold: a fly exposed to a temperature of 120°, died in two or three minutes; and 118° proved fatal to another; while a third, placed in a temperature increased gradually to 96°, remained alive for more than an hour. Others bore from 80° to 90° for two hours; and in one instance, a fly survived from 86° to 100° for several hours, but became uneasy with a slight rise, and died at 105°. A bee, taken on March 15, from a temperature of 45°, was exposed to 80° without any apparent diminution of activity; at 90° it ceased to buzz; and at 96°, ceased altogether to

* A sketch of this famous retreat will appear in a forthcoming volume of *Chambers's Pocket Miscellany*.

move, and did not revive. Although these results are too few to enable us to determine the laws with respect to the influence of temperature on insects, they may serve a purpose, in shewing that the effect is not that gradual one of hybernation, where activity and torpor succeed each other but slowly.

In the series of experiments with gas, it was found that flies placed in carbonic acid gas became instantly motionless, and died if left for any length of time. Some revived after an hour's immersion; others, after two or three hours—the revival being slow in proportion to the time of exposure to the gas. Somewhat similar results were obtained with flies and bees in hydrogen and azote. To try the effect of deprivation, a fly was shut up in a tube with but a small quantity of common air, on the 5th February, in a temperature varying from 52° to 60° during the whole time of the experiment. The insect manifested no uneasiness until the 25th day, and was found dead on the 28th. Another fly, enclosed in a similar tube, with a quantity of air not more than a few times its own volume, became languid on the second day, and motionless on the twelfth, but revived on being taken out.

Flies immersed in oxygen were found dead the second day, with a diminution of the quantity of the gas. Coal-gas produced almost immediate insensibility, with a few feeble attempts at revival, but in no case effectual. Sulphuretted hydrogen also proved especially fatal—an instant's immersion was sufficient to destroy life; though withdrawn at once, not one of the flies recovered. It was the same when the portion of gas diffused in the air of the tube was so minute as to be scarcely appreciable. On bees, too, the effect was similar; the deadly nature of the gas on their delicate organisation being invariably destructive. Like results were obtained with chlorine.

In the class of vapours, ammonia proved fatal in one case, and harmless in another; muriatic acid stupified in two, and killed in twenty-four hours. The vapour of nitric acid was equally fatal with sulphuretted hydrogen; and, in alcoholic vapour, at a temperature of 74°, 'for a few minutes the fly shewed increased activity; in a few more, it became nearly motionless; after about a quarter of an hour, it appeared to be torpid. Now, exposed to the air of the room, in a few minutes a slight motion of its feet was seen; after a couple of hours, it was nearly as active as before the experiment; two hours later, it was found dead.' The same effects, with slight variations, were produced on other flies. With ether, cessation of motion was almost instantaneous, followed, however, by revivification, except in one instance: brief immersion in chloroform did not prevent revival, but an exposure of eight minutes killed: camphor and turpentine were both fatal: with attar of roses, musk, or iodine, no ill effect was perceptible.

The experiments with prussic acid are worthy the attention of entomologists, with whom it is often a matter of importance to kill an insect with the least possible amount of injury. In these instances, the plan pursued was to charge a small tube with the acid, and place it inside that containing the insects. The vapour of 1-16th of a grain was sufficient to destroy bees and flies; and that of seven grains proved fatal to large beetles, and the largest kind of bees. Although as yet the investigation has taken but a limited range, it will be seen that it opens a wide field of research: the next step will be to group or class those agents which appear to have produced similar effects. It is remarkable, as Dr Davy observes, 'that most of the substances which, even in minute portions mixed with common air, prevent the slow combustion of phosphorus, as indicated by its shining in the dark, have the effect, on the insects on which they were tried, of suspending animation.'

He says further: 'Some of the results may not be undeserving notice for practical purposes—as those in the

instances of sulphuretted hydrogen, oil of turpentine, and camphor, in relation to the destruction of parasitical insects, whether infesting plants or minerals, or to the preservation of substances from the attacks of insects. To be applicable to the preservation of plants, of course it is necessary that the agents to be used should not exercise on them any materially injurious effects. This must be determined by experiments made expressly for the purpose. The few trials I have yet made on seeds seem to shew, that the steeping them in a solution in water of sulphuretted hydrogen has not prevented their germination. The seeds tried were mignonette, cress-seed, and that of a *Nemophila*: analogy—namely, that of steeping the seed of the cerealia in a solution of the white oxide of arsenic, is in favour of the same conclusion. Further, for the preservation of articles, whether of clothing or furniture, it is hardly less necessary that the substances to be employed should have no offensive odour. Judging from the effects of attar of roses, and from what we know of scented woods not being liable to be attacked by insects, the probability is, that any volatile oil of agreeable perfume will answer the purpose required, and prove a true instance of the *utile et dulce* combined.

'As carbonic acid gas, and some of the other agents mentioned, produce merely a temporary torpor, it may be a question whether this gas, or simple immersion in water, may not be advantageously substituted for the fumes of burning sulphur, destructive of life, at the yearly gathering of honey; the former, indeed, may be said to be in use in the Levant, where the smoke of the fire of leaves, in which the carbonic acid generated may be considered as chiefly operative, is employed to stupify the bees preparatory to the spoiling of their hives.'

CHILDREN SUCKLED BY WOLVES.

This subject is one which will not be unwelcome to those whose faith in the myths of Roman history has been dissipated by Niebuhr and others: they may still believe the story of Romulus and Remus and the wolf. The Honourable Captain Egerton, in a communication from India, says: 'Colonel Sleeman told me one of the strangest stories I ever heard relating to some children, natives of this country (Oude), carried away and brought up by wolves. He is acquainted with five instances of this, in two of which he has both seen the children and knows the circumstances connected with their recapture from the animals. It seems that wolves are very numerous about Cawnpore and Lucknow, and that children are constantly carried off by them. Most of these have, of course, served as dinners for their captors, but some have been brought up and educated by them after their own fashion. Some time ago, two of the king of Oude's sowars (mounted gendarmes), riding along the banks of the Goomptje, saw three animals come down to drink. Two were evidently young wolves, but the third was as evidently some other animal. The sowars rushed in upon them, captured the three, and to their great surprise found that one was a small naked boy. He was on all-fours, like his companions; had callosities on his knees and elbows, evidently caused by the attitude in moving about; and bit and scratched violently in resisting the capture. The boy was brought up in Lucknow, where he lived some time, and may, for aught I know, be living still. He was quite unable to articulate words, but had a dog-like intellect—quick at understanding signs, and so on. Another *enfant trouvé*, under the same circumstances, lived with two English people for some time. He learned at last to pronounce the name of a lady who was kind to him, and for whom he shewed some affection; but his intellect was always clouded, and more like the instinct of a dog than the mind of a human being. There was another more wonderful, but hardly so well-authenticated, story of a boy who never

could get rid of a strong wolfish smell, and who was seen, not long after his capture, to be visited by three wolves, which came evidently with hostile intentions, but which, after closely examining him—he seeming not the least alarmed—played with him, and some nights afterwards brought their relations, making the number of visitors amount to five—the number of cubs which composed the litter from which he had been taken. There is no account of any grown-up person having been found among the wolves. Probably, after a certain time, the captives may have got into a set of less scrupulous wolves, not acquainted with the family: the result is obvious.

ELECTRO-MAGNETIC MACHINE.

The electro-magnetic machine invented by Professor Page, has from time to time been noticed in our Journal, and we have now to give a further account of this interesting mechanism, as furnished by an American periodical. It appears that several of these machines have lately been submitted to critical examination by competent authority at Washington, and with very favourable conclusions. The principle has already been explained—namely, the alternate rising and falling of an iron rod within a helix through which an electro-magnetic current is made to pass: when the current is on, the rod rises, and remains, as it were, self-suspended, equidistant from all parts of the surrounding helix; and falls as soon as the current ceases by breaking contact with the battery. The 'rod' of one of the machines submitted to the examination weighs 850 lbs.: no sooner, however, was contact made, than it rose into its position. 'Dr Page then stood on the top of the rod, which not only sustained his weight, in addition to its own, but he pushed with his hands against the ceiling, increasing the downward pressure on the rod, which was only acted upon as a powerful spring would have been, but still maintaining its perpendicular position concentric to the inner surface of the helices. I held,' says the reporter, 'an iron rod in my hand, with the end of which I touched that of the suspended rod. I could not detach it by pulling or jerking, and could only alter its position so as to cause the annular space to become eccentric instead of concentric. The instant the battery was disconnected, the rod fell to the floor with its full force.'

By moving the wires from the battery up and down outside the pile of helices, it was clear that an upward and downward movement of the rod would follow, 'and that a shackle-bar attached from this oscillating rod, and to a crank, would convert this reciprocating motion into a continuous one.' To this contrivance the name of 'Jumper' was given, of which one was exhibited, the helices weighing 800 lbs., and the rod 626 lbs.; and by the means above mentioned, it has been converted into a working-engine, with a twelve-inch crank, and a fly-wheel of four and a half feet in diameter. 'On the outside of the helices,' to quote the description, 'was placed a line of pieces of metal, so arranged as to render the attachment with the battery and its necessary alternations performable by the engine itself. Before starting the engine, I tied an arm of the fly-wheel, at one-third greater distance from the centre than the length of the crank, to an upright beam of twelve inches diameter, which formed part of the frame of the engine. The cord used was the better kind of bed-cord, of great strength, nearly three-eighths of an inch thick. This was passed twice round the fly-wheel arm and post before being tied, and with pieces of sole-leather intervening, to prevent the cord being cut by the corners of the post. Such a fixture, I am confident, would have held a five horse-power steam-engine from starting, with full pressure of steam on the piston, and no previous motion. Not so, however, with this engine, for the breaking of the cord and contact with the battery occurred at the same instant

of time, leaving an impression in the beam to the depth of the cord, despite the protection of the sole-leather.' The engine continued to work in the most satisfactory manner; and Dr Page attached a circular-saw, which was used in wood, to a depth of six inches, and at a speed such as could be anticipated from the power which we afterwards found the engine to possess.

Careful experiments made to test the power of the engine, shewed it to be equal to seven horse nearly; and the estimate for consumption of acid and use of zinc is twenty cents for each horse-power per day of twenty-four hours. The escape of acid vapours from the batteries is an evil that will have to be guarded against, to prevent the pernicious effects produced in several electro-plating establishments, where the health of the workmen has been seriously injured by the liberated gases. This defect being overcome, Professor Page's electro-magnetic engine may become highly valuable in engineering and manufacturing processes. To quote the conclusions of the report—'the cost will be less than that of a steam-engine of the same power: the weight will be but one quarter, if boilers and contents be taken into account: the expense of firemen and engineers is dispensed with: buildings, and stocks of goods, and vessels may be more cheaply insured than when steam-engines are used, as there could be no risk from explosion or fire: the expenses are only active while the machine is positively in action, whereas an ordinary steam-engine continues its expenses whenever the fire is burning.

'Dr Page's engine, if used ten times during the day, of six minutes each time, would have but one hour's expenses for the day; whereas a steam-engine, under similar circumstances, would be subject to nearly or quite the full expenses of fuel for twenty-four hours, or equal to the expenses of continuous work.'

THE SCIENCE OF COLOUR IN DRESS.

Unfortunately for our health and comfort, the teachings of science are too often disregarded, if they interfere with our habits. Science, when not practically applied, loses its value; it wants fixedness, stability. Its application is its embodiment; without it, it is a mere figment of the brain. Its business is to inform the mind, and remove erroneous impressions; and its highest aim is usefulness. The popular belief with respect to dress, that a black dress is warmer, both in winter and summer, than a white one, is erroneous. The truth is that, the material being the same, a black dress is cool in winter and warm in summer—while a white one is warm in winter and cool in summer; that is to say, the one is cool when we require warmth, and warm when we require to be cooled; while the other is warm when we are cool, and cool when we are warm, and thus answers the purpose of dress, which is, to protect the body from the influence of the weather.

Science teaches that dark colours absorb heat, and part with it much more rapidly than light ones; black and white being the two extremes. How strange that this knowledge has not been applied to dress! If the bowls of two spoons, the one polished, and the other smeared with soot, be held near a fire, it will be found that the blackened one becomes hot much sooner than the other; and if now they be both made hot by holding them against the bars of the grate, and then removed from the fire, and suspended in the air, it will be seen that the blackened one will get cool much sooner than the other. It is true that the difference in this case is chiefly due to the polish on one of the spoons, but it is not altogether due to it. Again: if hot water be poured into two vessels, the one white and the other black, the water in the latter will cool before the other. So likewise if two persons, one dressed in black and the other in white—all other conditions being the same—were to go from the cold external air into a heated room, the one in black would

feel the heat sooner than the other, and on leaving the room would feel the cold sooner; consequently, would be more likely to take cold than the other. It is therefore evident that a light-coloured dress is more conducive to health and comfort than a dark one, since it prevents the external heat or cold from too suddenly reaching the body, and prevents the body from too suddenly parting with its heat; and thus, that it keeps it in a more equable temperature.

We may now understand the reason why animals in the polar regions are white—their whiteness preserves the heat of their bodies much better than any other colour. So likewise the earth, in consequence of the whiteness of snow, is prevented from parting with its heat. It is not so much by snow protecting the earth from the external cold, that it does such valuable service, as by its preventing the radiation of the internal heat. This whiteness of snow, and of the polar animals, must not be looked upon as the result of blind chance: it strikingly exemplifies the wisdom and goodness of the Creator.

The above observations are peculiarly applicable to the case of men engaging in arctic expeditions. I do not know what dress they usually wear, but it is quite clear that a white woollen one would be the most appropriate; and if it had a gloss upon it, it would be so much the better. This they might have learned from observing the animals in those regions.

DIBDIN'S SAILOR-SONGS.

In a recent article in this Journal,* we gave our opinion of practical sea-life, and incidentally alluded to the songs of Dibdin. The paper excited some interest; and we may, therefore, venture to say a little more about these celebrated songs, concerning which the public in general has always had, and still has, a very erroneous impression.

We commence with an assertion which will startle many—namely, that Dibdin's songs never were, are not, and never can be, popular with sailors. About six years ago—if we recollect rightly as to date—the Lords of the Admiralty, considering that Dibdin's songs had always been 'worth a dozen pressgangs,' as the common saying is, ordered that twenty of the best songs should be printed on strong paper, and presented to every man and boy in the royal navy. This act, however, is not so much to be regarded as a strong evidence of the private opinion of the nautical magnates in question—but the chief of them is invariably a *landman*—as of their deference to the force of public estimation on the subject of the songs. Let it not be thought, from the tenor of our subsequent remarks, that we ourselves are at all prejudiced against Dibdin. So far is it the reverse, that we were brought up from childhood 'in belief' of that gifted lyricist: our father repeated to us in early life his finest songs, and we have never ceased to regard him with sincere admiration. He was a man of true genius in his peculiar walk, and it has been well and truly said of him, that, 'had he written merely to amuse, his reputation would have been great; but it stands the higher, because his writings always advocate the cause of virtue: charity, humanity, constancy, love of country, and courage, are the subjects of his song and of his praise.'

Dibdin himself was not a sailor, and his knowledge of sea-life, of seamen, and of sea-slang, is generally attributed to the instructions of his brother, the master of a ship. This brother was subsequently lost at sea, and Dibdin is said to have written *Poor Tom Bowling* as his elegy. Dibdin's sea-lore was, therefore, altogether second-hand and theoretical; and his songs, on the whole, present an idealised and exaggerated embodiment of the characteristics, life, and habits of seamen; but it is

wonderful how accurately and skilfully he introduces allusions to sea-manceuvres, and how very rarely he errs in nautical technicalities. They were written in war-time, when the nation was excited to a pitch of frenzied enthusiasm by a succession of unparalleled naval victories—when a prince of the blood trod the quarter-deck, and Nelson was 'Britannia's god of war.' Their popularity with *landsmen* was then incredible. Everybody sang Dibdin's sea-songs, deeming them a perfect mirror of sea-life and seamen's character. The truth is, he has exaggerated both the virtues and the follies of sailors to an absurd degree; and his blue-jacketed heroes are no more to be accepted as a fair type of sailors, than are Fenimore Cooper's Chingachgook and Leatherstocking as types of the Red Men and trappers of North America. Herein, we conceive, is the primary cause of Dibdin failing to enlist strongly the sympathies of real blue-water tars; and the very same reason, with some modifications, prevents all prose works, descriptive of sea-life, from being favourably received by practical mariners. We have heard the 'sailing' portions of the finest works of Cooper and others scoffed at by seamen; and the very best book on sea-life ever written, Dana's *Two Years before the Mast*, is held in no sort of esteem by the very men for whose benefit the author avows he wrote it, and whose life he has so vividly, and, as we think, faithfully described. Every sailor we have questioned concerning that book—and there are few sailors who have not read it—declared that he 'thought nothing of it;' and that all his messmates laughed at it as much as himself. They say that Dana 'makes too much' of everything, and that he gives false and exaggerated notions of life on shipboard. We personally deny this; but sailors, as a body, are such prosaic people, that they will make no allowance whatever for the least amplification of bald matter of fact. If the author dilates at all on his own feelings and impressions, they chuckle and sneer; and if he errs in the least—or the compositor for him—in his nautical details, they cry out that he is a know-nothing, a marine, a horse-jockey, a humbug. To please seamen, any book about their profession must be written precisely in the lucid and highly-imaginative style of a log-book—their sole standard of literary excellence.

Sailors are shrewd and sensitive enough in some respects. They do not like to be flattered, and cannot bear to be caricatured; and they feel that Dibdin has—unconsciously—been guilty of both towards them. According to his songs, sailors lead a life of unalloyed fun and frolic. He tells us nothing about their slavery when afloat, nothing about the tyranny they are frequently subjected to; and in his days, a man-o'-war was too often literally a floating pandemonium. He makes *landsmen* believe that Jack is the happiest, most enviable fellow in the world: storms and battles are mere pastime; lopped limbs and wounds are nothing more than jokes; there is the flowing can to 'sweet-hearts and wives' every Saturday night; and whenever the ship comes to port, the crew have guineas galore to spend on lasses and fiddles. In fine, both at sea and ashore, according to his theory, jolly Jack has little to do but make love, sing, dance, and drink—grog being 'his sheet-anchor, his compass, his cable, his log;' and in the *True British Sailor*, we are told that 'Jack is always content.' Now, Jack knows very well this is all 'long-shore palaver, and he gives a shy hail to such palpable lime-twigs. 'Let the land-lubbers sing it!' thinks he; 'I'll none on't!'

Dibdin takes the first sip of his *Flowing Can* with the ominous line—

'A sailor's life's a life of wo!'

But what follows?—

'Why, then, he takes it cheerily!'

A pleasant philosophy this; but we happen to know

* See The 'Romance' of Sea-Life, No. 414 of the Journal.

that sailors do *not* take cheerily to 'a life of wo'—they would be more than men if they did. He talks coolly about times at sea when 'no duty calls the gallant tars.' We should very much like to know on board what 'old barkey,' and in what latitude and longitude, this phenomenon happened, and would have no particular objection to sign articles for a voyage in such a *Phoenix* of a ship; for in all the vessels we ever were acquainted with, there was never such a thing heard of, as 'nothing to do.' As to 'Saturday nights' exclusively devoted to pledging 'sweethearts and wives' over a flowing can in the fore-castle, we are sorry to say, we regard that as little better than a poetic myth.

Doubtless, at the time Dibdin's songs were written, sailors sang them to a considerable extent, for the public enthusiasm would in a way compel Jack to acquiesce in these eulogies on himself; but the said Jack never took them fairly to heart—how could he, when every voyage he made must have given the lie to many of these glowing pictures of life at sea? And from that time to the present, Dibdin's songs have gradually been forgotten among seamen, till, at this day, we question whether there is a foremast-Jack afloat who can sing half-a-dozen of them; and, probably, not many men aboard merchantmen know more than one or two songs of the hundred in question, although they may recollect fragments of several.

Dibdin's songs might be 'worth a dozen pressgangs' for manning the navy in war-time, and, for aught we can predicate to the contrary, they may be so again; but we reiterate our conviction, that they never caused sailors to ship aboard a man-o'-war. Landsmen might volunteer by scores through the influence of such stirring, patriotic ditties; but seamen, who 'knew the ropes,' would never be induced to ship through their agency.

Dibdin does ample justice to the bravery, the generosity, the good-humour, the kind-heartedness of sailors; and, as a class, they deserve his encomiums. His songs abound with just and noble sentiments, and manly virtues were never more constantly and strikingly enunciated by any author. We dearly love Charles Dibdin for this; and as a writer of popular lyrics, we class him as the very first England has ever produced. In this department of literature, we consider he holds the same place in England as Burns does in Scotland; Béranger, in France; Freiligrath, in Germany; and Hans Christian Andersen, in Denmark.

The reader will now ask: 'What songs do sailors sing?' We answer, that their favourite *sea-songs** are the most dismal, droning doggerel it is possible to conceive; and yet they relish them mightily, because they are stern matter of fact, and in most instances are descriptive of a battle, a chase, a storm, or a shipwreck—subjects appealing powerfully to their sympathies. The following may be taken as a tolerably fair specimen of the style of the genuine 'sailors' songs:—

'It was the seventeenth day of May, in the year 'ninety-six,

Our *taut* frigate the *Ajax*, she from Plymouth did set sail;

Eight days out, com'd a squall from north-east by north,
And then by four bells, morning-watch, it did freshen to a gale.'

Perhaps the most universally popular song among seamen is *Rule Britannia*; but in general they do little more than sing the chorus, and the way in which a crew of tars, when half-seas-over, will monotonously draw out 'Britons never, never, never shall

be slaves!'—repeating it over and over again, as if they never could have too much of a good thing—is highly amusing. We believe that a decided majority of the songs sang in the fore-castle are not *sea-songs* at all, but purely land-songs; and, strange to say, the most popular of these are sentimental ditties, such as were, a score of years ago, drawing-room favourites! It is very rich to hear 'ancient marinere,' rough as bears, hoarsely quavering, *I'd be a butterfly!* or, *O no! we never mention her;* or, *The days we went a-gipsying, long time ago!* They are also very partial to songs about bandits and robbers.

Well, after all, we have often, when in a tight craft, tossing amid howling billows, complacently repeated—and perchance shall again—the closing lines of *The Sailor's Consolation*, which, we believe, but are not certain, Dibdin wrote—

'Then, Bill, let us thank Providence
That you and I are sailors!'

'SEWED MUSLINS.'

UNDER the above technical name is produced in Glasgow a manufacture little known beyond the sphere of those immediately engaged in the business, the importance of which, however, as a means of employment to the poorer Scotch and Irish peasantry, renders it deserving of more attention than it has hitherto received. Sewed muslins include all those articles which are composed of muslin with a pattern embroidered on it by the hand—such as collars, sleeves, chemisettes, &c. together with the long strips of embroidery used, like laces, for trimming dresses, petticoats, &c. and called, technically, trimmings. The manufacture of these articles in the form in which they are now used was for a long period peculiar to France, and that country alone supplied all the rest of the world with the limited quantities which the high cost permitted to be consumed. An embroidered collar, thirty-five years ago, was an article of luxury only attainable by the rich, while the far greater part either dispensed with it altogether, or contented themselves with one of plain muslin or cheap net. Soon after that period, the rudiments of the manufacture began to be established at Glasgow, where for some time it made but moderate progress, and was confined to the production of a very low class of goods, leaving still to the French all the finer and more tasteful departments of the trade. During the last ten years, however, the progress has been very rapid; and now it supplies abundantly, with cheap and good embroidery, the whole British and American demand, to the almost total exclusion of both French and Swiss work.

The process by which a perfect piece of embroidery, delicately worked in a graceful pattern, and as white as snow, is produced, is far more complicated than might be imagined. The simple plan by which industrious ladies work a single collar on a traced pattern, with clean hands in a pure atmosphere, will not do when hundreds of thousands of collars are to be made, at the lowest rate, by poor children, in smoky hovels. In order to understand the matter clearly, it may be as well to transport ourselves to one of the large establishments in Glasgow, in whose extensive, well-lighted lofts the whole mechanism of the manufacture may be seen at work.

In the highest room, where the best light is obtained, we find a number of men, seated at small tables at the windows, engaged in drawing patterns. These are the designers, whose business it is to produce a constant and rapid succession of new patterns, either original or adapted from the French designs, which lie scattered on their tables. They are a very intelligent class, possessing considerable originality, and, what is even more important, thoroughly understanding the art of

* We must explain that the *working-songs* of seamen—or such as they sing when heaving at the pawl—windlass, catting the anchor, and other heavy pieces of work—are of a different class altogether, and consist chiefly of a variety of appropriate choruses to lively and inspiring tunes. These songs sound well, and are worth anything on shipboard, for they stimulate the men far more than grog would do with only a dead, silent heave or haul.

practical adaptation of costly designs to the necessities of the manufacture, without which the ingenious sketches of the French would be valueless. It is proper to add, that their powers of invention are steadily increasing year after year, and that the time is probably not remote when they will be independent of the Parisian designers.

The patterns sketched by them are transferred by the ordinary process to lithographic stones; and on entering the adjoining room, we find a large number of lithographic presses at work, some of great size. The unbleached muslin here receives the impression of the outline pattern, as paper is printed in the ordinary press; and the substitution of stones for the wooden blocks formerly used, has greatly cheapened and facilitated this process. The carved blocks were expensive to cut, and useless when the pattern was finished: the pattern is now put on the stone with great economy, and, the requisite number being struck off, is erased to make room for another.

The printed webs are now carried from the press-room to the floor below, where the green warehouse is situated—the common receptacle of the unbleached muslin going out to the working, and of the sewed goods coming in. The former are now made up into parcels, and sent off to the agents who are employed in the working districts to give out the work to the sewers, from whom they are again returned into the same department when sewed. We see them lying heaped in every direction, so saturated with dirt, that the pattern is hardly distinguishable from the muslin, looking and smelling as if no purative process could ever render them clean and sweet. The interval which elapses between the goods leaving the green warehouse and returning to it varies, with the nature of the goods, from a fortnight to six months; although occasionally pieces remain out much longer, and sometimes drop in after the lapse of years; while a per-centage are never returned at all, a loss which constitutes an item in the cost of the remainder. About three-quarters, at least, of all the embroidery is worked in Ireland; the remaining quarter being sewed in the south-western counties of Scotland. In Ireland, the sewing districts, at first confined to a very limited space in the neighbourhood of Donaghadee, have gradually spread, until the whole north, and even a portion of the western wilds of Connaught, have been covered with the agents of the Scotch and Irish manufacturers. There is every prospect that their extension will not stop here. It is requisite that the work should be performed at a very small cost; and from the position and habits of the Irish, they are able to work cheaper than the Scotch. The nature of the employment is also peculiarly fitted to them. It can be performed in their own cottages at leisure times, or by children, not otherwise useful. No cleanliness is required, as it matters not how dirty the piece is when finished; and the payments are prompt and in ready money. The remuneration is small, especially to children learning, and varies, according to the skill and industry of the worker, from 6d. to 5s. a week; but this is paid in cash immediately on the completion of the piece. It is easy to see what an important addition may thus be made to the means of a poor cotter, by the labour of the young children and girls, who would probably otherwise have no employment whatever.

The goods being fairly back in the green warehouse, the next process is to discharge the load of dirt contracted in the smoky mud-hovel, and restore the original snowy hue of the cotton. For this purpose they are sent out to what is termed a bleachfield, although those who should visit such a place in hopes of seeing a verdant lawn, strewn with the white folds of muslin waving in the summer breeze, would be grievously disappointed. A bleachfield is simply a huge steam wash-house, with red brick walls and a tall

chimney vomiting smoke, with not a particle of turf about it. Here, amidst volumes of steam, and the unceasing splash of water, the mirky mass is subjected to repeated agitations in hot and cold solutions, by means of revolving hollow wheels, inside of which the embroidery is tossed and tumbled for many days. A little chlorine is at last used, with much care, to complete the bleaching; and after a term, varying from ten days to three weeks, the goods are once more returned to the manufacturer, of a pure white, starched and dressed as may be required. We shall find them by walking from the green warehouse into the darning and ironing rooms where the final process of examination and finishing goes on, and whence they are turned out in a complete state into the saleroom, on the lowest floor of the establishment, to be disposed on long mahogany polished counters for sale. The extreme economy and method of this long process may be imagined when we are shewn very pretty collars, the entire cost of which—designing, sewing, muslin, bleaching, and profit—only amounts to 3d., yet including a rather elaborate pattern; while a yard of good serviceable edging is produced for 2½d.

The entire amount of the manufacture must of course be conjectural, but it has been estimated at about three-quarters of a million sterling a year. The principal part is sold in Glasgow, but a part of the Irish production is disposed of in Belfast. If we take, as the price of the work, two-thirds of the gross sum, the remaining third being cost of muslin, expenses, charges, and profit, we shall have £500,000 as the sum annually distributed, in ready money, in small sums over the south of Scotland and the north of Ireland—a most important addition to the resources of the rural population of those districts. In addition to this, a large class of workers, male and female, are employed in Glasgow in the preparation and in the finishing of the goods—as designers, lithographers, weavers, clerks, darners, ironers, and patterners. These are all well paid—some very highly; and the young women composing the three latter classes are remarkably well-to-do, prosperous class.

The growth of the manufacture has been much accelerated by the export-trade to the United States, where its superior cheapness and intrinsic excellence have induced a large consumption. Could we prevail on the French government to relax the prohibition which now bars its entrance into that country, a new and wide field would be opened for its extension, even at a pretty high duty; as the French manufacture, in its present state, is quite inadequate to supply the demand for cheap embroidery there. Even as it is, a good deal is smuggled in, and may be recognised by the experienced eye adorning the windows of the shops in Paris. An increased demand must tell immediately in favour of Ireland, the only place affording an increased supply of labour; and on this account, the prosperity and extension of the trade in sewed muslins must be an object of interest to all who desire the amelioration of the condition of the Irish peasant.

AN AMERICAN CONFESSES A FAULT.

THE Americans are said to be grievously addicted to —: we would rather avoid the word. Travellers have spread the imputation; but travellers are known to speak from prejudice, and their report did not appear to be altogether trustworthy. At length, strange to say, the charge of being intolerable—must we say it?—*spitters* is made by one of themselves, and of course there can be no more said on the subject: the fact is confessed. This marvellously candid, but painful acknowledgment, occurs in the recently-published work, *Sketches of European Capitals*, by W. Ware,

M.D., the well-known author of those charming historical romances, *Letters from Palmyra*, *Aurelian*, &c. We trust that Dr Ware will not be ostracised on the score of taste or patriotism by his countrymen, for his extraordinary audacity in telling them of a fault, and, what is more, in drawing an unfavourable comparison between them and Englishmen on this most delicate subject. The following are his remarks:—

'An Englishman, I believe, rarely chews, and, compared with the American, rarely smokes; but whether he does not secretly practise both these abominations, I am not prepared to say. But with both these provocatives, if it be so, one thing he never does—is to spit. That fact draws a line of demarcation between the Englishman and the American, broader and deeper a thousandfold than any other in politics, government, laws, language, religion. *The Englishman never spits*; or, if he does, he first goes home, shuts himself up in his room, locks his door, argues the necessity of the case; if necessary, performs the disagreeable duty, and returns to society with a clear conscience. The American spits always and everywhere; sometimes when it is necessary; always, when it is not. It is his occupation, his pastime, his business. Many do nothing else all their lives, and always indulge in that singular recreation when they have nothing else to do. Sometimes, in a state of momentary forgetfulness, he intermits; but then, as if he had neglected a sworn duty, returns to it again with conscience-smitten vigour. He spits at home and abroad, by night and by day, awake and asleep, in company and in solitude, for his own amusement and the edification of a spitting community; on the freshly-painted or scoured floor, on the clean deck of a ship or steam-boat, on parlour floors—covered whether with ingrained Brussels, Wilton, or Turkey—even there he voids his rheum; upon the unabsorbent canvas, so that one may see, where numbers congregate, the railway cars to run in more ways than one; the pulpits and pews of churches are not safe; the foot-pavement of the streets, the floors of all public places—of exchanges, hotels, of Congress halls—are foul with it; and in railway cars it must always be necessary for a lady to shorten her garments, as if about to walk in the deep mud of the street, or the snow and water of spring, if she would escape defilement to either her dress or her slippers. As the power of direction of these human missiles is by no means unerring, notwithstanding so much practice, one's own person, and all parts of his person, are exposed to the random shots of this universal foe of American civilised life; and often he finds, on different parts of his dress, proofs abundant of the company he has kept. The only single spot absolutely secure is a man's face—and that would not be, were it not for the fear of a duel. That there is not the shadow of exaggeration in this description, coarse as it is, and coarse as it has been my intention to make it, all Americans, and all travellers who have ever been within an American hotel, steam-boat, or rail-car—all will testify. And the result of it all is, I suppose, that we are the freest and most enlightened people on the face of the earth! But for one, republican as I am in principle, I think, on the whole, I would prefer the despotism of Austria, Russia, or Rome, to the freedom, if I must take with it the spit, of America. It is vice enough to tempt one to forswear home, country, kindred, friends, religion; it is ample cause for breaking acquaintance, friendship, for a divorce; in a word, it is our grand national distinction, if we did but know it. There are certainly parts of the country comparatively, but only comparatively, free from this vice. Here at the north, there is much less than at the west and the south, though here enough of it to disgust one with his nose. In proportion as general refinement prevails, the custom abates. At the south, no carpets, no rooms, no

presence, affords protection.* Here, in the best rooms, the best society, there is partial exemption, though not often enough from the presence of that ingenious, fearful patent—the brazen, china, or earthen box. Would that my country could be induced to pause in this its wonderful career! Pity some public effort could not be made by way of general convention, or otherwise, for the abatement of this national mischief—certainly as worthy of attention as very many of our political and moral reforms. The advice of the London surgeon, Abernethy, to an American sea-captain, was at any rate useful to us all, and pregnant with good medical philosophy. "Keep your saliva in your mouth to help to digest your food with," said he, "and do not spit it all over my carpet." Very wholesome counsel. And, seriously, who can say how much the pallid face, the proverbial indigestion of our country, even consumption itself, may not be owing to this constant drain, which deprives the stomach of a secretion which nature provided for the most important purposes in the manufacture of the blood, and which she certainly did not provide to be wasted and thrown about in the manner of the Anglo-American?'

There is so much frankness and sorrow in this confession of a national sin against good manners, that the least thing we can do is to assure Dr Ware, that he takes much too favourable a view of the habits of the English in the matter in question. That among the highly-educated, the refined, and in what is called 'good society' generally, no one is guilty of the crime he speaks of, is quite true; but we take leave to say that inferior grades of people—the bulk of those walking the street, for example—are about as guilty of it as are the Americans; and it must doubtless be from this source that our transatlantic brethren have been contaminated. This hint as to the origin of a bad practice may perhaps suggest amendment in those departments of our population where it is required. Might not something also be done in the way of school instruction?

'THE MAGNETOSCOPE.'

In No. 415 of this Journal, we printed a paper with the above title, merely as one likely to excite interest, but warning the reader that we did not ourselves vouch for its statements. This caution appears to have been very necessary; for Dr Madden—the substance of whose lecture was given in the article—now declares, that 'very shortly after its delivery, he, in common with many others, detected a serious fallacy in the whole series of experiments; and that, by prosecuting his inquiry in this new direction, he ascertained that not one of the hitherto recorded experiments can be looked upon as proving the existence of *magnetic currents* at all.' The pendulations, it seems, are caused solely by 'slight mechanical impulses, unconsciously or half consciously conveyed to the instrument by the luckless experimentalist.'

VILLAGE CLEANING.

It is a serious mistake to suppose that sanitary arrangements are required only for London and other large cities. Few small towns or even villages are exactly what they should be as regards health. Villages, indeed, by having no jurisdiction, are in many cases far more unhealthy than populous towns. We could point out a village of a few hundred inhabitants—a pretty place to look at, at a distance—where there is much mortality among infants and others in consequence of foul gutters and bad drainage. In a small pamphlet, forming an appeal to the ratepayers of Keswick on this subject, there occur the following

* 'Let six such Americans meet round a stove, in a bar-room, or parlour, or hotel drawing-room, of a morning—of the six, four will spit before speaking a word; one will bid good-morning first, and spit afterwards; the sixth will make a remark somewhat at length upon the weather, and, by way of compensation for extraordinary retention, spit twice or thrice.'

observations respecting the state of a place called Braithwaite, which we candidly believe might apply to a hundred other villages in England, and more particularly Scotland:—The village of Braithwaite, for example, contains, in proportion to its population, more dirt, disease, and death than any decent town. It is one of the most romantic and filthy villages in England, and yet it might easily be made one of the cleanest and neatest. There are lanes, alleys, and courts in almost all small towns and villages, in which the mortality is greater far than that of our great towns; nay, in hamlets, and isolated farm-houses in this, as in many other country districts, there is often more sickness in proportion to the population than in cities; and I could point out within a circuit of a few miles, localities in which, during the last few years, scrofula, small-pox, measles, and typhus fever have left their ravages; and which, with proper care and cleanliness, night, I firmly believe, have escaped. But that disease, and especially infectious disease, haunts all ill-drained, ill-cleaned, and ill-ventilated places in both town and country, there are now few intelligent persons that require to be convinced; and the question has come to be with the well-informed part of the public, as it has long been the question with medical men—has not the time now arrived to *compel* those who harbour the filth and the contagion that carry off one-half of mankind, to expel those enemies to the human race! The innumerable statistical inquiries of the last ten years on this subject, all go to prove that dirt, squalor, close air, and stagnant water, are the causes of one-half the mortality of mankind in civilised countries. The majority of thinking people of all classes—and these, though a small minority of mankind, are the directors of every great social movement—are coming to see that we must proceed with this sanitary business at once; and that, if not by mild means, then by a little wholesome compulsion, we must oblige the owners of property haunted by death and contagion, to yield to the demands of society. If a man may not harbour a ferocious bull-dog in his alley, is he to keep a noisome ditch running at large there?—and if he may not hold a main of fighting cocks, is he to keep cholera and typhus in his house! For my part, I cannot see, if a justice of the peace can stop a man from knocking me down with a bludgeon, why he should not be authorised to interfere to save me from a typhus fever; and if he can prevent boys from endangering the lives of passengers by firing guns on the high roads, why he should not also be enabled to forbid the open sewers and other nuisances, which, if not so noisy, are even more dangerous. A railway company pays heavily for the lives and limbs of passengers sacrificed by the neglect or rashness of its officials—should not a town be equally liable for the losses caused by a public violation of the laws of health! We move slowly in this neighbourhood, disliking changes, and hold strongly, while the rest of the world is advancing, to the old ideas; yet even Wordsworth's consecration of this sentiment to Cumberland—

"Hail usages of pristine mould,
And ye that guard them, mountains old!"

can scarcely apply to bad drainage and ventilation. We should think not. There is a scandalous deficiency in the ordinary institutes of the country on this important subject of town and village cleaning!

NATIONAL CUSTOMS.

Sir C. Napier put down the practice of suttee, which, however, was rare in Scinde, by a process entirely characteristic; for, judging the real cause of these immolations to be the profit derived by the priests, and hearing of an intended burning, he made it known that he would stop the sacrifice. The priests said it was a religious rite which must not be meddled with—that all nations had customs which should be respected, and this was a very sacred one. The general, affecting to be struck with the argument, replied: 'Be it so. This burning of widows is your custom: prepare the funeral pile. But my nation has also a custom: When men burn women alive, we hang them, and confiscate all their property. My

carpenters shall therefore erect gibbets on which to hang all concerned when the widow is consumed. Let us all act according to national customs!' No suttee took place then or afterwards.—*Sir C. Napier's Administration of Scinde.*

BY THESEA.

BY CALDER CAMPBELL.

WHEN tired of towns, and pining sore
For change to healthful ground,
Thou turn'st from crowds—still at the core
Feeling thy heart's worst wound—
When thou hast knocked at every door,
Yet no admittance found:
At every door where Pleasure in
Glides, with a sunny grace,
But which thine own bale barreth up
From thee—then seek a place
Where gates of stone and brass are none
To frown thee in the face!

The woods have walks, where thou mayst find
A balm to salve thy grief;
And in and out where waters wind,
Are sources of relief:
In which, if thou wilt bathe the mind,
Thou'lt have no comfort brief,
But peace—that falleth like the dew!
For everything that shews
God's sunshine speaketh marvels true
Of mercy and repose,
And joy, in rural scenes, beyond
All that the loud world knows!

Yet more, than wood or woodland rill
Can give of keen delight,
We glean from ocean-margins, till
The spirit—at the sight
Of all its range of changeful change—
Becometh, like it, bright!
Bright when the sunlight on it falls,
Or grave and grand when, dark,
The shadowy night lets down its pall
Upon each human ark;
And every surge seems but to urge
Extinction of life's spark!

A change, an always active change,
An everness of grace,
Of grace and grandeur, takes its range
Over the ocean's face:
As in a book for thoughts men look,
Thoughts in it we can trace!
A thought to turn us from ourselves
And all our petty cares—
A thought to move the spirit's love
To God, and God's affairs;
And thereby give to all that live
The sympathy that spares—

That spares our brother man from blame,
And pities him when o'er
His nature come such clouds of shame
As menaced us before:
God only can the sea-swell tame,
The mental peace restore!
Look on the ocean, then, and feel
Its turmoil and its calm
Arouse or tranquillise thy mind—
A stimulant or balm;
A thunder-tone to make thee think,
Or, gently soothing psalm!

TIME'S REVIEW OF CHARACTER.

ROBESPIERRE.

SOME characters are a puzzle to history, and none is more so than that of Robespierre. According to popular belief, this personage was a blood-thirsty monster, a vulgar tyrant, who committed the most unheard-of enormities, with the basely selfish object of raising himself to supreme power—of becoming the Cromwell of the Revolution. Considering that Robespierre was for five years—1789 to 1794—a prime leader in the political movements in France; that for a length of time he was personally concerned in sending a hundred and fifty heads to the scaffold per diem; and that the Reign of Terror ceased immediately on his overthrow—it is not surprising that his character is associated with all that is villainous and detestable. Nevertheless, as the obscurities of the great revolutionary drama clear up, a strange suspicion begins to be entertained, that the popular legend respecting Robespierre is in a considerable degree fallacious; nay, it is almost thought that this man was, in reality, a most kind-hearted, simple, unambitious, and well-disposed individual—a person who, to say the least of it, deeply deplored the horrors in which considerations of duty had unhappily involved him. To attempt an unravelment of these contradictions, let us call up the phantom of this mysterious personage, and subject him to review.

To understand Robespierre, it is necessary to understand the French Revolution. The proximate cause of that terrible convulsion was, as is well known, an utter disorder in all the functions of the state, and more particularly in the finances, equivalent to national bankruptcy. That matters might have been substantially patched up by judicious statesmanship, no one doubts; but that a catastrophe, sooner or later, was unavoidable, seems to be equally certain. The mind of France was rotten; the principles of society were undermined. As regards religion, there was a universal scepticism, of which the best literature of the day was the exponent; but this unbelief was greatly strengthened by the scandalous abuses in the ecclesiastical system. It required no depth of genius to point out that the great principles of brotherly love, humility, equality, liberty, promulgated as part and parcel of the Christian dispensation eighteen centuries previously, had no practical efficacy so far as France was concerned. Instead of equality before God and the law, the humbler classes were feudal serfs, without any appeal from the cruel oppressions to which they were exposed. In the midst of gloom, Rousseau's vague declamations on the rights of man fell like a ray of light. A spark was communicated, which kindled a

flame in the bosoms of the more thoughtful and enthusiastic. An astonishing impulse was almost at once given to investigation. The philosopher had his adherents all over France. Viewed as a species of prophet, he was, properly speaking, a madman, who in his ravings had glanced on the truth, but only glanced. Among men of sense, his ornate declamations concerning nature and reason would have excited little more attention than that which is usually given to poetic and speculative fancies.

Amidst an impulsive and lively people, unaccustomed to the practical consideration and treatment of abuses, there arose a cry to destroy, root up; to sweep away all preferences and privileges; to bring down the haughty, and raise the depressed; to let all men be free and equal, all men being brothers. Such is the origin of the three words—liberty, equality, and fraternity, which were caught up as the charter of social intercourse. It is for ever to be regretted that this explosion of sentiment was so utterly destructive in its character; for therein has it inflicted immense wrong on what is abstractedly true and beautiful. At first, as will be remembered, the revolutionists did not aim at establishing a republic, but that form of government necessarily grew out of their hallucinations. Without pausing to consider that a nation of emancipated serfs were unprepared to take on themselves the duties of an enlightened population, the plunge was unhesitatingly made.

At this comparatively distant day, even with all the aids of the recording press, we can form no adequate idea of the fervour with which this great social overthrow was set about and accomplished. The best minds in France were in a state of ecstasy, bordering on delirium. A vast future of human happiness seemed to dawn. Tyranny, force, fraud, all the bad passions, were to disappear under the beneficent approach of Reason. Among the enthusiasts who rushed into this marvellous frenzy, was Maximilian Robespierre. It is said by his biographers, that Robespierre was of English or Scotch origin: we have seen an account which traced him to a family in the north, of not a dissimilar name. His father, at all events, was an advocate at Arras, in French Flanders, and here Maximilian was born in 1759. Bred to the law, he was sent as a representative to the States-General in 1789, and from this moment he entered on his career, and Paris was his home. At his outset, he made no impression, and scarcely excited public notice. His manners were singularly reserved, and his habits austere. The man lived within himself. Brooding over the works of Rousseau, he indulged in the dream of renovating the moral world. Like Mohammed

contriving the dogmas of a new religion, Robespierre spent days in solitude, pondering on his destiny. To many of the revolutionary leaders, the struggle going on was merely a political drama, with a Convention for the *dénouement*. To Robespierre, it was a philosophical problem; all his thoughts aimed at the ideal—at the apotheosis of human nature.

Let us take a look at his personal appearance. Visionaries are usually slovens. They despise fashions, and imagine that dirtiness is an attribute of genius. To do the honourable member for Artois justice, he was above this affectation. Small and neat in person, he always appeared in public tastefully dressed, according to the fashion of the period—hair well combed back, frizzled, and powdered; copious frills at the breast and wrists; a stainless white waistcoat; light-blue coat, with metal buttons; the sash of a representative tied round his waist; light-coloured breeches, white stockings, and shoes with silver buckles. Such was his ordinary costume; and if we stick a rose in his button-hole, or place a nosegay in his hand, we shall have a tolerable idea of his whole equipment. It is said he sometimes appeared in top-boots, which is not improbable; for this kind of boot had become fashionable among the republicans, from a notion that as top-boots were worn by gentlemen in England, they were allied to constitutional government. Robespierre's features were sharp, and enlivened by bright and deeply-sunk blue eyes. There was usually a gravity and intense thoughtfulness in his countenance, which conveyed an idea of his being thoroughly in earnest. Yet, his address was not unpleasing. Unlike modern French politicians, his face was always smooth, with no vestige of beard or whiskers. Altogether, therefore, he may be said to have been a well-dressed, gentlemanly man, animated with proper self-respect, and having no wish to court vulgar applause by neglecting the decencies of polite society.

Before entering on his public career in Paris, Robespierre had probably formed his plans, in which, at least to outward appearance, there was an entire negation of self. A stern incorruptibility seemed the basis of his character; and it is quite true that no offers from the court, no overtures from associates, had power to tempt him. There was only one way by which he could sustain a high-souled independence, and that was the course adopted in like circumstances by Andrew Marvel—simple wants, rigorous economy, a disregard of fine company, an avoidance of expensive habits. Now, this is the curious thing in Robespierre's history. Perhaps there was a tinge of pride in his living a life of indigence; but in fairness it is entitled to be called an honest pride, when we consider that the means of profusion were within his reach. On his arrival in Paris, he procured a humble lodging in the Marais, a populous district in the north-eastern faubourgs; but it being represented to him some time afterwards, that, as a public man, it was unsafe to expose himself in a long walk daily to and from this obscure residence, he removed to a house in the Rue St Honoré, now marked No. 396, opposite the Church of the Assumption. Here he found a lodging with M. Duplay, a respectable but humble cabinet-maker, who had become attached to the principles of the Revolution; and here he was joined by his brother, who played an inferior part in public affairs, and is known in history as 'the Younger Robespierre.' The selection of this dwelling seems to have fallen in with Robespierre's notions of economy; and it suited his limited patrimony, which consisted of some rents irregularly paid by a few small farmers of his property in Artois. These ill-paid rents, with his salary as a representative, are said to have supported three persons—himself, his brother, and his sister; and so straitened was he in circumstances, that he had to borrow occasionally from his landlord. Even with all his pinching, he did not

make both ends meet. We have it on authority, that at his death he was owing L.160; a small debt to be incurred during a residence of five years in Paris, by a person who figured as a leader of parties; and the insignificance of this sum attests his remarkable self-denial.

Lamartine's account of the private life of Robespierre in the house of the Duplays is exceedingly fascinating, and we should suppose is founded on well-authorised facts. The house of Duplay, he says, 'was low, and in a court surrounded by sheds filled with timber and plants, and had almost a rustic appearance. It consisted of a parlour opening to the court, and communicating with a sitting-room that looked into a small garden. From the sitting-room a door led into a small study, in which was a piano. There was a winding-staircase to the first floor, where the master of the house lived, and thence to the apartment of Robespierre.'

Here, long acquaintance, a common table, and association for several years, 'converted the hospitality of Duplay into an attachment that became reciprocal. The family of his landlord became a second family to Robespierre, and while they adopted his opinions, they neither lost the simplicity of their manners nor neglected their religious observances. They consisted of a father, mother, a son yet a youth, and four daughters, the eldest of whom was twenty-five, and the youngest eighteen. Familiar with the father, filial with the mother, paternal with the son, tender and almost brotherly with the young girls, he inspired and felt in this small domestic circle all those sentiments that only an ardent soul inspires and feels by spreading abroad its sympathies. Love also attached his heart, where toil, poverty, and retirement had fixed his life. Eléonore Duplay, the eldest daughter of his host, inspired Robespierre with a more serious attachment than her sisters. The feeling, rather predilection than passion, was more reasonable on the part of Robespierre, more ardent and simple on the part of the young girl. This affection afforded him tenderness without torment, happiness without excitement: it was the love adapted for a man plunged all day in the agitation of public life—a repose of the heart after mental fatigue. He and Eléonore lived in the same house as a betrothed couple, not as lovers. Robespierre had demanded the young girl's hand from her parents, and they had promised it to him.

"The total want of fortune," he said, "and the uncertainty of the morrow, prevented him from marrying her until the destiny of France was determined; but he only awaited the moment when the Revolution should be concluded, in order to retire from the turmoil and strife, marry her whom he loved, go to reside with her in Artois, on one of the farms he had saved among the possessions of his family, and there to mingle his obscure happiness in the common lot of his family."

'The vicissitudes of the fortune, influence, and popularity of Robespierre effected no change in his simple mode of living. The multitude came to implore favour or life at the door of his house, yet nothing found its way within. The private lodging of Robespierre consisted of a low chamber, constructed in the form of a garret, above some cart-sheds, with the window opening upon the roof. It afforded no other prospect than the interior of a small court, resembling a wood-store, where the sounds of the workmen's hammers and saws constantly resounded, and which was continually traversed by Madame Duplay and her daughters, who there performed all their household duties. This chamber was also separated from that of the landlord by a small room common to the family and himself. On the other side were two rooms, likewise attics, which were inhabited, one by the son of the master of the house, the other by Simon Duplay, Robespierre's secretary, and the nephew of his host.

'The chamber of the deputy contained only a wooden bedstead, covered with blue damask ornamented with white flowers, a table, and four straw-bottomed chairs. This apartment served him at once for a study and dormitory. His papers, his reports, the manuscripts of his discourses, written by himself in a regular but laboured hand, and with many marks of erasure, were placed carefully on deal-shelves against the wall. A few chosen books were also ranged thereon. A volume of Jean Jacques Rousseau or of Racine was generally open upon his table, and attested his philosophical and literary predilections.'

With a mind continually on the stretch, and concerned less or more in all the great movements of the day, the features of this remarkable personage 'relaxed into absolute gaiety when in-doors, at table, or in the evening, around the wood-fire in the humble chamber of the cabinet-maker. His evenings were all passed with the family, in talking over the feelings of the day, the plans of the morrow, the conspiracies of the aristocrats, the dangers of the patriots, and the prospects of public felicity after the triumph of the Revolution. Sometimes Robespierre, who was anxious to cultivate the mind of his betrothed, read to the family aloud, and generally from the tragedies of Racine. He seldom went out in the evening; but two or three times a year he escorted Madame Duplay and her daughter to the theatre. On other days, Robespierre retired early to his chamber, lay down, and rose again at night to work. The innumerable discourses he had delivered in the two national assemblies, and to the Jacobins; the articles written for his journal while he had one; the still more numerous manuscripts of speeches which he had prepared, but never delivered; the studied style so remarkable; the indefatigable corrections marked with his pen upon the manuscripts—attest his watchings and his determination.

'His only relaxations were solitary walks in imitation of his model, Jean Jacques Rousseau. His sole companion in these perambulations was his great dog, which slept at his chamber-door, and always followed him when he went out. This colossal animal, well known in the district, was called Brout. Robespierre was much attached to him, and constantly played with him. Occasionally, on a Sunday, all the family left Paris with Robespierre; and the politician, once more the man, amused himself with the mother, the sisters, and the brother of Eléonore in the wood of Versailles or of Issy.' Strange contradiction! The man who is thus described as so amiable, so gentle, so satisfied with the humble pleasures of an obscure family circle, went forth daily on a self-imposed mission of turbulence and terror. Let us follow him to the scene of his avocations. Living in the Rue St Honoré, he might be seen every morning on his way, by one of the narrow streets which led to the rooms of the National Assembly, or Convention, as the legislative body was called after the deposition of Louis XVI. The house so occupied, was situated on a spot now covered by the Rue Rivoli, opposite the gardens of the Tuileries. In connection with it, were several apartments used by committees; and there, by the leading members of the House, the actual business of the nation was for a long time conducted. It was by the part he played in one of these formidable committees, that of 'Public Safety'—more properly, public insecurity—that he becomes chargeable with his manifold crimes. For the commission of these atrocities, however, he held himself to be entirely excused; and how he could possibly entertain any such notion, remains for us to notice.

The action of the Revolution was in the hands of three parties, into which the Convention was divided—namely, the Montagnards, the Girondists, and the *Fédérés*. The last mentioned were a comparatively harmless set of persons, who acted as a neutral body,

and leaned one way or the other according to their convictions, but whose votes it was important to obtain. Between the Montagnards and the Girondists there was no distinct difference of principle—both were keen republicans and levellers; but in carrying out their views, the Montagnards were the most violent and unscrupulous. The Girondists expected that, after a little preliminary harshness, the Republic would be established in a pacific manner; by the force, it may be called, of philosophic conviction spreading through society. They were thus the moderates; yet their moderation was unfortunately ill manifested. At the outset, they countenanced the disgraceful mobbings of the royal family; they gloried in the horrors of the 10th of August, and the humiliation of the king; and only began to express fears that things were going too far, when massacre became the order of the day, and the guillotine assumed the character of a national institution. They were finally borne down, as is well known, by the superior energy and audacity of their opponents; and all perished one way or other in the bloody struggle. Few pity them.

We need hardly recall the fact, that the discussions in the Convention were greatly influenced by tumultuary movements out of doors. At a short distance, were two political clubs, the Jacobins and the Cordeliers, and there everything was debated and determined on. Of these notorious clubs, the most uncompromising was the Jacobins; consequently, its principal members were to be found among the party of the Montagnards. During the hottest time of the Revolution, the three men most distinguished as Montagnards and Jacobins were Marat, Danton, and Robespierre. Mirabeau, the orator of the Revolution, had already disappeared, being so fortunate as to die naturally, before the practice of mutual guillotining was established. After him, Vergniaud, the leader of the Girondists, was perhaps the most effective speaker; and till his fall, he possessed a commanding influence in the Convention. Danton was likewise a speaker of vast power, and from his towering figure, he seemed like a giant among pigmies. Marat might be termed the representative of the kennel. He was a low demagogue, flaunting in rags, dirty, and venomous: he was always calling out for more blood, as if the grand desideratum was the annihilation of mankind. Among the extreme men, Robespierre, by his eloquence, his artifice, and his bold counsels, contrived to maintain his position. This was no easy matter, for it was necessary to remain firm and unfaltering in every emergency. He, like the others at the helm of affairs, was constantly impelled forward by the clubs, but more so by the incessant clamours of the mob. At the Hôtel de Ville sat the Commune, a crew of blood-thirsty villains, headed by Hebert; and this miscreant, with his armed sections, accompanied by paid female furies, beset the Convention, and carried measures of severity by sheer intimidation. Let it further be remembered that, in 1793, France was kept in apprehension of invasion by the Allies under the Duke of Brunswick, and the army of emigrant noblesse under the command of Condé. The hovering of these forces on the frontiers, and their occasional successes, produced a constant alarm of counter-revolution, which was believed to be instigated by secret intriguers in the very heart of the Convention. It was alleged by Robespierre in his greatest orations, that the safety of the Republic depended on keeping up a wholesome state of terror; and that all who, in the slightest degree, leaned towards clemency, sanctioned the work of intriguers, and ought, accordingly, to be proscribed. By such harangues—in the main, miserable sophistry—he acquired prodigious popularity, and was in fact irresistible.

Thus was legalised the Reign of Terror, which, founded in false reasoning and insane fears, we must, nevertheless, look back upon as a thing, at least to a

certain extent, reconcilable with a sense of duty; inasmuch as even while signing warrants for transferring hundreds of people to the Revolutionary Tribunal—which was equivalent to sending them to the scaffold—Robespierre imagined that he was acting throughout under a clear, an imperious necessity: only ridding society of the elements that disturbed its purity and tranquillity. Stupendous hallucination! And did this fanatic really feel no pang of conscience? That will afterwards engage our consideration. Frequently, he was called on to proscribe and execute his most intimate friends; but it does not appear that any personal consideration ever stayed his proceedings. First, he swept away Royalists and aristocrats; next, he sacrificed the Girondists; last, he came to his companion-Jacobins. Accusing Danton and his friends of a tendency to moderation, he had the dexterity to get them proscribed and beheaded. When Danton was seized, he could hardly credit his senses: he who had long felt himself sure of being one day dictator by public acclamation, and to have been deceived by that dreamer, Robespierre, was most humiliating. But Robespierre would not dare to put him to death! Grave miscalculation! He was immolated like the rest; the crowd looking on with indifference. Along with him perished Camille Desmoulins, a young man of letters, and a Jacobin, but convicted of advocating clemency. Robespierre was one of Camille's private and most valued friends; he had been his instructor in politics, and had become one of the trustees under his marriage-settlement. Robespierre visited at the house of his *protégé*; chatted with the young and handsome Madame Desmoulins at her parties; and frequently dandled the little Horace Desmoulins on his knee, and let him play with his bunch of seals. Yet, because they were adherents of Danton, he sent husband and wife to the scaffold within a few weeks of each other! What eloquent and touching appeals were made to old recollections by the mother of Madame Desmoulins. Robespierre was reminded of little Horace, and of his duty as a family guardian. All would not do. His heart was marble; and so the wretched pair were guillotined. Camille's letter to his wife, the night before he was led to the scaffold, cannot be read without emotion. He died with a lock of her hair clasped convulsively in his hand.

Having thus cleared away to some extent all those who stood in the way of his views, Robespierre bethought himself of acting a new part in public affairs, calculated, as he thought, to dignify the Republic. Chaumette, a mean confederate of Hebert, and a mouth-piece of the rabble, had, by consent of the Convention, established Paganism, or the worship of Reason, as the national religion. Robespierre never gave his approval to this outrage, and took the earliest opportunity of restoring the worship of the Supreme. It is said, that of all the missions with which he believed himself to be charged, the highest, the holiest in his eyes, was the regeneration of the religious sentiment of the people: to unite heaven and earth by this bond of a faith which the Republic had broken, was for him the end, the consummation of the Revolution. In one of his paroxysms, he delivered an address to the Convention, which induced them to pass a law, acknowledging the existence of God, and ordaining a public festival to inaugurate the new religion. This fête took place on the 8th of June 1794. Robespierre headed the procession to the Champ de Mars; and he seemed on the occasion to have at length reached the grand realisation of all his hopes and desires. From this *coup de théâtre* he returned home, magnified in the estimation of the people, but ruined in the eyes of the Convention. His conduct had been too much that of one whose next step was to the restoration of the throne, with himself as its occupant. By Fouché, Tallien, Collot-d'Herbois, and some others, he was now thwarted in all his schemes. His wish was to close the Reign of Terror and allow the new

moral world to begin; for his late access of devotional feeling had, in reality, disposed him to adopt benign and clement measures. But to arrest carnage was now beyond his power; he had invoked a demon which would not be laid. Assailed by calumny, he made the Convention resound with his speeches; spoke of fresh proscriptions to put down intrigue; and spread universal alarm among the members. In spite of the most magniloquent orations, he saw that his power was nearly gone. Sick at heart, he began to absent himself from committees, which still continued to send to the scaffold numbers whose obscure rank should have saved them from suspicion or vengeance.

At this juncture, Robespierre was earnestly entreated by one of his more resolute adherents, St Just, to play a bold game for the dictatorship, which he represented as the only means of saving the Republic from anarchy. Anonymous letters to the same effect also poured in upon him; and prognostics of his greatness, uttered by an obscure fortune-teller, were listened to by the great demagogue with something like superstitious respect. But for this personal elevation he was not prepared. Pacing up and down his apartment, and striking his forehead with his hand, he candidly acknowledged that he was not made for power; while the bare idea of doing anything to endanger the Republic amounted, in his mind, to a species of sacrilege. At this crisis in his fate, therefore, he temporised: he sought peace, if not consolation, in solitude. He took long walks in the woods, where he spent hours seated on the ground, or leaning against a tree, his face buried in his hands, or earnestly bent on the surrounding natural objects. What was the precise tenor of his meditations, it would be deeply interesting to know. Did the great promoter of the Revolution ponder on the failure of his aspirations after a state of human perfectibility? Was he torn by remorse on seeing rise up, in imagination, the thousands of innocent individuals whom, in vindication of a theory, he had consigned to an ignominious and violent death, yet whose removal had, politically speaking, proved altogether fruitless?

It is the more general belief, that in these solitary rambles Robespierre was preparing an oration, which, as he thought, should silence all his enemies, and restore him to parliamentary favour. A month was devoted to this rhetorical effort; and, unknown to him, during that interval all parties coalesced, and adopted the resolution to treat his oration when it came with contempt, and, at all hazards, to have him proscribed. The great day came, July 26 (8th Thermidor), 1794. His speech, which he read from a paper, was delivered in his best style—in vain. It was received with yells and hootings; and, with dismay, he retired to the Jacobins, to deliver it over again—as if to seek support among a more subservient audience. Next day, on entering the Convention, he was openly accused by Tallien and Billaud-Varennes of aspiring to despotic power. A scene of tumult ensued, and amid cries of *Down with the tyrant!* a writ for his committal to prison was drawn out. It must be considered a fine trait in the character of Robespierre the younger, that he begged to be included in the same decree of proscription with his brother. This wish was readily granted; and St Just, Couthon (who had lost the use of his legs, and was always carried about in an arm-chair), and Le Bas, were added to the number of the proscribed. Rescued, however, from the gendarmes by an insurrectionary force, headed by Barras, Robespierre and his colleagues were conducted in triumph to the Hôtel de Ville. Here, during the night, earnest consultations were held; and the adherents of Robespierre implored him in desperation, as the last chance of safety for them all, to address a rousing proclamation to the sections. At length, yielding unwillingly to these frantic appeals, he commenced writing the required address; and it was while subscribing his name to this seditious document.

that the soldiers of the Convention burst in upon him, and he was shot through the jaw by one of the gendarmes. At the same moment, Le Bas shot himself through the heart. All were made prisoners, and carried off—the dead body of Le Bas not excepted.

While residing for a short time in Paris in 1849, we were one day conducted by a friend to a large house, with an air of faded grandeur, in the eastern faubourgs, which had belonged to an aged republican, recently deceased. He wished me to examine a literary curiosity, which was to be seen among other relics of the great Revolution. The curiosity in question was the proclamation, in the handwriting of Robespierre, to which he was in the act of inscribing his signature, when assaulted and made prisoner in the Hôtel de Ville. It was a small piece of paper, contained in a glass-frame; and, at this distance of time, could not fail to excite an interest in visitors. The few lines of writing, commencing with the stirring words: '*Courage, mes compatriotes!*' ended with only a part of the subscription. The letters, *Robes*, were all that were appended, and were followed by a blur of the pen; while the lower part of the paper shewed certain discolourations, as if made by drops of blood. And so this was the last surviving token of the notorious Robespierre! It is somewhat curious, that no historian seems to be aware of its existence.

Stretched on a table in one of the anterooms of the Convention; his head leaning against a chair; his fractured jaw supported by a handkerchief passed round the top of his head; a glass with vinegar and a sponge at his side to moisten his feverish lips; speechless and almost motionless, yet conscious!—there lay Robespierre—the clerks, who, a few days ago, had cringed before him, now amusing themselves by pricking him with their penknives, and coarsely jesting over his fall. Great crowds, likewise, flocked to see him while in this undignified posture, and he was overwhelmed with the vilest expressions of hatred and abuse. The mental agony which he must have experienced during this humiliating exhibition, could scarcely fail to be increased on hearing himself made the object of unsparing and boisterous declamations from the adjoining tribune.

At three o'clock in the afternoon (July 28), the prisoners were placed before the Revolutionary Tribunal, and at six, the whole were tied in carts, the dead body of Le Bas included, and conducted to execution. To this wretched band were added the whole family of the Duplays, with the exception of the mother; she having been strangled the previous night by female furies, who had broken into her house, and hung her to the iron rods of her bedstead. They were guiltless of any political crime; but their private connection with the principal object of proscription was considered to be sufficient for their condemnation. The circumstance of these individuals being involved in his fate, could not fail to aggravate the bitterness of Robespierre's reflections. As the dismal cortege wended its way along the Rue St Honoré, he was loaded with imprecations by women whose husbands he had destroyed, and the shouts of children, whom he had deprived of parents, were the last sounds heard by him on earth. Yet he betrayed not the slightest emotion—perhaps he only pitied the ignorance of his persecutors. In the midst of the feelings of a misunderstood and martyred man, his head dropped into the basket!

These few facts and observations respecting the career of Robespierre, enable us to form a tolerably correct estimate of his character. The man was a bigot. A perfect Republic was his faith, his religion. To integrity, perseverance, and extraordinary self-denial under temptation, he united only a sanguine temperament and moderate abilities for the working-out of a mistaken principle. Honest and zealous in his purpose, his

conduct was precisely analogous to that of all religious persecutors—sparing no pain or bloodshed to accomplish what he believed to be a good end. Let us grant that he was a monomaniac, the question remains as to his general accountability. If he is to be acquitted on the score of insanity, who is to be judged? Not so are we to exempt great criminals from punishment and obloquy. Robespierre knew thoroughly what he was about; and far as he was misled in his motives, he must be held responsible for his actions. Before entering on the desperate enterprise of demolishing all existing institutions, with the hope of reconstructing the social fabric, it was his duty to be assured that his aims were practicable, and that he was himself authorised to think and act for the whole of mankind, or specially commissioned to kill and terrify into his doctrines. Instead of this, there is nothing to shew that he had formed any distinct scheme of a government to take the place of that which he had aided in destroying. All we learn is, that there hovered in his mind's eye some vague Utopia, in which public affairs would go on very much of themselves, through the mere force of universal Benevolence, liberated from the bosom of Nature. For his folly and audacity in nourishing so wild a theory, and still more for the reckless butcheries by which he sought to bring it into operation, we must, on a review of his whole character, adhere to the popular belief on the subject. Acquitted, as he must necessarily be, of the charge of personal ambition, he was still a monster, only the more dangerous and detestable for justifying murder on the ground of principle.

W. C.

INFANT SCHOOLS IN HUNGARY.

THE Austrian government has for some years been exerting itself, in connection with the clergy, for the improvement and spread of education in all the provinces of the empire, being anxious to do all in their power to save the country from those excesses which are so often found in connection with ignorance. As an Englishman, living in friendly intercourse with members of the imperial family, and many persons high in the administration, I am happy to avow my thorough conviction, that such, pure and simple, is the object held in view in the establishment of schools throughout the empire, and above all, in that of the infant schools, which are now planted in every place where there exists a sufficiency of population. I have all along taken a deep interest in these little seminaries in the kingdoms of Bohemia and Hungary, and am highly sensible of the liberal and humane principles on which they are conducted.

Each contains from two to three hundred children, between one and a half and five years of age, all of them being the offspring of the humbler classes, and many of them orphans. All are instructed in the same room, but classed apart; that is, the girls occupy one half of the apartment, and the boys the other, leaving an avenue between them, which is occupied by the instructors. The boys are under the superintendence of a master, and the girls under that of a mistress. Both, however, teach or attend to the various necessities of either, as circumstances may require. Infants too young to learn, and those who are sent, either because they are orphans, or because the extreme poverty of the mother obliges her to do outwork, are amused with toys and pictures, all, however, of an instructive nature, and which the elder children delight to exhibit and explain to them in their own quaint little ways. I have frequently seen an infant, scarcely able to walk, brought in for the first time, and left on one of the benches of the school-room, surrounded by those already initiated. The alarm its new position occasioned to the little creature, at thus suddenly finding itself abandoned by the only person with whom it was familiar, in the midst of a multitude of unknown

faces, can easily be imagined. A flood of tears was the first vent to its feelings, accompanied by a petulant endeavour to follow its parent or nurse. It was immediately, however, surrounded by a score of little comforters, who, full of the remembrance of past days, when their fears and their sadness were in like manner soothed and dissipated, would use a thousand little arts of consolation—one presenting a toy or picture, another repeating what has almost become a formula of kindly re-assurance, till smiles and sunshine would succeed to tears and clouds upon that little brow, and confidence and content to fear and mistrust. I have often seen the day thus pass with neophytes as a dream, only to be broken when the parent or nurse, returning to take them home, found them in the centre of a little joyous group, the gayest of the gay!

One, after all, cannot wonder at this change, when he contrasts the scenery of the interior of an infant school with that of the generality of poor homes. The child, making, as it were, its first voyage in life, has here been introduced, not merely to a society conducted on principles of gentleness and kindness, but to a fairy-land of marvels for the fascination of its intellectual faculties. From the ceiling to the *dado*—the wainscotted space at the base, for in Hungary this old arrangement is still maintained in its fullest form—the walls are covered with pictures of scripture scenes and objects in natural history; while the *dado* itself, terminating above in a shelf, exhibits busts, stuffed animals, and pots of flowers—the whole place, indeed, being a kind of museum, specially adapted for the enjoyment as well as instruction of the young. At first, filled with wonder and delight, the infant begins to study the meaning and character of these objects: after a short attendance, you find they can tell the names of many, and speak many things regarding them. One day, while attending a Bohemian infant school, which was dismissing, and as I was examining some of the birds upon the shelf, a little hand was insinuated into mine, as if to get it warmed—as is often done by children—when, looking down, I beheld a bright, intelligent face, apparently eager to make some communication. ‘Tuzok, tuzok!’ (‘Bustard, bustard!’) said a little voice. Encouraged by my smile, there was immediately added: ‘*Ex tuzok, ez mazzar honban, tiszta fétöl jönn;*’ (‘That is a bustard from Hungary, from the river Teiss.’) Another little one, attracted by this observation, pointed to the elephant, and said in German: ‘*Und der ist elefant: er kommt von weiten, von ausland—von morgenland!*’ (‘And that is the elephant: it comes from far, from a foreign land—from the morning-land!’)—that is, the East!

The children learn the first rudiments of religion, duty and obedience to their parents and teachers, spelling, &c. After the expiration of the time allotted to them here, they are sent to the normal schools, where they are instructed in all the various branches of education which are necessary to fit them for any situation or profession for which their several talents seem to have destined them.

All parents of the lower classes are *compelled* by law to send their children to school at a certain age. If they are in easy circumstances, they contribute a small sum monthly towards the expenses of the establishment. Those who are unable to pay the full sum, pay the half or a part; others, again, such as a great portion of day-labourers with large families, and who cannot even supply their children with necessary food and clothing, pay *nothing*: it is merely necessary for these to be furnished with a certificate of their incapacity to pay for the education of their children, and the state takes the whole charge of their instruction on itself.

We have already spoken of the deep interest we have taken in the progress of the infant schools. We visit them frequently, and attend all the examinations. On entering, it is scarcely possible to recognise in clean,

orderly inmates, the dirty, ragged, quarrelling, scratching, screaming children of the back-streets, which, however, they were only a short time ago. All is changed: the miserable hut, the narrow street, and muddy lane, for a pretty room full of pleasant objects; the timid look and distrustful scowl, for sunny cheerfulness and open confidence. There is no unkind distinction among the lower classes in this country, and by this I mean the whole of the Austrian states. There being only two classes—the nobles and the commons—none of the commons despise each other, however poor or humble their situation may be. The barefooted orphan, kept and educated by charity or the state, is not an object of contempt or ridicule to the child of the prosperous artisan, who stands clothed in its little snow-white frock and pink ribbons beside its less fortunate companion. Neither is any distinction made on account of religion. The infant schools of the empire are for the children of all the poor—Catholic, Lutheran, evangelical, &c.; and the two belonging to Presburg, to which we here particularly allude, contain from sixty to seventy of the latter in every two hundred.

I was present at an examination of one of our Presburg seminaries in September last. A number of girls and boys, from three to five years of age, with a very few a little older, who had come in comparatively late, were subjected to the usual questioning in the various branches of their very elementary erudition. Some of the queries proved beyond the powers of the generality of the children; but this led to no expression of dejection or awkwardness. They evidently all endeavoured to do their very best. It was interesting to observe, that so far from pining to see a cleverer neighbour answer what they had failed in, they seemed to feel a triumph when, after a general difficulty, it was at length found that *some one* could give the right answer—showing that they might have a feeling of emulation as to the honour of the school, but none as between one pupil and another. On several occasions, when some unusually intelligent little creature would come from a back-form, and solve a question which had bewildered those in front, there was a sensible expression of delight over the whole school.

In a far-off corner sat a little boy, poorly dressed, and of pallid countenance, but with a keen and intelligent eye, which had attracted my notice from the beginning. The more difficult the questions grew, his eye was fixed with the keener gaze on the face of the master. Several times I observed a puzzled child cast backwards to him a look, as expressing the assurance that *he* was able to solve all difficulties. At length, on a slight motion of the master's hand, the little brown boy was seen to dart from his obscure recess, and pass rapidly across the forms, while his companions eagerly made way for him, clapping their hands as in anticipation of some brilliant achievement. In an instant, the boy stood before the master, his dark eye full of anxious expression, but quite devoid of doubt or anxiety. All our attention was at once directed to the half-clothed, barefooted child, to whom the questions were now put, and by whom they were answered with a promptitude and precision most wonderful. And who, what was he, that little brown boy? Some did not care to ask, and others said: ‘Who would have thought that that little beggar-boy would have been so smart!’ But God has chosen the vile things (to man) of this earth to become a bright and shining light to the world. We asked who that little boy was, and the master smiled, shook his head, and said: ‘Oh, I scarcely know myself: it is a little boy the police have sent us in lately from the streets. It is not above three weeks since he came, but he is a good and very clever child—very desirous to learn, and never forgets anything!’

I was affected by this trivial circumstance, reflecting how many little brown boys like this there must be in

various countries called civilised, who, for want of a refuge where love and light are predominant, remain the outcasts of the streets, and become the prey of vice and ignorance.

THE LOSING GAME.

[The following story is by no means a piece of mere invention. The principal points were narrated to me by a very intelligent young North-Sea fisherman, who had frequently heard the legend from a grizzled old sailor on board the smack in which he was an apprentice. The veteran used to tell the story as having happened to himself; and he had told it so often, that he firmly believed it, and used to get into a passion when any of the crew dared to doubt or laugh. I have, of course, licked the rough outlines of the story or anecdotes into something like shape; but the main incidents are repeated to this day by the sailors of the 'Barking Fleet,' as the squadron of handsome smacks are called, which, hailing from the town of Barking, in Essex, pursue the toilsome task, in all seasons, and almost in all weathers, of supplying the London market with North-Sea turbot, soles, and cod. The story is told in the first person, as Dick Hatch himself might have narrated it.]

Nine forty years ago, mates, when I was as young and supple as the boy Bill, there—though I was older than him by some years—I was serving my apprenticeship to the trade aboard the sloop *Lively Nan*. There were not such big vessels in the trade then, mates, as now; but they were tight craft, and manned by light fellows; and they did their work as well as the primest clipper of the Barking Fleet. Well, the *Lively Nan* was about the quickest and most weatherly of the whole fleet; and she had a great name for making the quickest runs between the fishing-grounds and the river. But it wasn't owing so much to the qualities of the smack, as to the seamanship of the skipper. A prime sailor he was, surely. There wasn't another man sailed out of the River Thames who could handle a smack like Bob Goss. When he took the tiller, somehow the craft seemed to know it, and bobbed up half a point nearer to the wind; and when we were running free with the main-sheet eased off, and the foresail shivering, her wake would be as straight as her mast; only, he was a rare fellow for carrying on, was old Captain Goss! We would be staggering under a whole main-sail, when the other smacks had three reefs in theirs; and it was odds but we had one line of reef-points triced up; our neighbours would be going at it under storm-trysail and storm-jib. He worked the *Lively Nan* hard, he did, old Captain Goss. Sweet, and wholesome, and easy as she was—for she would rise to any sea, like as comfortable as a duck—Old Goss all but drove her under. Dry jackets were scarce on board the *Lively Nan*. If there was as much wind stirring as would whirl round the rusty old vane on the topmast head, 'Carry on, carry on!' was always the captain's cry; and away we would bowl, half-a-dozen of the lee-streaks of the deck under water.

Well, mates, Old Goss was a prime sailor; but he was a strange sort of man. To see him in a passion, was something you wouldn't forget in a hurry; and you wouldn't have known him long without having the chance. Most of us can swear a bit now and then; but you ought to have heard Captain Goss! He used even to frighten the old salts, that had common oaths in their mouths from morning till night. He was worse than the worst madman in Bedlam when his blood was up; and even the strong, bold men of the crew used to cower before him like as the cabin-boy. And yet, mates, he was but a little, maimed man, and more than sixty years old. He had a regular monkey-face; I never saw one like it—brown, and all over puckers, and working and twitching, like the sea where the tide-currents meet. He had but one eye, and he wore a big black patch over the place where the other had been; but that one eye, mates, would screw into you like a gimlet. Well, Captain Goss was more than fifty when he came down to

Barking, and bought the *Lively Nan*, and made a carrier* of her; and nobody knew who he was, or where he came from. There was an old house at Barking then, and I have heard say that its ruins are there yet. The boys said that Guy Fawkes—him they burn every 5th of November—used to live there; and the story went that it was haunted, and that there was one room, the door of which always stood ajar, and nobody could either open or shut it. Well, mates, Old Captain Goss wasn't the sort of man to care much about Guy Fawkes or goblins; so he hires a room in this old house—precious cheap he got it!—and when he was ashore, you could see a light in it all night; and if you went near, you might listen to Old Goss singing roaring songs about the brisk boys of the Spanish main, and yelling and huzzaing to himself, and drinking what he called his five-water grog. Five-water grog, mates—that was one of his jokes. It was rum made hot on the fire; and he could drink it scalding and never wink: and he would drink it till he got reg'lar wild. He was never right-down drunk, but just wild, like a savage beast! And then he would jump up, and make-believe he was fighting, and holler out to give it to the Spanish dogs, and that there were lots of doubloons below. I've gone myself with other youngsters, to listen at the door; and once when he was in the fit, yelling and singing, and laughing and swearing, all at once, I'm jiggered if he didn't out with a brace of old brass-mounted ship's pistols, and fire them right and left in the air, so that we cut and run a deal faster than we came. Of course the report soon got about that Captain Goss was an old pirate, or at the best an old buccaneer; and the Barking folks used to tell how many crews he had made walk the plank, and how there was blood-marks on his hands, which he used to try to cover with tar. But no one dared to say a word of this to him; and as he was a prime sailor, and even kind after his fashion, when he had taken first a reg'lar quantity of his five-water grog, he never wanted hands. At sea, he was often wild enough with liquor; but he no sooner put his hand on the tiller, than he seemed all right: and the *Lively Nan* walked through it like smoke. I'm jiggered, mates, if that old fellow couldn't sail a ship asleep or awake, drunk or sober, dead or alive.

Well, then, such was my old captain, Bobby Goss; and now I'll tell you what happened to him. One evening, in the autumn-time, and just when we were beginning to look out for the equinoctials, the *Lively Nan* was lying with her anchor a-peak—for we didn't mean to stay long—in Yarmouth Roads. There were three men on board, and one boy with myself; they called him Lawrence. I forget his other name, for I aint seen him for many a year. Well, the men had all turned in for'ards, and we two were left to wait for the captain, who had gone ashore; and after he came back, to take our spells at an anchor-watch till daylight, when we were to trip, and be off to the Dogger. The weather was near a dead calm, and warm for the time of year. The *Lively Nan* was lying with her gaff hoisted half-way and the peak settled down, so that we mightn't lose any time in setting the sail in the morning; and Lawrence and I were lying in the fore-castle, with our pipes in our mouths, watching the shore, to see if the captain was coming off, and seeing the sun go down over the sand-hills and the steeples and the wind-mills of Yarmouth. There weren't many vessels in the Roads; but the Yarmouth galleys, that go dodging about among the sands, were stretching in for the beach with the last puff of the evening breeze; and the herring-boats could be seen going off to their ground like specks out upon the sea. Then presently it got dark, and the town-lights of Yarmouth came sparkling out, the harbour-light the biggest, and away to the

* The smacks used to convey the fish from the trawlers to the Thames are called 'carriers.'

south'ard, the Lowstoft Light-house. But, after all, there aint much amusement in watching lights, and we both of us wanted to turn in; but till the captain came, there was no warm blankets for either. So we got wondering what Old Goss was doing at Yarmouth, and what was keeping him, and whether he'd come aboard drunk or sober, and whether he'd blow us up, and whether he'd rope's-end us, which was as likely as not, or perhaps more. Well, so hour after hour passed, and the night was so calm we could hear the chimes of the Yarmouth clocks, and the water going lap-lap against the sides of the *Lively Nan*, and the rudder going cheep-cheep as the sway of the sea stirred it. At last, says Lawrence: 'It's reg'lar dull here; let's go below.'

'What's the use?' says I: 'there's no light, and the hands are all fast asleep.'

'No,' says he; 'to the captain's cabin I mean. There's a lamp there; and we can hear the oars of the boat, and be on deck again, and no one the wiser.'

Well, mates, I had some curiosity to get a glimpse of the captain's cabin, where I very seldom went, and never stayed long: so down we went, lighted up the lamp, and looked about us. There wasn't much, however, to see. It was a black little hole, with a brass stove and lockers, and a couple of berths, larboard and starboard, and a small picture of a fore-and-aft rigged schooner, very low in the water, and looking a reg'lar clipper; and no name to her. Well, mates, all at once I caught sight of a pack of cards lying on a locker. 'Here's a bit o' fun,' says I; 'Lawry, let's have a game;' and he agreed. So down we sat, and began to play 'put.' A precious greasy old lot of cards they were; and so many dirt-spots on them, that it required a fellow with sharp eyes to make out the dirt from the Clubs and Spades. However, we got on somehow. When one was ready to play, he knocked the table with his knuckles, as a signal to the other; and for hours and hours we shuffled and dealt and knocked until it was late in the night, which I ought to have told you was Saturday night. At last, just as we ended a game, and when we were listening if a boat was coming, before beginning another, we heard the Yarmouth clocks ring twelve.

'Put up the cards,' says Lawrence; 'I'll not play more.'

'Why not?' says I.

'Because,' says he, and he stammered a little—'because it's Sunday.'

Well, mates, I had forgotten all my notions of that kind, and so I laughed at him. But it was no use.

'Them,' says he, 'that plays cards on a Sunday, runs a double chance of death on Monday.'

His mother had told him this, and so he refused out-and-out to go on. 'Well,' says I, 'I aint afraid, and I'd play if I had a partner.'

Mates! the cards were lying in a pack, and the words were hardly out of my mouth, before they slipped down, and spread themselves out upon the table! Lawrence gave a loud screech, and jumped up. 'Oh!' says he, 'it's the Old Un with us in the cabin!' and up the companion he tumbled, and I at his heels; and rushed for'ard as hard as we could pelt, and cuddled under the foresail—which was lying on the deck—all trembling and shaking, and our teeth chattering.

'I told you what it would be,' says Lawrence.

'I'll never play cards again,' says I, 'on a Sunday!'

Just at that minute we heard oars, and then a hail: 'The *Lively Nan*, ahoy!' It was Old Goss's voice, and it was so thick, we knew he wasn't sober. So we slunk out, all trembling and clinging to each other. The lamp was burning up the cabin skylight, but we were afraid to look down. But if we didn't look, we could not help hearing; and sure enough there was the rap of knuckles on the table, as if Somebody was impatient

that his partner didn't play. Well, we were more dead than alive when the captain came alongside in a shore-boat, and tumbled up the side, abusing the boatmen for the price he had to pay them. He had a lantern, and noticed the state we were in at once.

'Now, then,' says he, 'you couple of young swabs, what are ye standing grinning there for, like powder-monkeys in the aguer? What's come over you, ye twin pair of snivelling Molly Coddles?' We looked at each other, but we were afraid to speak. 'What is it?' he roared again, 'or I'll make your backs as hot as a roasted pig's!' And on this, Lawrence reg'larly blubbered out: 'The devil, sir; the devil is in the cabin playing at double dummy "put"!''

You should have heard Old Goss's laugh at this. They might have heard it ashore at Yarmouth. Just as it stopped, the sound of the knuckles came up through the skylight.

'Who's below?' says the captain.

'No one,' says I.

'But Davy Jones,' says Lawrence.

'Then,' says the captain, with an oath that was enough to split the mast, 'I'll play with him! It's not been the first time, and it mayn't be the last. Go for'ard, you beggars' brats, and don't disturb us;' and he went down the companion.

But we did not go for'ard. No; we stretched ourselves on the deck, and peeped down the skylight. We could only see faintly, but we did see the captain sitting, holding his hand of cards, and another hand opposite, all spread out, but no fingers holding it, and no man behind it. There was a rap on the table, and I am sure it was not the captain that struck it.

'Very well,' says he; 'wait till I've thought. You're so confounded sharp.'

Then he played, and there was a dark shadow on the table—we did not know what, but it made our hair stand on end.

'Play fair, Old Un!' says the captain. 'There goes king of trumps. Ha! that's what I thought! Of course, the devil's own luck—it's a proverb. Well, never say die. There!' and he played again.

But we could stand it no longer. We scrambled to our legs, and the next minute were down in fo'castle, rousing the men. They were sleepy enough, you may be bound; but we almost lugged them out of the hammocks. 'Turn out, turn out, shipmates, for God's sake: the devil's aboard this ship, and he's playing cards with the captain in the cabin.' At first, mates, the hands thought we had gone mad; but we both of us told in a breath what we had seen; and so in a minute or two we all went aft, creeping like cats along the deck. But there was no need. We heard Old Goss's voice raging like a fury.

'You're a cheat, Old Un,' he was yelling out. 'You cheat all mankind: you've cheated me. Come, play; double or quits on the first turn-up. What's that? Nine of Spades! Seven of Spades! What! no trumps? I say, don't you mind the old craft under the line? That's her opposite you; so, play away.'

'Mates,' says an old salt—his name was Bartholomew Cook—'mates,' says he, 'this is a doomed ship, and I won't ship for another v'y'ge.'

'Nor I,' 'nor I,' says several, as we crept along.

'He's only mad with drink,' whispered the mate. 'It's all five-water grog.'

'Is it?' said Bartholomew. 'Look down there!'

The men crept to the skylight, and peeped; and so did I. What we saw, not a man forgot the longest day he lived. The captain was dealing the cards furiously; his face working and swelling; his hair bristling up; his good eye gleaming, and the patch off the other, the blind one, which was shining, too, as it were, like a rotten oyster in the dark.

'Play!' roars Goss at last; and then he paused, as if he was thinking of his next card. The table was

rapped. He played; and then quick and furious the cards came down; the captain all the while raving, shouting, and foaming at the mouth.

'Against me—against me—against me! Avaunt! A man's no match for ye. Ye have all! Lost again! No; here—stop. On the next card, I stake myself—my ship—my'—

'Stop!' shouted old Bartholomew. He had been standing at the foot of the companion, and he burst into the cabin. 'Stop, Captain Goss, in the name of God!'

Goss turned round to him. His face was so like the Evil One's that we did not look for any other. Then a brass-mounted pistol—a shot—and rolling smoke: all passed in a minute. Then the captain flung a card upon the table, and with a yell like a wild beast, shouted out: 'Lost!' fell over the cards, extinguished the lamp; and we neither heard nor saw more, till there came a shuffling on the companion, and Bartholomew crawled out with his face all blackened by the powder, and the blood trickling from his cheek, where the ball had grazed it. We all went for'ard, mates, and had a long palaver, and resolved to go ashore at daybreak, and leave a doomed captain and a doomed ship. But we didn't know our man. In the gray of the morning, we heard the handspike rattle on the hatch, and we tumbled up one after the other. The captain was there, looking much as usual, but only paler.

'Man the windlass,' says he.

'We're going ashore, sir,' says Bartholomew firmly.

'How?' says the captain.

'In the boat,' says Bartholomew.

'Are you?' says Goss: 'look at her!' He had cut her adrift, and she was a mile off.

'And now,' says Goss, 'I was drunk last night, and frightened you—playing tricks with cards. Don't be fools; do your duty, and defy Davy Jones. If not'— And then he flung open his pea-coat, and we saw four of the brass-mounted pistols in his belt. But, mates, his one eye was worse than the four muzzles, and we slunk to our work, and obeyed him. The easterly breeze came fresh, and we were soon bowling away nor'ard. The captain stood long at the helm, and we gathered for'ard. 'We're lost!' said Bartholomew; 'we're lost men! We're bought and sold!'

'Bartholomew,' shouts the captain, 'come and take the helm!' He went aft, mates, like a lamb; and the captain walked for'ards, and looked at us, one after another; and the one eye cowed us. We were not like men; and he was our master. When he went below, we grouped together, and looked out to windward. It was getting black—black; the wind was coming off in gusts; and the *Lively Nan* began to dance to the seas that came rolling in from the eastward. 'The equinoctial!' we says one to another. In an hour more, mates, all the sky to windward was like a big sheet of lead; with white clouds, like feathers, driving athwart it—the clouds, as it were, whiter than the firmament. You know the meaning, mates, of a sky like that; and accordingly, by nightfall, we had it; and the *Lively Nan*, under close-reefed main-sail and storm-jib, was groaning, and plunging, and diving in the seas—the wind blowing, mates, as if it would have wrenched the mast out of the keelson. Many a gale have I been in, before and since, but that was the worst of all. Well, mates, we thought we were doomed, but we did our work, silent and steady; and we kept the smack under a press of canvas that none but such a boat could bear, to claw her off the lee-shore—off them fearsome sands that lie all along Lincolnshire. Captain Goss was as bold and cool as ever, and stood by the tiller-tackle, and steered the ship as no hand but his could do.

It was the gloaming of the night, mates, when the gale came down, heavier and heavier—a perfect blast, that tore up the very sea, and drove sheets of water into the air. We were a'most blinded, and clung to

cleats and rigging—the sea tumbling over and over us; and the poor, old smack at length smashed down on her beam-ends. All at once, the mast went over the side; and as we righted and rose on the curl of a sea-way, Bartholomew sung out, loud and shrill: 'Sail, ho!' We looked. Right to windward, mates, there was a sort of light opening in the clouds; something of the colour of the ring round the moon in dirty weather, and nigh as round; and in the middle of it was a smack, driving right down on us, her bowsprit not a cable-length from our broadside. She looked wondrous like the *Lively Nan* herself, and some of us saw our own faces clustered for'ard, looking at ourselves over the bow!

As this notion was passed from one to another, we cried out aloud, that our hour was come. Captain Goss was in the middle of us. 'Hold your baby screeches,' says he. 'You'll be none the worse; it's me and the smack she has to do with.' Even, as he spoke, she was on us. Some fell on their knees, and others clenched their fists and their teeth; but instead of the crash of meeting timber, we heard but a rustle, and the shadow of her sails fitted, as it were, across us; and as they passed, the wind was cold, cold, and struck us like frost; and the next minute the *Lively Nan* had sunk below our feet, and we found ourselves in the roaring sea, struggling among the wreck of the mast. The smack was gone, and the strange ship gone, and the gale blowing steady and strong. One by one, mates, we got astride of the mast, and lashed ourselves with odds and ends of broken rope; and then we began, as we rose and fell on the sea, to look about and muster how many we were. The crew, including the captain, was seven hands, but we were sure there were eight men sitting on the mast. It was too dark to see faces; but you could see the dark figures clinging to the spar.

'Answer to your names, mates,' says Bartholomew, who somehow took the lead. And so he called over the list till he came to the captain.

'Captain Goss?'

'Here,' says the captain's voice.

We now knew there was somebody behind him who was not one of the crew. It was too dark, however, to see distinctly, and Goss interrupted our view such as it was.

'Who is the man on the end of the mast, Captain Goss?' says Bartholomew.

'You might be old enough to guess that!' replied the captain, and his voice was husky-like, but quite clear; and it never trembled. 'Some men call him one thing, some another; and we of the sea call him Davy Jones.'

Mates, at that we clustered up together as well as we could, and fixing our eyes on what was passing at the other end of the mast, we hardly attended to the seas that broke over and over us. At last, we saw Captain Goss, by the light of the beds of bursting foam, fumbling for something in his breast.

'Is it a Bible you have there?' cried Bartholomew.

The captain didn't answer, but pulled out the thing he was trying for; and we guessed somehow, for we could hardly see, that it was the greasy pack of cards.

'Double or quits!' he shouted, 'on all I've staked;' and in another instant there was one horrid, unearthly screech, like what we heard in the cabin before, and the mast, as it were, tipped the heel of it, the cross-trees rising many feet above the water. Whether or no it was the motion of the waves that had tossed it, no man can say; but when the mast rolled again with the next sea, the heel came up empty: Captain Goss and his companion were gone!

'Thank God,' says Old Bartholomew, 'for Jonah is in the sea.' In less than half an hour, mates, we were tossed ashore, without a bruise or scratch. We walked the beach till daylight, and then we saw that the mast had disappeared. None ever saw more a

timber or a rope's-end of the *Lively Nan*. She had been staked and won; but the greasy cards, mates, lay wet and dank upon the beach, and we left them to wither there among the sea-weed.

PARTNERSHIP IN COMMANDITE.

It is a general prejudice, that a subject like the law of partnership is a matter for the legal profession only, or, at most, for the consideration of capitalists embarked in partnership business. But it is, in truth, a subject of great interest to the public at large, and especially to that valuable portion of the community who possess ability and character, and have a little property—but not much—at stake in the soundness of our institutions. This class have, however, of late begun to shew a visible interest in the subject—an interest which, had it existed earlier, might have prevented any of the anomalies of which we complain from increasing to their present excess.

The political economists have ever admitted the great influence of combined capital: they have pointed to many valuable operations, such as gas-works, water-works, railways, &c. which can be performed by combined capital, but are beyond the capacity of individual capitalists. They have also admitted the efficacy of a division or combination of labour; whether it be that of the mechanic, or of some higher grade, such as the designer and projector. The views of the older school of political economists would be in entire concurrence with anything that would facilitate such combinations, where several men with skill or money take their parts; as, for instance, where one is the buyer of raw materials, another keeps the accounts, another draws patterns, and another acts as salesman. On the other hand, some novel speculators go so much farther, that they would revolutionise society, and, by force, compel it to be organised into co-operative sections. It infers no sympathy with these wild schemes of destruction, and artificial reconstruction, to desire that our law should give facility for co-operation and combination—nay, that it should give to it every encouragement consistent with other interests, and with civil liberty.

But our law, unfortunately, instead of doing thus, has set heavy impediments in the way of co-operation; we might speak more strongly, and say, that it has prepared pitfalls, in which any person guilty of having joined in a co-operative scheme, may at once find himself overwhelmed, as a punishment for his offence. Invest part of your savings in a company in which you have reliance; assist a young man, of whose capacity and honesty you think well, by investing money in his business; and some day you may find yourself ruined for having done so.

Those readers who have turned any attention to this subject, will at once see that we refer to the law of unlimited responsibility in partnerships. Except when the company proceeds under an act of parliament, a charter, or patent, limiting the responsibility, every partner is responsible for the debts and obligations of the concern, to the last farthing he possesses. Very often, a young man of enterprise and ability, acting as manager, overseer, or in some other respectable capacity, receives a small share in the profits to encourage him to exertion: he has no control over the management: some leading man plunges, to serve himself, into dangerous speculations, and there is a bankruptcy. The young man has done nothing but good service all along

to the partnership, and to its creditors, and all who have had dealings with it; yet, if he have saved a trifle, it is swept away with the effects of the real speculators. Take another case equally common: A young man commences business alone, or in company with others: they have intelligence, ability, and honesty, but little capital. A capitalist, who, perhaps, conducts some larger business of his own, might, ingrafting kindness on prudential considerations, be inclined to embark with them to a certain extent; but he finds, that instead of a prudential step, nothing could be more thoroughly imprudent. He will have to embark not only the small sum he destined for the purpose, but his whole fortune. Dealers who have transactions with the young partners, will know that a man of fortune is 'at their back,' as it is termed, and will give them credit and encouragement accordingly. Without being conscious of any dishonesty, the firm will be led to trade, not on the capital which their friend has advanced, but on the capital which he possesses. Of course, they do not intend that he should lose his fortune, any more than that they themselves should lose their business and pecuniary means. But these things happen against people's intentions and inclinations; and the friend who wished to aid them with a moderate and cautious advance, is ruined; while those who were giving reckless credit, and who encouraged dangerous speculations, are paid cent. per cent. It is the fear of such a consummation as this that generally makes the well-intending friend abstain from ultimately committing himself with those with whom he would have fain co-operated.

It is quite right that trading companies should not trade on false resources, and be able to laugh at their creditors by placing out of the reach of the law the funds with which they have speculated. Yet this can be done under the present system; and there is a class of men in the commercial world, banded together by peculiar ties and interests, who are said to accomplish it on a large and comprehensive scale. It is thus carried out: A penniless man starts in business, supplied with abundant capital by his friends: they may demand 6, 7, or 10 per cent. for the use of it; and if they manage, which they may, to avoid the residue of the law of usury, they are safe from the law of partnership. The new man, by his prompt payments and abundant command of capital, works himself into good credit. It is an understanding, that when he has been thus set afloat, the money advanced by his friends is to be gradually repaid. He is then left to swim or sink. If the former be his fate, it is well for all parties; if the latter, his friends will not be the sufferers: their capital is preserved, and they can play the same game over again, in some other place, with the hope of an equally happy result.

The same modifications of the law which would free partnership of its terrors would be only naturally accompanied with safeguards to protect the public against such schemes as these. In France, America, and many other countries, there is a system of partnership, with limited responsibility, known by the name of 'Partnership in *Commandite*.' Even with us, limited responsibility is by no means unknown. It is, however, granted capriciously and unsystematically, without those checks and regulations which, if there were a general system, would be adopted to make it safe and effective. 'I wish,' said Mr Duncan, a solicitor, when examined before the Select Committee on the Law of Partnership, 'to draw

the attention of the committee first to this simple fact—that all the railway, gas, and water and dock companies, and all the telegraph companies, as a matter of course, have limited liability. It is impossible to trace why they have got it, but they have got it as a habit, and for any extent of capital they desire. Whether a project be to make a railway from one small place to another, or to provide gas to supply any town, great or small, all those companies, as a matter of course, come to the legislature and ask for, and obtain, limited liability. They are commercial companies, and one cannot trace the reason why they should have limited liability a bit more than any other company—but it is so.

Here we have at least a precedent, which is of importance in a country like this, so truly conservative in the sense of adhering to anything that is fixed law or matter of traditional business routine. Now, in these concerns, where there is often so much wild speculation and mismanagement, no one is responsible beyond the subscribed stock; yet while we hear enough of the stockholders themselves losing their property, we seldom, scarcely ever, hear of the creditors who deal with them, in contracting for their works or otherwise, losing. The reason is, because the extent to which they can pay is known, and the people who deal with the company calculate accordingly. Unlimited liability existing in some indefinite parties, while it too often ruins these parties themselves, is a bait for that indefinite credit which produces their ruin, and sometimes leaves the careless creditor unpaid, even when he has taken the last farthing from the unfortunate partner.

In the commandite partnerships, however, the restriction of liability does not apply to all the shareholders, as in the case of our great joint-stock companies. Full responsibility alights only on those partners who take it upon them, who have an interest in the profits measured by their responsibility, and who are known to the world to be so responsible. With regard to those whose responsibility is said to be limited, it would be more accurate to say, that they have no responsibility at all: there is a fixed sum which they have invested in the concern—they may lose it, but it is there already; and there is nothing for which they have, properly speaking, to be responsible. The method adopted in France may be described thus:—There is a private act or contract, in which are given the names of the partners, and the sums contributed by them. The names of the *gérants*, or those who, as ostensible conductors of the business, are to be responsible to the whole extent of their property, are then published. With regard to those who put in money without incurring farther responsibility, it is only necessary to publish the sums contributed by them: no farther information regarding them would be of any use, unless to their fellow-partners, who would perhaps like to know if the concern is patronised by men of sense, and they may satisfy themselves by looking at the deed of partnership. Now, there is perfect fairness in all this. The public know the persons who agree to take the full responsibility; they know also the amount of money put into their hands by other parties. In deciding whether they shall deal or not with this body, they are not perplexed by mysterious visions of possible rich unknowns who may be brought in for the company's obligations. We cannot see that such an arrangement is in the least unfair, and we are convinced that it would be productive of great good. The subscribers with limited responsibility, or *commanditaires*, as they are called, are not cut off from all control over the management of their funds: it is their own fault if they join a commandite company where they are not allowed to inspect the books, and check rashness or extravagance.

It seems to be frequently the case, that a set of able

workmen, in the kind of artistic manufactures for which France is celebrated, become the *gérants* of such companies. This, we believe, is a form in which whatever element of good may happen to lie in the co-operative theories of a recent school of Socialists will be found. The commercial witnesses before the select committee, spoke of ribbons and other ornamental manufactures, which were only produced in perfection in establishments where the energies of the designers were roused by the possession of a share in the business, and in its management, as *gérants*. Coinciding with these practical witnesses, the theorists on political economy who were consulted on the occasion—such as Mr Babbage and Mr J. S. Mill—held that many inventions that might be patented and used, and many ingenious discoveries made by men of the operative class, were lost to the world by the defective state of the law. They would often get those who, richer than themselves, have reliance on their judgment, to aid them in carrying out their inventions or improvements, were it not for the law of unlimited responsibility.

We can even anticipate, from anything that will facilitate fruitful investment by the working-classes, a still wider—we might say, a political effect. The chief defect in our otherwise sound social system, is the want of fusion between the class of employers and employed. As some other countries are subject to the more serious evil of being without a middle-class between the aristocracy and the common people, so we want a sub-grade, as it were, between the middle and the working classes. It is too much the practice to consider them as separated from each other by interests, tastes, and feelings. It is, on the contrary, the real truth that their interests are indissolubly united; but if there were a less broad line separating them from each other, this would be more apparent. The true way to fill up the gap happily for all parties, is not for the middle-class to descend, but the working-class to rise. Nothing could better accomplish this, than imparting to them facilities for entering into business on a small scale on their own account. The hopelessness with which the workman looks at the position of the employer, as that of a great capitalist, would then be turned into hope and endeavour.

It is often said, that the operative classes shew an unfortunate indisposition to advance onwards, and abandon their uniform routine of toil: the answer to this is—try them. They have adopted the means at their command in other countries. Mr Davis, an American gentleman, gave the select committee an animated view of the ambitious workmen of the New England states, where, he said, 'nobody is contented with his present condition—everybody is struggling for something better.' Now, to be discontented with one's condition, in the shape of folding the arms, and abusing the fate that has not sent chance prosperity, is a bad thing; but the discontent—if such it can be justly called—which incites a man to rise in the world by honest exertions, is in every way a good thing. Mr Davis said, he has been told that, in Lowell, some of the young women hold stock in the mills in which they work. Imagine a factory-girl holding stock in a mill!

We believe that unlimited responsibility was really founded on the old prejudices against usury or interest; and as these prejudices are fast disappearing, we may hope speedily to see this relic of their operation removed. Towards this end, let the operatives everywhere meet to consider this question, so important to their interests; and, as we believe they will generally see the propriety of furthering a law to establish commandite partnerships, let them petition the House of Commons accordingly. Whether the classes with capital will move in the matter, is doubtful; for they are not the parties to be chiefly benefited. The best way is not to trust to them on the subject; but for the working-classes to take the thing into their own hands,

and spare no exertion to procure an act of parliament of the kind we speak of. We feel assured, that such an act would do more to inspire hope among artisans, and to put them in the way of fortune, than any other law that could be mentioned.

RECENT FIRE-PANICS.

THE panic created by a cry of fire in theatres, churches, and other public buildings, may be said to cause a considerably greater number of deaths than the flames themselves. Few persons, indeed, are burnt to death, means of escape from conflagration being usually found; whereas, the number suffocated and bruised to death by mere panic, is lamentably large. The following is the account of a most disastrous fire-panic, which we gather from a paper in an American Journal of Education.

In the city of New York there is a school, known as the 'Ninth Ward School-house,' Greenwich Avenue. The house is built of brick, and consists of several floors, access to which is obtained by a spiral staircase. The bottom of the staircase is paved with stone, and ten feet square in extent. Standing in the centre of this landing-place, we look up a circular well, as it may be called, round which the stair winds with its balustrade. The school is attended by boys and girls, in different departments, under their respective teachers. It was in this extensive establishment, numbering at the time 1233 boys and 600 girls, that the panic occurred, and it broke out in a singular and unexpected way.

One day last December, Miss Harrison, a teacher in the female department, who had been for some days indisposed, was suddenly, and while performing her duties in the school, seized with a paralysis of the tongue. The spectacle of their teacher in this distressing condition, naturally suggested to the children that she was faint, and required water. At all events, the word *water* was uttered. It was repeated. It became a cry; and the cry excited the idea of fire. A notion sprang up that the school was on fire. That was enough. The floor was in an uproar; and the noise so created in one department was communicated to the others. The whole school was seized with panic! Now commenced a rush towards the various doors. Out of each poured a flood of children, dashing wildly to the staircase. The torrent jammed up, and unable to find outlet by the stair, burst the balustrades, and down like a cataract poured the maddened throng into the central well, falling on the paved lobby beneath. The scene was appalling. 'Before the current could be arrested, the well was filled with the bodies of children to the depth of about eight feet. At this juncture, the alarm reached the Ninth Ward Station-house, the fire-bell was rung, and a detachment of the police hurried to the scene. Here a new difficulty presented itself. The afternoon session of the school having commenced, the main outer-doors, which open upon the foot of the stairs, had been closed. Against these the affrighted children were wedged in masses, and as the doors open inward, it was some time before relief could be given them. The police fortunately effected an entrance by a rear-door, but for which timely help, many more of the children would probably have been suffocated.

'Much commendation is due to the teachers for their presence of mind. Miss M'Farland, one of the assistants in the primary department, finding the children of her department becoming alarmed, placed herself in the doorway, and exerted her utmost strength to arrest them as they endeavoured to rush from the room; and although several times thrown down and trampled upon, she still persisted in her efforts, until, finally, she was so much injured, as to be compelled to relinquish the post. So impetuous was the rush, however, that five of the teachers were forced over the balusters, and fell with

the children into the well. The sterner discipline exercised over the boys' departments prevented them generally from joining in the rush. Only three of the pupils in the upper male department were among the killed. Some of the boys jumped out of the windows, and one of them had his neck broken by the fall. As soon as they gained admittance, the police took possession of the premises, and commenced handing out the children from their perilous position. Those that were on the top were but slightly injured; but as soon as these had been removed, the most heart-rending spectacle presented itself. Some among the policemen were fathers, whose own children were there. They worked manfully, and body after body was taken out: many of them lifeless at first, came to when they once more breathed the fresh air; but many were beyond aid, and death was too plainly marked upon their pallid features. Some were injured by the fall, and lay writhing in agony; some moaned; while others shrieked with pain; and others, again, when released, started off for home, apparently unconscious of the awful scene through which they had passed. The bodies of the dead and wounded were mostly taken to the Ninth Ward Station-house, which is near the school. In a few minutes, news of the accident spread through the neighbourhood, and mothers came rushing to the scene by scores. Occasionally, a mother would recognise the lifeless form of a child as it was lifted from the mass, and then the piercing cry of agony that would rend the air! One after another, the bodies of the dead were removed; and at length litters were provided, and the wounded were carried away also. Nearly one hundred families either mourned the loss of children, or watched anxiously over the forms of the wounded.'

The coroner's jury which sat on this case of wholesale destruction of life, decided that no blame could be imputed to any of the teachers in the school, and that the deaths were a result of accident. At the same time, they strongly condemned the construction of the stair, and the unfitness of the balustrades to withstand pressure. The whole case suggests the impolicy of giving spiral staircases to buildings of this class: in all such establishments, the stairs should be broad and square, with numerous landing-places.

Strangely enough, the sensation caused by the above catastrophe had not subsided, when another case of destruction of life occurred in New York from a similarly groundless fear of fire. This second disaster is noticed as follows in the newspapers:

'Monday night (January 12), between the hours of nine and ten o'clock, a frightful calamity occurred at 140 Centre Street, in a rear building owned by the Commissioners of Emigration, for the reception of the newly-arrived emigrants. The building is five storeys high, and each floor appropriated for the emigrants—the upper rooms principally for the women, and the lower part for the men. In this place, six human lives were lost, and perhaps as many more may yet die from the injuries sustained. It seems that between nine and ten o'clock, the City Hall bell rang an alarm of fire in the fifth district, and some of the women on the upper floors called out "fire," which instantly created a panic of alarm on each floor among them, and a general rush was made for the stairway, which being very contracted, they fell one on the top of each other, creating an awful state of confusion. So terrified were some, that they broke out the second and third storey windows, and sprang out, falling with deadly violence in the yard below. The screams and cries of the affrighted women and children soon called the aid of the police; and Captain Brennen, aided by his efficient officers, rendered every assistance in his power, and succeeded, as quickly as possible, in extricating the injured as well as the dead from the scene of calamity. Six dead bodies were conveyed to the station-house, and eight persons were conveyed to the city hospital with broken arms and bodily injuries,

some of whom are not expected to survive. Many others were injured, more or less, but not deemed sufficiently so to be sent to the hospital. Those killed are all children, except one, who is a young woman about twenty years of age. They were all suffocated by the number of persons crowded on them. The scene at the Sixth Ward Station-house presented a woful sight, the mothers of the deceased children bewailing over them in the most pitiful manner. At the time the alarm was given, there were about 480 emigrants in the building, the larger proportion women and children, who were up stairs; and in forcing their way down stairs, the balusters gave way, thus precipitating them down in a very similar manner to the unfortunate children at the Ninth Ward School-house. There was, it seems, no cause for the alarm of fire any more than the bells rang an alarm; which alarm did not refer to that district, but was misconstrued by the emigrants to be in their building. Alderman Barr was quickly on the spot, rendering every assistance in his power to alleviate the sufferings of the poor unfortunate emigrants.

The details of these two calamities arising from sheer panic will not be useless, if they serve to shew the extreme danger and folly of giving way to a terror of fire in crowded buildings. Let us impress upon all the necessity for so disciplining their nerves, that on hearing a call of fire in a church, theatre, or other place of assemblage, they may act with calmness and common sense; those nearest the door going out, and the others quietly following. It is in the highest degree improbable—not to say impossible—that in such places fire, before its discovery, can gain such a height as to cut off, unaided by panic, the escape of a single man, woman, or child in the house. We should remember, that not merely on the first discovery of fire, but when the building is actually in flames, the firemen are at work within the walls; and that these men are protected by no immunity but that arising from their own courage and self-possession.

THINGS TALKED OF IN LONDON.

February 1852.

PROFESSOR FARADAY's lecture, with which, according to use and custom, the Friday evening course at the Royal Institution was opened, has been the most noteworthy topic of scientific gossip since my last. The subject, 'Lines of Magnetic Force,' is one not easily popularised, otherwise, I should like to give you an abstract of it. One requires to know so much beforehand, to comprehend the value and significance of such a lecture. The learned professor's experiments, by which he demonstrated his reasonings were, however, eminently interesting to the crowded auditory who had the good fortune to listen to him. He promises to give us, before the close of the season, another, wherein he will make use of that telescope of the mind—speculation, and tell us much of what his ever-widening researches have led him to conclude concerning magnetism; a science on which he believes we are shortly to get large 'increments of knowledge.' Mr Wheatstone, too, having produced a paper resuming his stereoscopic investigations, had the honour of reading it before the Royal Society as their Bakerian Lecture, as I prognosticated a month or two since. Of course in this practical age the inquiry is put—Of what use is the stereoscope or pseudoscope? With respect to the former, it is said that artists will find it very serviceable in copying statuary groups; and a suggestion has already been made, to adapt it to the purposes of microscopic observation, as the objects examined will be seen much more accurately under the extraordinary

relief produced by the stereoscope, than by the ordinary method. And it may interest astronomers to know, that Mr Wheatstone believes it possible, by means of the same instrument, to perfect our knowledge of the moon's surface and structure. For instance: he proposes to take a photographic image of the moon, at one of the periods of her libration, and a second one about fifteen months afterwards, at the next libration, which, as you know, would be in the opposite direction to the first. The two images being then viewed in a stereoscope, would appear as a solid sphere, in which condition we should doubtless get such an acquaintance with the surface of our satellite as can be obtained by no other means. The reason for taking the images with so long an interval between is, that although each one represents the same object, each must be taken at a different angle; and for an object so distant as the moon, the difference caused by the libration would, it is believed, be sufficient for the desired result. In the small pictures, however, the difference of angle is so slight, that to the unpractised observer they appear precisely alike; it is, nevertheless, essential to the effect that the variation, though minute, should exist. With respect to the pseudoscope—which makes the outside of a teacup appear as the inside, and the inside as the outside; which transforms convexity into concavity, and the reverse; and a sculptured face into a hollow mask; which makes the tree in your garden appear inside your room, and the branches farthest off come nearest to the eye; and which, when you look at your pictures, represents them as sunk into a deep recess in the wall,—with respect to this instrument, its practical uses have yet to be discovered. But as your celebrated countryman, Sir David Brewster, is working at the subject, as well as Mr Wheatstone, we shall not, so say the initiated, have to wait long for further results.

Besides these lectures, a course is being delivered at the Museum of Practical Geology, recently opened in Jermyn Street, by eminent professors, as you may judge from the fact of De la Beche, Forbes, and Playfair being among them. Some of the most promising of the pupils at the School of Design are allowed to attend these lectures gratis. At the same institution, an attempt is to be made to do what has long been done in Paris—namely, to admit working-people to the best scientific lectures free of cost. Now, therefore, is the time for the working-men of the metropolis to shew whether they wish for knowledge and enlightenment or not. They have only to present themselves at the Museum, pay a registration-fee of sixpence, conform to the rules, and so qualify themselves for the course of six lectures. It is a capital opportunity; and I, for one, hope that hundreds of the intelligent working-men of London will avail themselves of it. They, on their part, may find government education not unacceptable; and government, on the other hand, encouraged by a successful experiment, may feel inclined to extend its benefits. If a clear-headed lecturer on political economy could also be appointed, perhaps in time our industrial fellow-countrymen might come to understand that strikes are always a mistake, and the masters, that fair play is a jewel.

Notwithstanding the stir about invasion and amateur rifle-clubs, other matters do get talked about—as, for instance, the astronomer-royal's communication to the Society of Antiquaries on the place of Cæsar's landing at his invasion of Britain. The learned functionary settles it to his own satisfaction by tide-calculations: he has also been holding an interesting correspondence with a lady on the geography of Suex, as bearing on the Exodus of Scripture. And this reminds me that Dr J. Wilson has written a paper, published in the proceedings of the Bombay branch of the Royal Asiatic Society, to decide a long debated question—the identification of the Hazor of Kedar, referred to in Jeremiah—'Concerning Kedar, and concerning the kingdoms of

Hazor, which Nebuchadrezzar king of Babylon shall smite,' &c. The doctor, after careful research and reasoning, believes the ruins known as Hadhar or Hatra, not far distant from Nineveh, to be the remains of the denounced city. Layard and Ainsworth have both visited and described the place, as many readers will remember. Those interested in the progress of research in Biblical countries, will be gratified to know that Dr Robinson has left the United States for another tour in the Holy Land. Now that Christians are more tolerated in Turkey than in some other countries nearer home, travelling in the East will perhaps be facilitated.

Talking of travel: the Legislative Council at Sydney have granted L.2000, to fit out an expedition to search for Leichardt; Captain Beatson, with his steamer, is about to start for Behring's Strait to look for Franklin; Lieutenant Pim has returned from St Petersburg—the emperor would not permit him to go to Siberia; and last, supplies of money and goods have been sent out to Drs Barth and Overweg, in Central Africa, to enable them to pursue their discoveries; and the British resident at Zanzibar has been instructed to assist them. We may thus hope, before long, to add to our knowledge both of the torrid and frigid zones.

To touch upon a home topic: we are told that governments are rather afraid of their own bill for intermental interments passed last session, which may account for none of its provisions having yet been carried out. The project now is to supersede that bill by another, which is to extend the practice of cemetery interment. This looks like a want of faith in sanitary principles. On the other hand, the sale of the lazaretto at Marseilles, with a view to construct docks on its site, is a proof that the French government can do something in the way of sanitary reform. It is, in fact, quite time that the superstitious notions about infection, and the vexations of quarantine, should give place to sounder views and more rational methods. Meantime, as meteorologists say, we are coming to the cycle of hot summers, it behoves us more than ever to bury the dead far from towns. The Registrar-General tells us that, on the whole, we are improving, and it is not less an individual than a national duty to forward the improvement. According to the return just published for the quarter ending December last, the births in 1851 amounted to 616,251, the largest number ever registered, being an excess of 5 per cent. over former returns. The deaths were 385,938, leaving a surplus which increases the population of England and Wales to more than 18,000,000. In the same quarter, 59,200 emigrants, chiefly Irish, left the kingdom. With respect to marriages, which also exceed in number those of former years, the Registrar repeats what he has often said before, that marriages increase 'when the substantial earnings of the people are above the average; and the experience of a century, during which the prosperity of the country, though increasing, has been constantly fluctuating, shews that it is prudent to husband the resources of good times against future contingencies. Workmen, if they are wise, will not now squander their savings.' Are we to infer from this, that a bad time is coming?

I have at times given you some of our post-office statistics, let me now send you a few from America. The postmaster-general reports to Congress, that in the year ending last June there were within the United States 6170 mail-routes, comprising a length in the aggregate of 196,200 miles; of post-offices, 19,796; of mail-contractors, 5544. The distance travelled in the year over these routes was 53,272,252 miles, at a cost of 3,421,754 dollars, or rather more than six cents per mile per annum. On more than 35,000,000 of these miles the service is performed by coaches, and 'modes not specified;' the remainder by railway and steam-boat. There were six foreign mail-routes on which the annual

transportation was estimated at 615,206 miles. The gross receipts of the post-office department for the year amounted to 6,786,493 dollars, being an increase of nearly a million over the preceding year. If, after this, we can only get Ocean Penny Postage, we will give the republican postmaster work to do that shall add some score of pages to his report.

You will perhaps remember my telling you, some time ago, of the discussion that had been going on in the United States respecting a prime meridian. Something has now come of it. The committee appointed by Congress to consider the subject, have recommended 'that the Greenwich zero of longitude should be preserved for the convenience of navigators; and that the meridian of the National Observatory—at Washington—should be adopted by the authority of Congress as its first meridian on the American continent, for defining accurately and permanently territorial limits, and for advancing the science of astronomy in America.' This decision, though it may disappoint those who consider it derogatory to the national honour to reckon from the meridian of Greenwich, is nevertheless the true one. In connection with it, the Americans intend to bring out a nautical almanac.

Another topic from the same quarter is, that Professor Erni of Yale College has been making an interesting series of experiments on fermentation—a process of which the original cause has never yet been satisfactorily explained, and is still a moot-point with chemists. They tell us it is one by which complex substances are decomposed into simpler forms, as some suppose, by chemical action; others, by development of fungi, different in different substances. Among the experiments, it was observed that the yeast of cane-sugar solution produced no fermentation whatever when poisoned with a small quantity of arsenious acid; with oil of turpentine, and creasote, similar negative results were obtained. The introduction of cream-of-tartar along with the arsenic neutralised its effect, but not so with the other two; and, singularly enough, the appearance of the liquor always shewed when the poisoning was complete; 'the nitrogenous layer on the cell-membrane seeming to have undergone a change similar to that produced by boiling.' Judging from the results, Professor Erni believes 'that alcoholic fermentation is caused by the development of fungi. He could never trace the process without observing at the very first evolution of carbonic acid, the formation of yeast-cells, although it is very difficult to decide certainly which precedes the other.' His own opinion is in favour of the commencement by the yeast-cells.

Another noteworthy subject, is Dr W. J. Burnett's paper to the American Association, 'On the Relation of the Distribution of Lice to the Different Faunas,' in which he endeavours to demonstrate, that the creation of animals was a multiplied operation, carried on in several localities, and that they do not derive from one original parent stock. Different animals have different parasites; but, as he shews, the same species of animal has the same parasite, wherever it may be found. According to Latreille, the *pediculus* found in the woolly heads of African negroes 'is sufficiently distinct from that of the Circassian to entitle it to the rank of a distinct species;' from which, and similar instances, the doctor concludes: 'Whatever may be urged in behalf of the hypothesis of the unity of the animal creation, based upon the alleged metamorphic changes of types, it is my opinion that the relations of their parasites, and especially the lice which are distributed over nearly all of them, must be considered as fair and full an argument as can be advanced against such hypothesis, for it is taking up the very premises of the hypothesis in opposition.' Dr Burnett will perhaps find Sir Charles Lyell ready to break a lance with him on the point at issue.

Something interesting to workers in metal has been

brought before the Franklin Institute at Philadelphia—it is a method of giving to iron the appearance of copper, contrived by Mr Pomeroy of Cincinnati, who thus describes it—rather laboriously, by the way:—

'Immerse the iron in dilute sulphuric acid, for the purpose of cleansing the surface of the article which is to be coated; and thus cleansed, submit the iron to a brisk heat to dry it; when dry, immerse the article in a mixture of clay and water, and again dry it so as to leave a thin coating of the clay on its surface: it is then to be immersed in a bath of melted copper, and the length of time requisite for the iron and copper to form a union, will depend on the thickness of the article under operation. The object of the clay is to protect the copper from oxidation during the process of alloying or coating, and to reduce it to the required thickness it is passed between rollers. The result of this annealing process will be a smooth surface, fully equal to the brightness of pure copper.' Let me add to this, as a finish to transatlantic matters, that a Mr Allan, at St Louis, having observed that in washing-machines only the linen on the outside of the heap was perfectly cleansed, has patented a new machine, which comprises a chamber or tub with a narrowed neck, in which a plunger is inserted; and this, 'with the clothes wrapped around it, passes through the narrowed neck of the chamber, and pressing forcibly on the water confined within, drives it violently through the body of the clothes, carrying the dirt with it.'

Science is not idle in France, notwithstanding the social perturbations: some of our engineers are talking about the trials of electro-magnetic locomotives recently made on one of the railways in that country, and are rather curious as to what may be the result. To travel without the whiz and roar of steam would be a consummation devoutly desired by thousands of travellers. And among the topics from the Académie, there is one important to the naval service—M. Normandy's apparatus for converting sea-water into fresh water. Briefly described, it is a series of disks, placed one above the other, communicating by concentric galleries, and placed in a vapour-bath at a pressure a little above that of the atmosphere. 'The sea-water,' says the inventor, 'circulating in the galleries heated by the surrounding vapour, gives off a certain quantity of vapour, which, mingling with the atmospheric air, introduced by a tube from the outside, finally condenses as perfectly aerated fresh water in a refrigerator, which is also in communication with the atmosphere. No other means of agitation or percolation is so efficacious or economical.' The apparatus, which is free from the defect of depositing salt while distillation is going on, is rather more than three feet in height, and eighteen inches diameter. It will yield two pints of water per minute, at an expenditure of about 2½ lbs. of coal for each 45 lbs. of water.

Next, Monsieur Rochas proposes a method for preserving limestone monuments and sculptures for an indefinite period. This material, as is well known, is very liable to disintegrate, and the remedy is to silicify it. Specimens of limestone so prepared were exhibited to the Académie, but without any explanation of the process. We know that brick and stone have been coated with glass in a few instances, to insure their preservation; and that at Professor Owen's suggestion, some decomposing ivory ornaments, sent over by Mr Layard, were restored by boiling in gelatine; but M. Rochas aims at something still greater—nothing less than the silicifying of a number of crumbling limestone statues which have been lately discovered by a Frenchman who is exploring the temple of Serapis at Memphis. They will then be strong enough to bear removal.

Naturalists may learn something from Monsieur Falcoy, who states that a solution of sulphate of zinc is an effectual preservative of animals or animal substances, intended for anatomical examination—it may be

used to inject veins, and the effects last a considerable time. Another consideration is, that it is harmless: dissecting-instruments left in the solution for twenty-four hours were not at all injured.

A WORD TO GENTEEL EMIGRANTS.

THE tide of emigration is rushing so powerfully through the land, that not only labourers and artisans are swept away in its stream, but many of the gentry of the country are beginning to join in the movement, and wonder what they are to do with their young 'olive branches,' 'unless they emigrate to Australia, and found a new home and plant a new family there.' Many of the class have taken this step, and many more are lingering on the brink; and endless and anxious are the inquiries constantly made for the reports transmitted by those adventurous spirits who have led the way to new worlds of enterprise. For the working-classes, all has hitherto been favourable; but for the class above them—the professional man, and the small capitalist—the accounts are not, on the whole, encouraging. 'The labour-market is never overstocked; but,' says a correspondent of a later date, 'I pity the professional men, the doctors and lawyers, who come out, and the clerks, few of whom are wanted, and who find provisions and house-rent much dearer than at home, and to whom the privations they undergo must be great hardships. Men used to the everyday luxuries of a London life, delicate women bred up in habits of expense and idleness, have a severe ordeal to go through on their arrival in that land of work.' The change of climate, and the discomfort of their hastily-raised log-cabin, often entered upon when not half dried, frequently produce fevers, which, at home, would require a long succession of nursing, medical attendance, and afterwards change of air; but with only a *help*, absent whenever it pleases her, often with no medical advice within reach, a damp and cold house half furnished, an uncertain supply of even common necessities, and a total absence of all luxuries, it is really surprising that recovery takes place at all. Now, it unfortunately happens, that the previous education of all these emigrants has been directly adverse to that which would have been desirable for such an after-life. Young ladies and gentlemen are taught dependence as a duty of civilised life. Children are naturally independent and active, and would gladly use their activity in helping themselves. How proud is a child to be allowed to do any of the servant's work! and how awful the rebuke that follows the attempt; till at last, poor human nature is cramped, shackled, and gagged.

Hard, then, seems the destiny that removes these pampered children of European society from their luxurious necessities—the valet, the lady's-maid, and all the other appendages—and leaves them wholly to their own resources, with their self-inflicted ignorance, and their blundering attempts to remedy it.

I have, therefore, to propose to all who intend to emigrate, that they should—before taking a step involving so great an outlay, and the breaking-up of their life here—submit themselves to an ordeal of six or twelve months, in order to ascertain whether, in truth, their bodies and minds are fitted for the situation they are entering upon. Let any gentleman who is thinking of settling in Canada or Australia, take a *labourer's* cottage in a distant county—a few pounds will supply one infinitely superior in comfort and healthfulness to the log-cabin of the bush that is to be his ultimate destination—let him take a little land and a bit of garden in a good farming county; engage one farm-servant (unless he has sons able to take his place), and a rough country-girl to do the coarse work

of the house. The ladies of the family must, of course, perform all the rest: wash all the fine linen, iron, make the beds, sweep the rooms, superintend and assist in the cooking, the dairy, care of the poultry and the pigs; for, of course, such appendages must be indispensable in such an establishment. The gentlemen will work on the farm, cultivate the garden, and gain all the experience they can in manual trades, carpentering and cabinet-making; and thus by degrees the whole family will have their bodies and minds strengthened, and their habits formed for their new work; or they will discover, as many have done when too late to draw back, that the effort is beyond their powers—that the tastes and habits of social life are too closely entwined with their whole being, to leave them the power to withdraw from them at will.

This may seem a forbidding picture, but I can assure them it is very far superior in comfort to the realities they will find in the bush. It is true, that this retirement will effectually withdraw them from their magic circle of friends and luxuries; but let us for a moment compare the two steps, migration and emigration, and ask ourselves if the experiment above mentioned be not worth the trial. In the one, we give up, probably for life, our country, our friends, and generally a part of our family, with all the comforts of a state of law and civilisation; we enter upon a certain and constant life of labour, after a long, tedious voyage; and, if in mature age, bear about with us a never-ceasing yearning for home, which retains its place in our hearts with all the heightened colours with which memory invests it. In the other, we must, it is true, separate ourselves from our long list of acquaintances, and be absent from the dinner-party and the ball; but all our interest in social life will be kept up: we can see at least a weekly newspaper; and although we may have descended a few steps in the social scale, we shall not be obliged to make the acquaintance of convicted felons.

Another view of this plan may be taken. Suppose ten, or twenty, or thirty persons of narrow means were to associate for the purpose of taking some large, old-fashioned house in the country—many such may be found—and agree upon a joint scheme of cheap living and independent labour, plain and economical dress, plain furniture, and a simple but wholesome table: would not this be better than all the risks and privations of expatriation? The Americans do not emigrate—they migrate; and there are spots in any of these three kingdoms, as wild, as solitary, and as healthful, as can be found in the regions of the Far West. But we do not, however, suggest migration as a substitute for genteel emigration—although we suspect it would in many cases prove so—but merely as a step towards it—a school of trial, or training, or both.

COLOURS IN LADIES' DRESS.

Incongruity may be frequently observed in the adoption of colours without reference to their accordance with the complexion or stature of the wearer. We continually see a light-blue bonnet and flowers surrounding a sallow countenance, or a pink opposed to one of a glowing red; a pale complexion associated with a canary or lemon yellow, or one of delicate red and white rendered almost colourless by the vicinity of deep red. Now, if the lady with the sallow complexion had worn a transparent white bonnet; or if the lady with the glowing red complexion had lowered it by means of a bonnet of a deeper red colour; if the pale lady had improved the cadaverous hue of her countenance by surrounding it with pale green, which, by contrast, would have suffused it with a delicate pink hue; or had the face

‘Whose red and white,
Nature's own sweet and cunning hand laid on,’

been arrayed in a light-blue, or light-green, or in a

transparent white bonnet, with blue or pink flowers on the inside—how different, and how much more agreeable, would have been the impression on the spectator! How frequently, again, do we see the dimensions of a tall and *embonpoint* figure magnified to almost Brobdingnagian proportions by a white dress, or a small woman reduced to Lilliputian size by a black dress! Now, as the optical effect of white is to enlarge objects, and that of black to diminish them, if the large woman had been dressed in black, and the small woman in white, the apparent size of each would have approached the ordinary stature, and the former would not have appeared a giantess, or the latter a dwarf.—*Mrs Merrifield in Art-Journal.*

SITTING ON THE SHORE.

The tide has ebbed away;
No more wild surgings 'gainst the adamant rocks,
No swayings of the sea-weed false that mocks
The hues of gardens gay:
No laugh of little wavelets at their play;
No lucid pools reflecting heaven's broad brow—
Both storm and calm alike are ended now.

The bare gray rocks sit lone;
The shifting and lies spread so smooth and dry
That not a wave might ever have swept by
To vex it with loud moan;
Only some weedy fragments blackening thrown
To rot beneath the sky, tell what has been,
But Desolation's self is grown serene.

Afar the mountains rise,
And the broad estuary widens out,
All sunshine; wheeling round and round about
Seaward, a white bird flies;
A bird! Nay, seems it rather in these eyes
An angel; o'er Eternity's dim sea,
Beckoning—‘Come thou where all we glad souls be.’

O life! O silent shore
Where we sit patient! O great Sea beyond,
To which we look with solemn hope and fond,
But sorrowful no more!—
Would we were disembodied souls, to soar,
And like white sea-birds wing the Infinite Deep!—
Till then, Thou, Just One, wilt our spirits keep.

THE PALO DE VACA, OR COW-TREE OF BRAZIL.

This is one of the most remarkable trees in the forests of Brazil. During several months in the year when no rain falls, and its branches are dead and dried up, if the trunk be tapped, a sweet and nutritious milk exudes. The flow is most abundant at sunrise. Then, the natives receive the milk into large vessels, which soon grows yellow and thickens on the surface. Some drink plentifully of it under the tree, others take it home to their children. One might imagine he saw a shepherd distributing the milk of his flock. It is used in tea and coffee in place of common milk. The cow-tree is one of the largest in the Brazilian forests, and is used in ship-building.

THE CHARITABLE CHUMS' BENEFIT CLUB.

THE 'Mother Bunch' public-house stands modestly aside from the din, traffic, and turmoil of a leading London thoroughfare, and retires, like a bashful maiden, from the gaze of a crowd to the society of its own select circle. It is situated in a short and rather narrow street, leading from an omnibus route running north from the city to nowhere in particular—or, if particulars must be given, to that complicated assemblage of carts, cabs, and clothes-lines; of manure heaps and disorganised pumps; of caged thrushes, blackbirds, and magpies; of dead dogs and cats, and colonies of thriving rats; of imprisoned terriers and goats let out on parole; of shrill and angry maternity and mud-loving infancy; and of hissing, curry-combing grooms and haltered horses, to which Londoners have given the designation of a *Mews*. Mr Peter Bowley, the landlord of the 'Mother Bunch,' was the late butler of the late Sir Plumberry Muggs; and having succeeded, on the demise of the baronet, to a legacy of £500, and finding himself unable any longer to resist the charms of his seven years' comforter and counsellor, the cook, supplemented as they were by the attractions of a legacy of the like amount, he had united his destiny and wealth with hers in one common cause. The name of Sir Plumberry Muggs, even though its worthy proprietor was defunct, was still of sufficient influence to procure a licence for his butler; and within a few months of his departure, Mr Bowley had opened the new Inn and Tavern for the accommodation of Her Majesty's thirsty liegés. He had congratulated himself upon the selection of the site, and upon the suitability of the premises to the requirements of a good trade; and his heart swelled within him, as he sat at the head of his own table, on the occasion of the house-warming, dispensing with no niggard hand the gratuitous viands and unlimited beer, which were at once to symbolise and inaugurate the hospitality of his mansion. He had a snug bar curtained with crimson drapery, for the convenience of those who, declining the ostentation of the public room, might prefer to imbibe their morning-draught with becoming privacy. He had a roomy tap-room, where a cheerful fire was to blaze the winter through, and a civil Ganymede minister to the wants of the humblest guest. There was a handsome parlour hung round with sporting-prints, with cushioned seats and polished mahogany tables, where the tradesmen of the neighbourhood might take their evening solace after the fatigues of business; and, more than all this, he had an immense saloon on the first floor above, calculated for social conviviality on the largest scale, and furnished with mirrors, pictures, and an old grand-piano, a portion of the *lores* of the deceased Sir Plumberry Muggs.

Mr Bowley, however, soon made the displeasing discovery, that it is one thing to open an establishment of the kind—which had already swallowed up two-thirds of his capital—and another thing to induce the public to patronise it. Notwithstanding the overflow which had gathered at his house-warming, and the numberless good wishes which had been expressed, and toasts which had been drunk to his prosperity, yet the prosperity did not come. Of the hundred and fifty enthusiastic well-wishers who had done honour to his entertainment, squeezed his hand, and sworn he was a trump, not a dozen ever entered the house a second time. Do what he would, Bowley could not create a business; and the corners of his mouth began visibly to decline ere the experiment had lasted a couple of months. He made a desperate effort to get up a Free-and-easy; he had the old piano tuned, and set an old fellow to play upon it with open windows; exhibited a perpetual announcement of 'A Concert this Evening;' and himself led off the harmony, to the tune of *Tully-ho*, at the top of his voice. It was all of no avail. The half-dozen grooms who joined in feeble chorus did not pay the expense of the gas; and he found the Free-and-easy, without abettors, the most difficult thing in the world. So he gave it up, and fell into a brown study, which engrossed him for a month. He had visions of Whitecross Street before his eyes; and poor Mrs Bowley sighed again, and sighed in vain, after the remembrance of Sir Plumberry's kitchen, and its vanished joys. The only symptom of business was the gathering of half-a-dozen nightly customers, who sipped their grog for an hour or two in the parlour; and one of these, moreover, had never paid a farthing since he had patronised the house. There were twenty grogs scored up against him, besides a double column of beers. Mr Bowley will put an end to that, at anyrate; so he signals the bibulous debtor, and having got him within the folds of the crimson curtains, he politely informs him, that credit is no part of his system of doing business, and requests payment. Mr Nogoe, the convivial defaulter, who is a gentleman of fifty, who has seen the world, and knows how to manage it, is decidedly of Bowley's opinion—that, as a general rule, credit is a bad plan; inasmuch as, so far as his experience goes in the public line, to afford it to your customers, is the first step towards losing it yourself. But he feels himself free to confess, that he is at the present moment under a cloud, and that it would be inconvenient to him to liquidate his score just then, though, of course, if Bowley insists, &c. While Bowley is pausing to consider which will be the best way to insist, Mr Nogoe carelessly leads the conversation to another topic, and begins to descant upon the marvellous capabilities of

the 'Mother Bunch' for doing a first-rate trade; and hints mysteriously at the splendid thing that might be made of it, only supposing that his friend Bowley knew his own interest, and went the right way to work. The landlord, who is now all ear, and who knows his own interest well enough, pours out to his guest a glass of his favourite 'cold without,' and seating himself opposite him at the little table, encourages him to be more explicit. A long private and confidential conversation ensues, the results of which are destined to change the aspect of affairs at the 'Mother Bunch.' We shall recount the process for the information of our readers.

Next morning, Mr Bowley is altogether a new man; brisk, cheerful, and active, he has a smile for everybody, and a joke and a 'good-morning' even for the cobbler, who has the cure of soles in that very questionable benefice, the Mews. He visits his tap-room guests, and informs them of a plan which is in operation to improve the condition of the labouring-classes, of which they will hear more by and by. He is profoundly impressed with the sublime virtues of charity, benevolence, brotherly love, and, as he terms it, all that sort of thing. Day after day, he is seen in close confab with Mr Nogoe, who is now as busy as a bee, buzzing about here, there, and everywhere, with rolls of paper in his hand, a pen behind his ear, and another in his mouth, and who is never absent an hour together from the 'Mother Bunch,' where he has a private room much frequented by active, middle-aged persons of a rather seedy cast, and where he takes all his meals at the landlord's table. The first-fruits of these mysterious operations at length appear in the form of a prospectus of a new mutual-assurance society, under the designation of 'The Charitable Chums' Benefit Club;' of which Mr Nogoe, who has undertaken its organisation, is to act as secretary and chairman at the preliminary meetings, and to lend his valuable assistance in getting the society into working order. Under his direction, tens of thousands of the prospectuses are printed, and industriously circulated among the artisans, labourers, small tradesmen, and serving-men in all parts of the town, both far and near. Promises of unheard-of advantages, couched in language of most affectionate sympathy, are addressed to all whom it may concern. The same are repeated again and again in the daily and weekly papers. A public meeting is called, and the names of intending members are enrolled; special meetings follow, held at the large room of the 'Mother Bunch;' the enrolled members are summoned; officers and functionaries are balloted for and appointed; rules and regulations are drawn up, considered, adopted, certified, and printed. Mr Nogoe is confirmed in his double function as secretary and treasurer. Subscriptions flow in; and, to Bowley's infinite gratification, beer and spirits begin to flow out. The Charitable Chums, though eminently provident, are as bibulous as they are benevolent; for every sixpence they invest for the contingencies of the future tense, they imbibe at least half-a-crown for the exigencies of the present. The society soon rises into a condition of astonishing prosperity. The terms being liberal beyond all precedent, the Charitable Chums' becomes wonderfully popular. A guinea a week during sickness, besides medical attendance, and ten pounds at death, or half as much at the death of a wife, are assured for half the amount of subscription payable at the old clubs. The thing is as cheap as dirt. The clerk has as much as he can do to enregister the names of new applicants, and keep accounts of the entrance-money. By way of keeping the society before the public, special meetings are held twice a month, to report progress, and parade the state of the funds. Before the new society is a year old, they have nearly one thousand pounds in hand; and Bowley's house, now known far and wide as the centre and focus of the Charitable Chums, swarms with that provident

brotherhood, who meet by hundreds under the auspices of 'Mother Bunch,' to cultivate sympathy and brotherly love, and to irrigate those delicate plants with libations of Bowley's gin and Bowley's beer. The Free-and-easy is now every night choke full of wide-mouthed harmonists. The 'Concert this Evening' is no longer a mere mythic pretence, but a very substantial and vociferous fact. The old grand-piano, and the old, ragged player, have been cashiered, and sent about their business; and a bran-new Broadwood, presided over by a rattling performer, occupies their place. Bowley's blooming wife, attended by a brace of alcoholic naiads, blossoms beneath the crimson drapery of the bar, and dispenses 'nods and becks, and wreathed smiles,' and 'noggins of mar,' and 'three-outers,' to the votaries of benevolence and 'Mother Bunch;' and the landlord is happy, and in his element, because the world goes well with him.

When Whitsuntide is drawing near, a general meeting of the club is convened, for the purpose of considering the subject of properties. A grand demonstration, with a procession of the members, is resolved upon: it is to come off upon Whit-Monday. In spite of the remonstrance of a mean-spirited Mr Nobody—who proposes that, by way of distinguishing themselves from the rest of the thousand-and-one clubs who will promenade upon that occasion, with music, flags, banners, brass-bands, big drums, sashes, aprons, and white wands, they, the Charitable Chums, shall walk in procession in plain clothes, and save their money till it is wanted—and in spite of five or six sneaking, stingy individuals, so begrudgingly minded as to second his proposition, and who were summarily coughed down as not fit to be heard, the properties were voted; and the majority, highly gratified at having their own way, gave *carte-blanche* to their officers to do what they thought right, and for the credit of the society. Accordingly, flags and banners of portentous size, together with sashes, scarfs, and satin aprons, all inlaid with the crest of the Charitable Chums—an open hand, with a purse of money in it—were manufactured at the order of the secretary, and consigned in magnificent profusion to the care of Mr Bowley, to be in readiness for the grand demonstration. A monster banner, bearing the designation of the society in white letters upon a ground of flame-coloured silk, hung on the morning of the day from the parapet of Bowley's house, and obscured the good 'Mother Bunch,' as she swung upon her hinges, in its fluttering folds. The procession, which went off in irreproachable style, was followed by a dinner at Highbury Barn, at which above a thousand members sat down to table; and after which, thanks were voted to the different officers of the club; and, in addition thereto, a gold snuff-box, with an appropriate inscription, was presented to Mr Nogoe, for his unparalleled exertions in the sacred cause of humanity, as represented by their society.

The jovial Whitsuntide soon passed away, and so did the summer, and the autumn was not long in following; and then came the cold winds, and fogs, and hoar-frost of November. The autumn had been sickly with fevers, and Dr Dosem, the club's medical man, had had more cases of typhus to deal with than he found at all pleasant or profitable, considering the terms upon which he had undertaken the physicking of the Charitable Chums. He was heard to say, that it took a deal of drugs to get the fever out of them; and that, though he worked harder than any horse, he yet lost more of his patients than he had fair reason to expect. With nearly fifteen thousand members, the deaths in the club became alarmingly frequent. Nogoe, as he took snuff out of his gold box, shrugged his shoulders at the rapid disappearance of the funds, as one ten-pound cheque after another was handed over to the disconsolate widows. His uneasiness was not at all alleviated by the reception of a bill of two hundred

and fifty pounds for properties, &c. among which stood his snuff-box, set down at thirty-five guineas, upon which he knew, for he had tried, that no pawnbroker would lend ten pounds. He called a special council of all the officers of the club, and laid the state of affairs before them. The first thing they did, was to pass a vote for the immediate payment of the property bills; a measure which is hardly to be wondered at, if we take into account that they were themselves the creditors. The treasurer handed them a cheque for the amount; and then, apprising them that there was now, with claims daily increasing, less than two hundred pounds in hand, which must of necessity be soon exhausted, demanded their advice. They advised a resumé of prospectuses and advertisements; which being carried into effect at the cost of a hundred pounds, brought a shoal of fresh applicants, with their entrance-money, and for the moment relieved the pressure upon the exchequer.

But when the November fogs brought the influenza, and a hundred of the members were thrown upon their backs and the fund at once; when it became necessary to engage additional medical assistance; and when, in spite of unremitting energy in the departments of prospecting, puffing, and personal canvassing, the money leaked out five times as fast as it came in, then Mr Nogoe began to find his position peculiarly unpleasant, and anything but a bed of roses. With 'fourscore odd' of sick members yet upon the books—with five deaths and three half-deaths unpaid—and the epidemic yet in full force, he beheld an unwholesome December threatening a continuation of sickness and mortality, and a balance at the banker's hardly sufficient to pay his own quarter's salary. Again he calls his colleagues together, and states the deplorable condition of affairs. The representatives of the five deceased members, whom Nogoe has put off from time to time on various ingenious pretences, having become aware of the meeting, burst in upon their deliberations, and after an exchange of no very complimentary remonstrances, backed by vehement demands for immediate payment, are with difficulty induced to withdraw, while the committee enter upon the consideration of their cases. Nogoe produces his budget, from the examination of which it appears, that if they are paid in full, there will remain in the hands of the bankers, to meet the demands of the 'fourscore odd' sick members, the sum of 4s. 7d. What is to be done? is now the question. A specification of three hours, during which every member of the committee is heard in his turn, helps them to no other expedient than that of a subscription for the widows, and a renewed agitation, by means of the press and the bill-sticker, to re-establish the funds by the collection of fresh fees and entrance-money. The subscription, the charge of which is confided to a deputy, authorised to collect voluntary donations from the various lodges about town, turns out a failure: the widows, who want their ten pounds each, disgusted at the offer of a few shillings, flock in a body to the nearest sitting magistrate, and clamorously lay their case before his worship, who gravely informs them, that the Charitable Chums' Benefit Society being duly enrolled according to Act of Parliament, he can render them no assistance, as he is not authorised to interfere with their proceedings.

In the face of this exposure, the agitation for cramming the society down the throats of the public goes on more desperately than ever. By this means, Mr Nogoe manages to hold on till Christmas, and then pocketing his salary, resigns his office in favour of Mr Dunderhead, who has hitherto figured as honorary Vice-Something, and who enters upon office with a gravity becoming the occasion. Under his management, affairs are soon brought to a stand-still. Notwithstanding his profound faith in the capabilities of the Charitable Chums, and

his settled conviction that their immense body must embrace the elements of stability, his whole course is but one rapid descent down to the verge, and headlong over the precipice, of bankruptcy. The dismal announcement of 'no effects,' first breathed in dolorous confidence at the bedsides of the sick, soon takes wind. All the C. C.s in London are aghast and indignant at the news; and the 'Mother Bunch' is nightly assailed by tumultuous crowds of angry members, clamorous for justice and restitution. The good lady who hangs over the doorway, in nowise abashed at the multitude, receives them all with open arms. Indignation is as thirsty as jollity, and to their thirst at least she can administer, if she cannot repair their wrongs. Nogoe has vanished from the locality of the now thriving inn and tavern of his friend Mr Peter Bowley, and in the character of a scapegoat, is gone forth to what point of the compass nobody exactly knows. The last account of him is, that he had gone to the Isle of Man, where he endeavoured to get up a railway on the Exhaustive Principle, but without effect. As for that excellent individual, Bowley, he appears among the diddled and disconsolate Chums in the character of a martyr to their interests. A long arrear of rent is due to him, as well as a lengthy bill for refreshments to the various committees, for which he might, if he chose, attach the properties in his keeping. He acorns such an ungentlemanly act, and freely gives them up; but as nobody knows what to do with them, as, if they were sold, they would not yield a farthing each to the host of members, they remain rolled up in his garret, and are likely to remain till they rot, the sole memorials of a past glory.

The Charitable Chums' Benefit Society has fulfilled its destiny, and answered the end of its creation. It has made the world acquainted with the undeniable merits of 'Mother Bunch,' and encircled that modest matron with a host of bibulous and admiring votaries; it has elevated Bowley from the class of struggling and desponding speculators, to a substantial and influential member of the Licensed Victuallers' Company: it has at once vastly improved the colour of his nose and the aspect of his bank-account; and while he complacently fingers the cash which it has caused to flow in a continual current into his pocket, he looks remarkably well in the character of chief mourner over its untimely fate.

LA ROSIÈRE.

ABOUT twelve miles from Paris is situated the pretty vernal hamlet of Maisons Laftite. It hangs around the Château Laftite—a princely residence, formerly the property and dwelling of the well-known banker of that name, but for many years past in other hands. In front of the château, a broad avenue of greensward strikes straight away through a thick forest, extending many miles across the country; and parallel with the front of the building is an avenue still broader, but not so long—La Grande Allée—wherein the various *fêtes* of the hamlet are celebrated, and which, moreover, forms a principal scene in the following narrative.

Before the Revolution of 1793, the name of Gostillon was familiar as a daily proverb to the people of Maisons. There were three or four branches of the family living in the neighbourhood, and well known as industrious and respectable members of the peasant class. When the earthquake comes, however, the cottage is as much imperiled as the palace; so the events which brought Louis XVI. and Marie Antoinette to the block, and sent panic into every court in Europe, also broke up and dispersed the humble house of Gostillon. In the awful confusion of the times, some were slain upon barricades; some sent hither and thither with the army, to perish in La Vendée or elsewhere; and some fled to seek safety and peace in foreign lands. Thus it came to pass, that at length there were only three females in

Maisons—a widow and her two daughters—bearing the once common name. Mme Veuve Gostillon managed to obtain a living by cultivating a small garden—the flowers and fruit from which she sold in the markets of Paris—and by plying her needle. Her daughters were named Julia and Cecilia, and there was the somewhat remarkable difference of eight years between their ages.

Just as Julia had reached her fourteenth year, and little Cecilia her sixth, a terrible misfortune happened to the industrious widow: a stroke of paralysis deprived her of the use of her limbs, and rendered her unable longer to maintain herself and little family by the labour of her hands. A time of severe distress ensued for this remnant of the once numerous and hearty family of the Gostillons; but it was only for awhile. Julia—shrewd, spirited, and industrious—worked night and day to perform the labour heretofore the portion of her parent, and to liquidate the extraordinary expenses of the poor widow's sad illness, and the derangement consequent thereupon. Steady assiduity seldom fails of success. It was not long before she had the satisfaction of finding matters proceeding in a somewhat straightforward manner—doctor's bills paid; arrears of rent, such as they were, made up; and the little business in flowers, fruit, and needle-work proceeding smoothly and satisfactorily. There is much attractiveness in the virtue and good-behaviour of youth; and Julia, handsome, intelligent, modest, and sweet-tempered, soon became the favourite of all who knew her.

The peasantry of France have, from ancient times, maintained the custom of publicly demonstrating their esteem of any young female member of a community, who, in her progress from childhood to adolescence, or rather to womanhood, may have given evidence of the possession of any unusual amount of amiability and cleverness. Young girls who are deemed worthy of public recognition as examples of virtue and industry, are waited upon by the villagers on a fête-day, led forth, seated on a throne of flowers, crowned with roses, blessed by the *curé*, and presented with the honourable title of *La Rosière*. The custom is graceful and poetical; and the world hardly presents a more charming spectacle—at once so simple and so touching—as the installation of a *rosière* in some sequestered village of France. The associations connected with it are pure and bright enough for a Golden Age. All who take part in the little ceremony are humble people, living by their labour; the queen of the day is queen by reason of her industry and virtue; they who do her such becoming and encouraging homage, old and young, lead lowly and toilsome lives, and yet have the innate grace thus to evince their reverence for the best qualities of human nature. The pageantry of courts, and pompous crowning of kings and queens, grand and splendid as they are, have not such spiritual fragrance as these village queen-makings; soft glimmerings and shinnings-through of the light of a better world—a world with which man, let conventionality disguise him as it may, always has some sympathies.

For three years, the exemplary Julia had continued to support her helpless parent and little sister, when, in accordance with this custom, the good folks of the hamlet determined to shew their appreciation of her estimable qualities at the next fête, by crowning her with roses, and enthroning her with the usual ceremony in the Grande Allée. In the meantime, Victor Colonne, son of the steward of the château, happened to pay a visit to the poor widow's cottage; and thereafter he came again, and again, and again, courting Julia Gostillon.

But Victor and Julia were not made for each other. He was thriftless, idle, dissolute—the small *roué* of the neighbourhood: she was careful, industrious, virtuous. He was good-looking—of a dark, saturnine beauty,

insidiously impressive, like the dangerous charms of a tempter; she was radiant and lustrous with the sweet graces of modesty, innocence, and intelligence. Julia, however, young and susceptible, was for a time pleased with his attentions. Persuasive powers of considerable potency, and personal attractions of no mean sort, were not exerted and prostrated at her feet entirely in vain. Ingenuous, trustful, and inexperienced, she listened to the charmer with a yielding and delighted ear, and was happy as long as she perceived nothing but sincerity and love. It was but for a time, however. The Widow Gostillon liked not her daughter's lover. Of more mature perception, of sharper skill in reading character than her child, she conceived a deep distrust of the airy smile and studied gallantry of Victor Colonne. She took counsel with matrons old and circumspect as herself; made herself acquainted with Victor's history; watched his looks, listened to his words narrowly and scrutinisingly; and, day by day, felt more and more strongly that she liked him not—that there was mischief in his restless eye and soft musical voice. She communicated her fears to Julia, told her the history of her suitor, and bade her be on her guard. Julia was startled and distressed. These suspicions checked the brightness and little glory of her life, and settled wanly and hazily on her soul, like damp breath on a mirror. But they served as points of departure for daily thoughts. Looks and words were watched, and weighed, and pondered over with wistful studiousness; and while Victor believed his conquest to be achieved, his increasing assurance and gradual abandonment of disguise were alienating him from the object of his pursuit. Julia had accompanied him on different occasions to the château; been presented to his father; and had been seen, admired, and kindly spoken to by the Comtesse Meurien and her daughters. Victor had lost no opportunity of strengthening his suit by stimulating her ambition and pride; but it was without avail. Though pleased for a time, she soon discovered that he was cold, heartless, and even dissolute. The intimacy betwixt them was fast relapsing into indifference, and, on her side, into dislike, when a certain *dénouement* of Master Victor's notorious love-makings, accompanied by disgraceful circumstances, determined her to put an end to it, once and for all.

'So you are determined?' exclaimed he with ill-restrained anger, as she repeated her resolve to him for the fourth or fifth time.

'Yes: I will have nothing more to say to you,' replied she firmly.

'Then my father and his reverence the *curé* may lose all hopes of me!' returned he bitterly. 'I have done much ill—I own it: I have won no one's esteem: I have been idle, irregular, profligate. But wherefore? Because I have had no one to care for me. Since my mother died, I have been left to myself, with no kind hand to guide me, no kind tongue to warn me: what wonder that youth should go astray?'

'No one to care for you!' exclaimed Julia, not without a tinge of sarcasm. 'Do not your father and monsieur the *curé* do their utmost for you?'

'The one reproves, and the other prays for me,' said Victor, with a derisive smile; then turning to Julia, with a face in which penitence, respect, and affection were well simulated, he exclaimed: 'but thou, dear Julia, art the sovereign of my soul! in whose hand my fate is placed. It is for you to shape my destiny: will you award me love or perdition? At your bidding, no honourable deed shall be too high to mark my obedience.'

'Then return to Marie Buren, and redeem the promise you made her,' exclaimed Julia warmly.

'Nay, sweet Julia, if my priestess bids me turn away from heaven, I am justified in protesting. Hope is the spring whence good and great works flow. Bid me despair, and you bid me seek ruin.'

'Pooh! pooh!' exclaimed the young girl with contempt. 'I am plain Julia Gostillon, who loves frankness and honour. You have neither one nor other, and so I love you not; and again and again I repeat it, I will have nothing more to say to you.'

Though the persevering Victor continued the colloquy, and exerted himself to the utmost, sparing neither vows nor tears, Julia remained firm. At last, seeing that his case was hopeless, he changed his tone into one of sorrowful resignation—declared that honest frankness was a great virtue, and that it was well they had discovered that their affection was not reciprocal; and, in conclusion, begged the wearied Julia to accompany him that night to the château for the last time, for the purpose of explaining to his father, who might, otherwise be troubled with suspicions, that their courtship was broken off by mutual consent. After much persuasion, Julia consented, and accordingly paid her last visit to the château that same evening.

A few days after this occurrence, the 15th of June arrived, the day of the fête. On the preceding evening, unknown to the good Julia, a score of light-hearted girls were weaving garlands of flowers, and preparing the crown of roses, in the house of neighbour Morelle; in that of neighbour Bontemps another gay party were industriously ornamenting a wooden throne with coverings, hangings, and cushions of brightest-coloured flowers; and half the people of the hamlet were thinking of Julia, and preparing bouquets, pincushions, caps, and various little trifles, to present to her on the morrow.

In due course the morrow came. The summer sun had not risen many hours, when troops of bright-eyed girls, lustrous with rosy cheeks, braided hair, snow-white gowns, and streaming ribbons, went, tripping beneath the trees, towards the cottage of Widow Gostillon. After them came bands of youths and boys, and anon men and matrons, and the elders of the place, till nearly all the little community was gathered round the house. Early as it was, Julia had risen, and was at work. She had had her own pleasant anticipations of the fête—though she had not heard that a *rosière* was to be crowned, much less that the honour was in store for herself—and had intended, by commencing some hours earlier than usual, to have done her work so much the sooner, that she might share the pleasures of the festival day. But all thoughts of work were quickly banished by her eager visitors, who, touched even by the fact, that they had found her busy at the time when all were holiday-making, embraced her, praised her, bade her prepare for coronation, wept, laughed, chatted, clapped their hands, jumped, danced, and made such a bustle, that Widow Gostillon, in some consternation, cried out from her chamber to know what was the matter. And the poor widow wept, too, when she discovered what was going on—wept solemnly in thinking over Julia's fidelity to herself, her industry, cleverness, self-denial, sweetness, and, as a proud mother might, of her beauty. And presently the neighbours brought forth the poor invalid in her chair, and placed her on a pleasant spot beneath the trees, whence she might behold the installation. Then Julia retired with those appointed to be her attendants—her tiring-women, the ladies of her court; and when, some time after, she came forth, blushing and trembling, and with happy tears upon her face, wearing her simple holiday dress of white muslin, ornamented, in charming style, with wreaths of roses, the cries of 'Vive la *rosière*!' might have been heard a long way off.

A little while, and sounds of music and of many voices filled the Grande Allée. The long rows of booths and *marquées*, dancing-rooms, gymnasiums, toy-tables, *bazon* tables, fruit-stalls, &c. &c. were surrounded by busy crowds: all was activity and cheerfulness. In a large open space in the midst, a short distance from the front of the château, the flowery throne, gorgeous

in variety and vividness of colours, was set up on a dais on the greensward. The band of celebrants, with Julia and her train in their midst, advanced. Little Cecilia walked by her sister's side, hand in hand, in proud surprise. Before them, an aged peasant marched solemnly, bareheaded save for his silver hair, carrying the crown destined for Julia; and with him, also bareheaded, the curé. A benediction, accompanied by a prayer that the metaphorical ceremony might have some influence in attracting the youthful people present to the practice and pursuit of virtue, having been uttered by the priest, Julia was handed to the throne, and the crown of roses was placed upon her head by the white-haired veteran. A sweet chorus was then chanted—*Vive, vive la *rosière*!*—in the melodious verses of which the signification of the ceremonial and the praises of the fête-queen were recited.

Thus far matters had proceeded happily, when the attention of the gay party was attracted by the apparition of a commissaire of police, who, marching up with the aspect of a man having important and disagreeable business to perform, exclaimed: '*Eh, bien!* we are merry to-day! Accept my best wishes for your enjoyment. Can you tell me, friends, where I am likely to find a fair *demoiselle*—one Julia, daughter of *Mme* Veuve Gostillon?'

'*Voilà, monsieur!*' cried several, much surprised. 'Our *rosière* is she!'

'Ah, what a fate is mine!' muttered the worthy commissaire, much affected, as he looked at the beautiful and rose-wreathed Julia. 'If I had ten thousand francs, I would give them all to be spared this work: but duty is duty. Courage! all may yet be well. Friends,' continued he, raising his voice, 'excuse me if I interrupt you some few minutes. I would not do it were I not bound to. It will be necessary for *Mlle* Julia to accompany me to her home. I trust we shall not be absent long.' He raised his cap, offered his arm; and Julia, amazed and frightened, descended from her throne, and conducted him to the cottage.

'Pardon, mademoiselle,' said he, when they stood inside; 'I am instructed to search this house.' Julia, puzzled, confounded, bowed assent.

The commissaire proceeded, with a hasty hand, as if he wished to get the work quickly over, to ransack drawers and boxes. Whenever one or the other had been searched in vain, he clapped his hand to his breast and muttered: 'God be thanked!' and appeared as if his mind were in some measure relieved of a burden which oppressed it. At length he arrived at Julia's chamber—here, as elsewhere, drawers and boxes seemed to present no signs of the object sought for: the thanksgivings of the commissaire were frequent; his cheerfulness appeared to be returning. Presently, however, he proceeded to turn out the contents of Julia's little reticule-basket: first came a pocket-handkerchief, on the corners of which flowers had been wrought by Julia's needle. 'Very pretty!' remarked the commissaire. Then appeared a number of slips of rare plants, recently collected. 'Ah! you are a botanist?' said the commissaire.

'They are from the conservatory of the Comte Meurien, at the château: I meant to have planted them to-day,' said Julia.

'Who gave them to you?'

'*Mme* Lavine, the *femme de chambre*.'

'Ah, *diable!* I hope you have nothing else from that château?'

'I have nothing else,' replied Julia, blushing, and somewhat discomposed, as she remembered Victor.

'What is the matter?—why are you agitated?' demanded the commissaire, regarding her fixedly.

'It is nothing,' said poor Julia, much distressed by his stern and scrutinising look.

'Nothing? I fear it is something! Alas! I begin to lose hope.'

'Hope of what?' asked Julia wonderingly.

'Of your innocence!' replied the commissaire sternly.

'Mon Dieu! What do you mean?'

'Ah, restez tranquille, pauvre demoiselle; nous verrons toute-suite.' And with a shrug, he continued his investigation of the contents of the reticule-basket. It contained a great variety of little knick-knacks, which, with much patience, the commissaire turned out and examined, one by one. At length he came to a little parcel, the paper-envelope of which appeared to be part of an old letter, and was thickly covered with writing. It was one of Victor's letters. Julia blushed again.

'What have we here?' demanded the constable.

'I forget what there is inside,' said Julia. 'I hardly knew it was there.'

'Let us see.'

He opened two or three wrappers—the portion of the letter formed the outside one, the others being blank white paper—and there fell out, descending upon the table with a sharp jingle, a pair of gold bracelets, ornamented with pearls and turquoises, a superb coral necklace, and a diamond ring.

'Mademoiselle!' exclaimed the commissaire, whose face appeared to lose all flexibility of expression the moment the discovery was made, presenting now merely the stern, impassible, mechanical look of an officer on duty, 'these are the identical articles for which I have been searching for the last three days. Will you be good enough to change your dress as quickly as possible, and prepare to accompany me to the office of M. Morelle, magistrate of this district?'

At this juncture, the Widow Gostillon was conveyed back to her cottage by some of her neighbours, with little Cecilia by her side. Entering Julia's chamber, her young friends found her in a swoon, from which the commissaire was assiduously endeavouring to recover her. A scene of a most painful character ensued. Without afflicting the reader with a recital of the agonised and indignant protestations of Julia—the anger and affright of Widow Gostillon—the sorrow, sympathy, and amazement of the villagers—suffice it to say, that the commissaire, in the course of the morning, conducted Julia into the presence of the magistrate.

It appears that the articles of bijouterie found in Julia's reticule had been missed from the chamber of M^{lle} Antoinette Meurien the very morning after Julia visited Victor's father at the château. The young lady had seen them on her toilette early the preceding evening, and had not worn them for some days, so that she could not have lost them whilst walking or riding. It was evident they had been abstracted. A search was instantly commenced. The domestics were examined, and their rooms and boxes searched, but without either finding the property or fixing suspicion on any one of them. The police were then apprised of the robbery. The servants of the household underwent a second and official examination, but all earnestly declared their innocence. It being ascertained, however, that Julia had visited the house the night on which the property was lost, an order was issued, commanding that her residence be searched, and that she be brought before the authorities. Among the witnesses who proved Julia's visit to the château was Victor Colonne. In mingled affliction and indignation, he answered the questions put to him, and declared that she who had but lately been the object of his ardent affection was the very soul of honour and purity. A lengthened examination elicited from him that he had conducted Julia to the chamber of M^{lle} Antoinette, for the purpose of shewing her the superb manner in which it was furnished and decorated. She had stepped up to the toilette, he admitted, and had surveyed herself, as was very natural, in the glass, but it was only for a

moment; he was close to her all the time, and indeed they hardly remained in the chamber two minutes: they entered, looked round, and retired, and that was all. It was true, he did not keep his eyes on his companion all the time; but had she taken anything, he could not have failed seeing the act.

A general impression prevailed among the people at the château that Julia was innocent; that it was impossible for one so virtuous and intelligent to commit so disgraceful and rash a theft. Indeed, the tide of suspicion had been fast turning against Victor himself, when it received a new direction by the discovery of the missing articles in Julia's reticule. Another examination ensued, the distracted Julia, as has been stated, being herself brought into the presence of the magistrate. In intense affliction, she declared her innocence: that she knew not how the articles had got into her reticule; she had not put them there; did not know they were there; had, indeed, never touched them at all. The portion of the letter in which they had been wrapped was handed to her, and she was questioned concerning it. 'It was part of a letter,' she said, 'which had been addressed to her by Victor Colonne.' She remembered receiving it; but by what means it came to be applied to its present purpose, she did not at all know. M. Morelle sternly bade her tell the truth, and conceal nothing; it would be better for her. In great agony, she earnestly reiterated what she had said. It was useless; the evidence against her was too strong to be shaken by merely her own denial. Moreover, the commissaire of police, in delivering his evidence, laid much emphasis upon the embarrassment and distress she had evinced whilst he was searching the little basket in which the articles were found.

The case was on the point of being decided against her, when, by what may be termed a providential interposition, the tables were suddenly turned, and she was rescued from the jail, from infamy, and perhaps from death! A young girl, one of the domestics at the château, having examined the portion of the letter which formed a link in the circumstantial evidence, produced from her pocket another fragment, which exactly fitted to the first, and made the letter complete! With much curiosity, and indeed excitement, all listened eagerly to what she had to say. She stated that the fragment she produced, which formed the remainder of the torn letter wrapped round the stolen articles, she had picked up in the garden of the château, where it had been dropped by Victor. Julia's reticule had been left on a seat under a tree; the witness saw Victor open it, and take out a letter. He did not know she was at hand; indeed, could not see her. He tore the letter into two pieces: he appeared agitated. One piece of the letter dropped to the ground, the other he did something with which she could not perceive, and replaced in the reticule. When he was gone, she picked up the fragment which had fallen; and seeing it was part of a love-letter, full of warm protests, &c. she put it into her pocket, intending, she said, to joke him about it. A few minutes more, Julia came by, took up her reticule, and went home, declining Victor's company, though he requested permission to escort her.

Hereupon, Victor was immediately submitted to a severe re-examination. Aghast at the disclosure just made; abashed at the many angry eyes directed towards him; harassed by the searching questions of the magistrate, and the sense of guilt, his assurance and hypocrisy completely deserted him; and, after equivocating and protesting for some time, he sullenly confessed all. Discarded by Julia: he had attempted to effect her ruin!

The good little Julia was almost as much overcome by the overwhelming emotions which now possessed her, as she was at the miserable position in which malignity had so lately placed her. Whilst Victor was

being conveyed to the jail, where he was to suffer the punishment due to his villainy, Julia was conducted home to her now rejoicing parent, amidst the congratulations, caresses, and praises, of troops of friends. The day after her acquittal, the throne was again set up in the Grande Allée, and the ovation to her industry and virtues was completed in triumphant fashion. The Meurien family, feeling deeply the injury she had suffered, gave their presence at her inauguration, and afterwards did many a friendly act for her. She is now as industrious and charming, and as much respected as ever, though no more Julia Gostillon, but Madame Vichel—being the wife of a thriving herbalist of that name. As for Victor, he has not been seen at Maisons since.

RAMBLES IN SEARCH OF WILD-FLOWERS.

EARLY MONTHS OF THE YEAR.

A RAMBLE in search of wild-flowers in January would be pretty much 'labour in vain;' at least so far as that one special object was concerned. I do not mean to say that all nature is dead at that season, for there are mosses, lichens, and fungi to be found in abundance; but flowers, in the ordinary meaning of the word, are not to be found, unless we consider those brilliant frostwork flowers which we sometimes find as such. It was a season unusually cold for Devonshire, when, with a merry party of boys and girls, I sallied forth to see how nature looked decked in her robe of virgin white. Hill and valley were one sheet of 'innocent snow;' and every twig, leaf, and blade of grass; every spray of the furze and heath; and every broad, drooping leaf of that beautiful fern the hart's tongue (*Scolopendrium vulgare*), was coated with hoarfrost, and sparkling in the rosy sunbeams like the flowers in a magic garden. At Sherbrook Lake, where a rivulet of clear water usually flows along the bottom of the ravine down to the sea, there was now a hard mass of ice, on which our boys rushed for a passing slide; and above, where the deeper water lies under the shadow of the brushwood, the frost had been busy performing its frolic feats—

'And see where it has hung th' embroidered banks
With forms so various that no powers of art,
The pencil, or the pen, may trace the scene!
Here glittering turrets rise, upbearing high
(Fantastic misarrangement!) on the roof
Large growth of what may seem the sparkling trees
And shrubs of fairyland. The crystal drops,
That trickle down the branches, fast congealed,
Shoot into pillars of pellucid length,
And prop the pile they but adorned before.
Here grotto within grotto safe defies
The sunbeam; there, embossed and fretted wild,
The growing wonder takes a thousand shapes
Capricious, in which fancy seeks in vain
The likeness of some object seen before.'

From the beautiful beacon cliff—to which we eagerly toil through the snow, and up and down the slippery hill-sides—we behold the sea as still and smiling as in summer, and as clearly reflecting the exquisite blue of the vault above; but each of the many little rills which the long rains preceding the frost had caused to flow over the face of the red cliffs, is now a stationary thread of silver, spell-bound by the enchaining frost; and icicles, or, as old-fashioned people call them, *aglets*, of three or four feet long, ornament the overhanging ledges, prone to fall to the beach—far, far below—when a thaw releases them from their present stations. But

the air is so very keen that nothing but the briskness of our walk, and the enlivenment of an occasional spell of snow-balling, in which the seniors are tempted to join the juniors, prevent our stagnating into 'pellucid pillars' ourselves. So much, then, for our January ramble. The season of which I have now to speak was most different. After unusual cold, especially after snow, it is not uncommon to see an early spring appear, and so it was now, as Spenser says—

'The fields did laugh, the flowers did freshly spring,
The trees did bud, and early blossoms bore;'

and so warm was it one day towards the end of February, and the air so sweet, that I resolved on having 'Jack' and sallying forth in search of wild-flowers—not flowers of frostwork, but real spring jewels.

On this excursion, I thought it expedient to take Fanny, which, though a somewhat stubborn little beast of burden; yet so bent was I on seeing the sweet spring-like hedges and banks, that I agreed to endure Fanny; and at the given time on her I mounted, and after much persuasion, got her under-weight: the boy George bringing up the rear.

And now on we go, Fanny rather tiresome, and George rather merciless; for when she will poke her head into the hedge, and stand stock-still to eat, or, worse still, suddenly push up against a stone-wall, to the imminent danger of crushing my foot to pieces, he thumps and pushes her till the echoes in Echo Lane reverberate with the unpoetical sound. However, on we go by degrees, and find the banks everywhere rich with fresh springing grass and deep full beds of moss, with every here and there the pale lemon-tinted petals of the primrose just peeping through the partial openings in their shrouding mantles of green; and there, above us, hangs that which I had hoped to find—the catkins of the hazel, which have been hailed by children for centuries under the names of 'Pussy-cat's tails,' or 'Baa-lamb's tails;' and a more interesting flower for examination as we pass onwards we can scarcely have, for its structure is very peculiar and beautiful. We will gather a good bunch of these pretty pendent tassel-like clusters; and see! as we break off the stems, what a shower of gold-dust is scattered over us, and flies in all directions through the air! So abundant is this yellow pollen beneath the scales of the catkins, that we shall find, if we place them in our moss-basket, that the table below them will be coated with it in the course of an hour or two. The common hazel or nut-tree affords a fine illustration of the structure of that division of plants to which most of our common European trees belong, and which, from its including the oak, is called 'the oak-tribe.' I shall not, however, expatiate on the hazel, the pride of our old copse-banks, but look beneath its long slender branches, and there, lurking modestly, do I see that pretty little yellow flower, the lesser celandine (*Ficaria verna*). Every one knows this little early blossom by sight, if not by name. Its root is formed of numerous clustering tubercles, or oblong knobs, with fibres. This root is sometimes washed by the rain until these tubercles appear above ground, when, as London tells us, 'ignorant people have sometimes been led to fancy that it rained wheat.' The celandine has slightly-branched stems, two or three inches in height, on which grow alternate stalked heart-shaped leaves, sheathed at the base, where they sometimes contain one or two knobs like those of the root. The flowers, which are terminal and solitary, are much like a butter-cup—of a golden yellow, and exceedingly shining within, and tinged with green on the outsides. 'After the flowre decays,' says Gerard,

'there springeth up a little fine knop or headful of seede.' This head of seed alone is left by about May to mark where the plant grew; and even this soon dries up and disappears. Wordsworth has thrown an interest about this plant, which it would not otherwise have possessed, by his elegant little poem called *The Lesser Celandine*.

Here and there, also, in the more sheltered spots, we find a blossom or two of the pretty pink herb Robert (*Geranium Robertianum*), with its hairy red stems, and divided leaves, and star-shaped blossoms of bright rose-colour; or an early plant of the ground-ivy (*Glechōma hederacea*) gemming the ground with its purple, lobate flowers on the sunny bank beneath the underwood, luring one for a moment to believe that the sweet purple violets were already come: vain hope! which not only the season but the place forbids; for though I have found white violets near the scene of these excursions, in the south of England, yet I believe the sweet-scented purple do not grow in that neighbourhood. In a late ramble, there was a spot which I was eager to reach; for there I knew that I should find

'Chaste snow-drop, venturous harbinger of spring,
And pensive monitor of fleeting years.'

This pretty well-known flower, sometimes called Fair Maid of February (*Galanthus Nivalis*), belongs to the same natural order as the daffodil and narcissus—the *Amaryllideæ*. Gerard calls it 'the timely flourishing bulbous violet,' and thus graphically describes it: 'It riseth out of the ground,' says he, 'with two small leaves flat and crested, of an overworne greene colour, betweene the which riseth up a small and tender stalk of two hands high; at the top whereof cometh forth of a skinny hood a small white floure of the bignesse of a violet compact of six leaves, three bigger and three lesser, tipped at the points with a light greene; the smaller one fashioned into the vulgar forme of a heart, and prettily edged about with greene; the other three leaves are longer and sharp-pointed. The whole floure hangeth downe his head by reason of the weak footstalk whereon it groweth. The root is small, white, and bulbous.' It is one of the earliest flowers which appear, and may often be seen bursting through the snow, the virgin white of its petals by no means shamed by the lustrous purity of its cold bed. It has no calyx; six stamens; the filaments short and hair-like; the anthers oblong, with a bristly point, and one pistil, the style being cylindrical, and longer than the stamens. The capsule, which is nearly globular, contains three cells, in which are numerous globular seeds. It is found in orchards, meadows, and the sides of hedges, and named from two Greek words signifying 'milk' and 'a flower.'

And now we reach the orchard: but how am I to get in? There is nothing for it but a scramble up that bank round the root of that old oak, whose gnarled boles will afford me footing, and it will be easy to descend on the other side; and so, with a few slips, I contrived to land in safety among the long, tangled grass, and broken branches of apple-trees, richly clothed with lichens, mosses, and fungi, in a spot which looked as if untrodden by human foot for years. But that could not really have been so, for no doubt the old trees had borne their usual crop of ruddy apples, which had been duly housed. The value of an apple-orchard in Devonshire—that land of delicious cider—is not a trifle, and our farmers do not leave their orchards untrodden and uncared-for. This was, however, sufficiently wild. But now for my snow-drops: there they wave in thousands—

'Like pendent flakes of vegetating snow—
The early heralds of the infant year—'

in every stage of beauty, from the hint that a tiny

spot of green and white, bursting through the dark earth, might give, to the fully-developed blossoms, hanging lightly on its graceful stalks, robed in its vestal garb of white, and shedding its own peculiar fragrance on the pure air. I gathered large supplies—enough to make me the envy of all the lovers of spring-flowers whom I met; enough to fill my moss-basket, and vases, and glasses without end for myself; and enough to send a feeling of spring brightness and joy into the hearts of two or three invalids, to whose sick-rooms I sent some of these pretty messengers.

Somewhat dragged with the wet grass, and muddled with the slippery hedge-bank, I at last returned to the lane where I had left Fanny. However, there was no one but George to notice my appearance, and he was too much taken up with the basket of fine roots which he had procured (be sure always to take a trowel and basket with you on such expeditions), to care how I looked; and, besides, as 'no man is a hero to his valet,' so no lady is a fine lady to her donkey-boy; and homewards we turned, threading our way between the over-arching trees, not as yet shewing sign of leaf; but their richly-tinted bark, varied by mosses and lichens of different hues, and partly mantled with ivy, now in full berry, looked almost as beautiful, as the sunbeams fell on them, and the blue sky shone between, as they do in their summer verdure.

On we jogged, Fanny well pleased to be on her homeward course; until at last, coming to a cross-way which would have either led us straight home or taken us thither by a little circuit, I, lured by the desire of seeing whether the daffodils began to shew blossom, resolved on the latter road, not duly considering that perhaps she had decided on the former. But so it was; and, notwithstanding sundry stripes, her will remained unsubdued, as she presently evinced. After we had gone a little way up a lovely sunny lane—slowly indeed, for she was evidently as perverse as she could be, yet with much enjoyment on my part—I was gazing upwards at some delicate white clouds, which a light breeze wafted across the face of the sky, or watching some bird in its flight, when suddenly I felt the jogging onwards cease, a slight undulating motion, and found that my feet were on the ground. Fanny had lain down in the dust, and I had but to rise as I would from a low chair to be standing quietly by her side. George dared to grin, and there were two or three country-people who happened to be passing at the time, who were convulsed with laughter at my expense—a laughter in which I could not but heartily join. How much has fancy to do with such things! How grand is the idea of a camel or an elephant meekly kneeling down to receive or deposit its load! how dignified I should have felt had I thus descended from one of those noble animals! whilst this mode of being deposited by a poor little donkey made us all laugh! Truly, 'there is but a step between the sublime and the ridiculous,' and my adventure certainly smacked of the latter. But Fanny had conquered; and, as if with one stroke to confirm her victory, and to rejoice over it, she suddenly turned over on her back, cracked the girths of the old saddle, and rolled over and over in the dust with all four legs up in the air. This was too much for endurance; so, leaving George to readjust the saddle as best he might, and bring home our basket of spoils, I turned back, and sauntered homewards with my bunch of 'timely-flouring bulbous violets' in my hand. At Kersbrook I discovered a new treasure—one which, however, I afterwards found to be common, although it was then unknown to me—and it was some time before I could make out what it was. I took it for a saxifrage, but could find nothing under that head which exactly answered to it. It was, I at last discovered, the golden saxifrage (*Chrysosplenium oppositifolium*) or opposite-leaved scungreen, nearly allied to the saxifrage, and of

the natural order saxifrage, but not one of them. I found it fringing the side of the brook between the wall and the water. It grows about four or five inches high, with branched stems bearing very succulent, kidney-shaped leaves opposite each other—the radicle leaves on long foot-stalks, whilst those of the stem-leaves are much shorter. The flowers, which are of a bright greenish-yellow, grow in small umbels; and the whole plant has a yellowish hue. The uppermost flower in general bears ten stamens, whilst the next boasts of but eight each. Its capsules are two-beaked, one-celled, and two-valved, the seeds numerous and roundish. It is named from *chrysol*, 'gold,' and *splen*, 'the spleen.' There is another specimen much like this, of which I have spoken, *Chrysosplenium alternifolium*; but it is larger, handsomer, and less common. In the Vosges this plant is much used—as our own water-cress is in England—for a salad, under the name of *Cresson de Roche*. There is a little flower, elegant and singular in appearance, though, as its name indicates, not one of much splendour, which resembles the golden saxifrage, in the peculiarity of having a different number of stamens in its crowning floret from those of the lower ones: this is the green moschatel (*Adoxa moschatellina*), *adox* signifying 'inglorious.' The flowers are pale-green, in a terminal head of five florets, the upper of which is four-cleft, and has eight stamens, the other being five-cleft, with ten stamens in each. Its fragile stem and delicate compound leaves, and the early season at which its blossoms, give attraction to this little plant, and make it a favourite with me. The butter-cups are not yet in bloom; but the daisies! Oh, what store of daisies is on every bank and in every field, and what troops of baby children, with their little baskets, sitting on the green turf and picking them! I do love the daisy; and indeed I much fear that I should have been found taking part with that 'merry troop' of 'ladies decked with daisies on the plain,' of which we read in Dryden's elegant fable of *The Flower and the Leaf*, rather than with those wiser and more renowned who 'chose the leaf':—

'A tuft of daisies on a flowery lay
They saw; and thitherward they bent their way;
To this both knights and dames their homage made,
And due obeisance to the daisy paid.
And then the band of flutes began to play,
To which a lady sung a virelay:
And still at every close she would repeat
The burden of the song—"the daisy is so sweet."'

The structure of the daisy has been noticed in a former paper, and its appearance needs no description. But there is one other flower which I meet with that must not escape us, and that is that noble plant, the butter-bur (*Tussilago petasites*), named from a Greek word signifying a broad covering. Its leaves, the largest produced by any British plant, are sometimes from two to three feet across, and form a shelter for poultry and small animals from the rain. It is a composite flower of the sub-order *Tubulifloræ*. The large club-shaped bunch of flower comes before the leaves are more than partially developed, and are of a pale-purple tint, and of a most delicious fragrance, not unlike the heliotrope. When these die off, the magnificent leaves form quite a beautiful object in the landscape. Artists are fond of introducing them into the foreground of their sketches, and very ornamental they are; but they should be careful not to place them where nature never designed they should grow, among dry hill and rock scenery, or on the sea-coast—for they are only to be found growing in moist and shadowed places, and usually in the vicinity of a brook, to which they form a very apposite adornment.—But here we are at home, and there stands Fanny at my door with her load of treasure, George having trotted her home by a

shorter cut than that which I had followed; and unless Jack or Sam can honour me with their company the next time I go flower-picking, I shall surely, as the Scotch say, 'ride upon shanks naiggie.'

AN EVENING IN WESTMINSTER.

IN a drizzly afternoon at the close of January, we met by appointment at a house in Westminster with a gentleman, who had kindly undertaken to introduce us to a very remarkable institution in that part of the metropolis. A walk of a few minutes through the flashy streets brought us to a wide gateway, like the entrance to a brassfounder's yard. We soon found ourselves in a narrow court, encumbered with building materials and surrounded with plain brick structures, which appeared to have either been recently erected, or to be undergoing some changes designed to adapt them to new purposes. Everything looked plain and homely, even to rudeness; but we, nevertheless, knew well that a heart of humanity and noble intention beat under the rough exterior of the place.

Rather less than four years ago, the teacher of a ragged school in Westminster encountered, in the course of his professional exertions, three or four boys who had hitherto been thieves, but now expressed a desire to leave their evil courses. Having some reason to repose faith in their professions, and being humbly anxious to assist them in so good a purpose, he received them into a poor garret-lodging, hired and paid for out of his own resources. He supported them there, taught and trained them, making himself their friend as well as their mentor, and in time he succeeded in getting them passages to America, where they have since prospered. Mr Nash—for such is the name of this philanthropist of humble life—continued his benevolent exertions and sacrifices, till various gentlemen, hearing of what he was doing, came to his assistance. A little money being then collected, it was found possible to take in a greater number of boys. In short, Mr Nash became the head of a little institution for the reclaiming of criminal and vagrant youths, which has finally become located in the yard we have described, under the name of the London Colonial Training Institution and Ragged Dormitory. It is still a kind of family arrangement of Mr Nash's own, taking its character mainly from his benevolent and self-sacrificing efforts, although drawing pecuniary support from the public, and ostensibly graced with a list of honorary office-bearers, with the Earl of Shaftesbury at their head.

There is a prepossessing simplicity in the whole affair. We found the ground-floor of the new building used as a school and public room, and the two upper floors as dormitories—nothing but brick walls whitened, brick and deal floors—no luxury, but cleanliness and good ventilation. The beds were mere bags of straw laid on the floor. Three plain meals per day are given. The strictest regulations are maintained; but there is no restraint. The inmates can leave the institution if they please. Their coming is entirely voluntary; and, to make sure of their being thoroughly in earnest, they are not admitted to the humble privileges of the place, till they have lived a fortnight upon a pound of bread a day, sleeping all the time upon bare boards. In the outer buildings, the boys are trained to carpentry, tailoring, and shoemaking. A few are instructed in printing: in their little office, we found one ordinary press, besides a small one for taking proofs. They can

execute shop-bills and placards for the tradesmen in the neighbourhood, and we received a copy of an annual report which had been printed very neatly by them. In work, schooling, religious exercises, and walks out of doors on the ordinary days of the week, the time passes usefully and not disagreeably. At the end of a year, they are, if not provided with employment at home, sent to some of the colonies with a small outfit, generally at the expense of some benevolent individual. Lord Shaftesbury has been particularly liberal in furnishing means for their shipment. The inmates feel that they may now have a hope in the world. They hear of companions who are prospering in America, and they work cheerfully on in the faith of getting there also. Very few fail in their course, or act dishonestly towards the institution. When one or two lately left it, taking away things not belonging to them, the others set out in search of them, caught them, and handed them over to the police. This shews how their hearts are interested in the institution. They feel that Mr Nash acts towards them in pure kindness, and they are anxious to make a suitable return. And kindness really is the sole principle at work in the place. One good man rules these sixty outcasts of society without guard or assistance; without the use of punishment, beyond a temporary restriction of meals; without, it may be said, any force whatever, but that of his benevolent intentions.

At the time of our visit, the establishment contained about sixty inmates. We felt a peculiar interest in visiting the room of probation. There had been four youths in it in the morning; but one had withdrawn, not being able to stand the severity of the test. The three remaining youths stood up in their wretched attire, and we questioned them in succession. They had all been thieves, and all of them had passed through several convictions—one through no less than twenty-two. We asked this last youth how he had come to think of retreating to the Colonial Training-School. He said, that he knew he could not go on much longer without being transported: he dreaded this fate. Some companions who had been in the school, but deserted it, told him of it. They praised the institution, as one where every kindness was shewn to unfortunate youths, notwithstanding that they had themselves proved unworthy of its benefits. He therefore came, determined to suffer whatever might be inflicted upon him, rather than go back to his wicked courses. We learned that he had been for several years a pickpocket, residing in a low lodging-house at 1s. 9d. a week; sometimes well off, sometimes otherwise, but always harassed by the terrors of punishment. According to his account of the boys who live in this manner, there are some who enjoy its freedom, and would not abandon it; but there are many who would much rather turn from it, if an opportunity were afforded them. We afterwards spent some time in the school-room amongst the boys; heard them sing a hymn, and, at the request of the governor, addressed a few words to them, chiefly suggestive of hope respecting their future career. During the whole time, their behaviour was marked by perfect propriety; we did not observe even an indecorous look in the whole company.

We bade adieu to Mr Nash, with a deep sense of his heroic philanthropy, and of the value of the lesson which he is giving as to the means of reclaiming the desert places of society. As far as the funds supplied to him permit, he is transforming the juvenile delinquents of the London streets into respectable citizens, having already redeemed a hundred and fifty-six, and either provided for them in England, or despatched

them to the colonies. One may well suppose, that in the process of reformation much must depend upon the special character of the person who exercises the reforming discipline. A mere routine of school exercises, of scripture readings, of hymn singing, would go little way with minds so vitiated by bad habits, if there were not a particular effort made by the disciplinarian to make all work thoroughly into the moral nature of the pupils, so as to produce a real renewal of feeling and spirit. Even to rouse the unfortunate being from the idea with which he is apt to start, that he is only called upon to enter on a new career which will be better for him in a worldly point of view, and to elevate him to the superior and only vitally serviceable idea, that he must love goodness for its own sake, and for the love of the Author of all goodness, is no light task. We can, therefore, imagine scarcely any position calling for a more peculiar combination of qualities than that of the conductor of this extraordinary seminary. It is a strong testimony to the suitability of Mr Nash for his functions, that they were entered upon under the impulse of his own mind. We have further proof of it in the good effects of his teaching, for the histories of many young men who have passed through his hands can be traced from authentic documents. One who emigrated to the United States so lately as March 1850, already reports that he is earning there L.3, 12s. per week, and has just married a young woman who had saved 800 dollars; another of his pupils is now acting as a missionary in Australia. They write to their former governor in the most grateful terms, and with strong expressions of hope regarding their own future. It is interesting to think of all this good being done by individual exertion and self-devotion. No government interferes: there is no certain fund to be depended on. A simple MAN, sensible of humane obligations towards the unfortunate, comes forward and puts himself in direct intercourse with them. They might mistake the views of a government, or of a set of parish authorities; they might lean unduly upon any formally-appointed fund. They cannot mistake the designs of a mere human being like themselves, or become spoiled by indulgence in so poor a retreat. The gratitude due by society to such a man is incalculable.

It is gratifying to think that Mr Nash does not stand alone in his disinterested course. There is a Mr Ellis, a shoemaker in Albany Street, Regent's Park, who, under the impulse of religious feeling for the unfortunate, has taken a number of delinquents into his care, with a view to reforming them. Four years ago, he began with two, to whom he assigned certain rations. The first movement was an act of self-denial on their part. In order to secure the admission of a companion, who could not otherwise have been provided for, they agreed that their rations should be divided with him; and on these terms he was admitted. Soon after, the number was increased to fifteen; and with this number Mr Ellis has gone on most successfully. The boys have been industrious, and only one has been guilty of any offence. The prosperous man of the world, who thinks himself entitled to use all his own for his own sole gratification, will hear of these things with incredulity, and pity Ellis and Nash as enthusiasts, who foolishly sacrifice themselves for a whim; but we greatly doubt if the worldling's proudest or most luxurious hour gives one-half the true satisfaction which these men enjoy in the midst of their ragged adherents, under the blessed hope of rescuing them from destruction in this world and the next.

The subject of juvenile delinquency is beginning to attract a good deal of attention, for it is now clearly seen that the root of most of the predatory crime by which the country is afflicted lies here, and till the root is struck at, the branches will continue to flourish. It appears that for some years the number

of juvenile criminals has been on the increase; auguring, of course, an ultimate increase in the number of adult offenders. Some vigorous measure for the reduction of juvenile delinquency is felt to be now required. Amidst all the alarms which it is exciting, and amidst the expressions of hopelessness which we often hear from those who give little attention to the subject, it is gratifying to find, that there are some glimpses of what appears to be the right course to be taken. First, one great point is very clearly established—that it really is possible to reclaim juvenile criminals. It cannot, however, be done by punishments of any kind. It is to be done by kindness, religious influence, and industrial occupation, along with the holding forth of a hope of transition into a better course of life. Those who may be incredulous on this point, had better acquaint themselves with the facts of the case. It is too little known, that there has been a society at work for the last sixty years in England, for the reform of juvenile offenders. It has a farm at Red Hill, near Reigate, from which about forty youths go out every year to agricultural labour and humble trades, in which the great bulk of them do well. The similar institution at Mettray, near Tours, produces similar results on a greater scale. And the simple truth at the bottom of the whole affair is, that young thieves are, in general, deserted or orphan children, or children driven forth to destitution by vicious parents: criminal through circumstances, and finding no true happiness in their wicked kind of life, a large proportion of them *desire to reform*, and will suffer not a little in order to obtain admission to respectable society.

It has lately been shewn, that society has a strong interest of a pecuniary nature in the reformation of juvenile delinquents. A boy or youth continually going about as a pickpocket or petty larcenist, is a destructive animal of somewhat formidable character. To get quit of him at last by transportation, costs at the least calculation £150. Now, he can be put through the twelvemonth's course of reformation in such a school as that which we have described, and deported as a free emigrant to Australia (where he is welcomed), for £25. Thus, even in an economical light, the reforming of the youth is a great gain. Magistrates are everywhere impressed with the hopelessness of a mere judicial treatment of these hapless children. They come back to the dock at almost regular intervals; severity is of no avail with a poor wretch who, on being discharged from jail, finds all honest employment denied to him. It is by reform alone that we can rid ourselves of this moral pest, by which our country is disgraced.

There is but one difficulty in the case, and that is one involving profound social questions. Shall we see criminal children taken care of, and treated kindly, while many of the children of the honest poor are so ill off? Shall we not, by taking these children under our care, and so relieving parents and others of their responsibility towards them, sap the principles of the industrious poor, leading them to desert or cast off their children, whom they will now be sure of seeing cared for by others? We must admit that there is much force in these queries; but it would be wrong to allow them altogether to deter us, where the reasons on the other side are so urgent. It may be possible, by keeping to such individual efforts as those of Mr Nash, or to those of little unobtrusive societies, to prevent much of the evil apprehended. And it may also be practicable, as we find is proposed, to arrange that there shall be a legal claim upon parents for the expenses incurred in reforming their criminal offspring. Thus none who are not themselves destitute, could safely leave their children to the chances of a criminal life. It is also most desirable, that the state should limit its interference to grants of money in proportion to the sums advanced by private or local effort, and to the enforcing of a law for the detention of vagrant and criminal children

where it may be necessary. Under such precautions, we think most of the advantages might be obtained, with a much less admixture of evil than many would now be disposed to expect.*

'MEN OF THE TIME.'

A NEAT little volume, well filled with information, has made its appearance under this title;† the object being to present sketches of living notables—men who, in their several walks of life, tread in advance of the general multitude in this and other countries; and from whose actions we may learn the character and aims of the passing era. The idea of gathering together materials of this kind, and laying the result in an accessible form before the public, is a good one. All will depend, however, on the manner of execution. The attempt before us, being the first of its kind, is perhaps necessarily imperfect, and we may expect some improvements should the work realise the expectations of its publisher. For example, we miss the names of various men of note, to whom England owes many acknowledgments—such as Dr Neill Arnott, Mr Edwin Chadwick, Archibald Alison, &c.—and in several instances, also, the sketches actually given are very deficient in attainable facts; while there occur notices of individuals whose names can scarcely be said to be known to the public. With these imperfections, the work is a handy biographic compendium, full of amusing particulars, that cannot fail to be useful in the way of reference. To provincial libraries, the book will be a cheap and agreeable accession. As a specimen of the manner of execution, we present the following scraps of quotation:—

'Brooke, Rajah Sir James, is a Somersetshire man, born on the 29th of April 1803, at Combe Grove, near Bath. His father was engaged in the civil service of the East India Company; and when of sufficient age, the future rajah was sent to India as a cadet, and, on the Burmese war breaking out, went to the scene of operations; entered upon active military service; and whilst storming a stockade, received a bullet in his chest. This wound kept him for awhile balanced between life and death, but a strong constitution stood him in good stead, and he was able to reach England on furlough, to seek the full restoration of his health. When sufficiently strong, he set out on a tour through France, Switzerland, and Italy, the languages, as well as manners and condition of which he studied; but the longest leave of absence will expire at last, and we find our hero, in due course, again setting out for the East; failing, however, to reach it at once, for the ship in which he sailed was wrecked on the Isle of Wight. In his next vessel, he was more fortunate, and safely reached India, to resume his duties; but finding a long official correspondence requisite to explain why a shipwreck should have delayed an officer's return, he resigned the service of the East India Company, and in 1830 sailed from Calcutta for China. "In this voyage," says Captain Keppel, in his *Expedition to Borneo*, "while going up the China seas, he saw for the first time the islands of the Asiatic Archipelago—lands of vast importance and unparalleled beauty—lying neglected and almost unknown. He inquired and read, and became convinced that Borneo and the Eastern Isles afforded an open field for enterprise and research. To carry to the Malay races, so long the terror of the European merchant-vessel, the blessings of civilisation, to suppress piracy, and extirpate the slave-trade, became his humane and generous objects;

* The reader will find excellent matter on this subject in Mary Carpenter's recent volume on Reformatory Schools, and in a 'Report of the Proceedings of a Conference on the Subject of Preventive and Reformatory Schools, held at Birmingham on the 9th and 10th of December 1851.'

† Bogue, London: 1852.

and from that hour the energies of his powerful mind were devoted to this one pursuit. Often foiled—often disappointed, with a perseverance and enthusiasm which defied all obstacle, he was not until 1838 enabled to set sail from England on his darling project.” Having procured and manned a yacht, he set out on his expedition to the Eastern seas, in spite of all sarcasms from croakers; and ‘when the news came home that he had truly engaged in the suppression of the Malay sea-robbers, and had been rewarded by the cession to him, by a grateful native prince, of the territory and governorship of Sarawak—a tract embracing about 3000 square miles of country, with a sea-board of about fifty miles—said croakers began to think the adventurous undertaking not so wild after all. The steps by which he became rajah of Sarawak may be here recounted. When in his vessel, the *Royalist*, he reached the coast of that country, he found its ruler engaged in the suppression of one of the rebellions frequent in uncivilised regions. His aid was solicited by the Rajah Muda Hassim, and that aid being given, secured the triumph of the authorities. Muda being soon afterwards called by the sultan to the post of prime-minister, suggested the making the English captain his successor at Sarawak—a step eventually taken. The newly-acquired territory was swampy and ill cultivated by the native Dyaks, who varied their occupations, as tillers of the land, by excursions amongst neighbouring villages, in search of heads. To rob the native of a neighbouring town of his cranium, was regarded in much the same light as the capture of a scalp would be amongst North American savages. Brooke saw at once that no improvement could arise whilst murder was regarded not only as a pleasant amusement, but to some extent as a religious duty. He declared head-hunting a crime punishable by death to the offender. With some trouble and much risk he succeeded to a great extent in effecting a reform. Attacking at the same time another custom of the country—that of piracy—he acted with such vigour, that a class of well-meaning people at home, stimulated to some extent by the private enemies of Brooke, accused him of wholesale butchery. The fact that the destruction of pirates was rewarded by the English executive by the payment of what was called “head-money,” justly increased the outcry. To kill one pirate entitled the crew of a ship-of-war to a certain prize in money—to kill a thousand, entitled them to a thousand times the amount. This premium on blood was wrong in principle, and the result of a wholesale slaughter of Eastern pirates by order of Brooke, led to the very proper abolition of the custom of paying this “head-money.” The men who are entitled to the praise of securing this amelioration of our naval system were not, however, content with the triumph of the just portion of their case; they sought to brand the rajah as a cruel and greedy adventurer—in which attempt they fortunately failed. It is surely unjust to test the acts of a man living and ruling amongst savages by the strict usages of action acknowledged and found most proper for guidance in civilised communities. When, after his first appointment, Rajah Brooke returned to see his friends and to take counsel in England, he was welcomed very warmly. He was made Knight of the Bath; invited to dine with the Queen; found his portrait in the print-shops, and his biography in the magazines and newspapers. The government recognised his position; ordered a man-of-war to take him to the seat of his new settlement; gave him the title of Governor of Labuan, with a salary of £2000 a year, with an extra £500 a year as a consular agent, and afforded him the services of a deputy-governor, also on a good salary—the hope being that the result of all this would be the opening of a new emporium for British trade.’ To this notice might be added an

expression of deep regret that there should be any controversy as to the real nature of Sir James Brooke’s operations in the East. This scandal ought surely to be put an end to by some distinct investigation and avowal one way or the other.

The above notice of Sir James Brooke naturally suggests a recollection of his relentless accuser, Joseph Hume, and we turn up the account of that personage.

‘Hume, Joseph, a Radical Reformer, whose history adds another memorable example of perseverance raising its possessor from a humble station to distinction. He was born at Montrose, in the year 1777. While he was still young, his father, the master of a small trading-vessel of that port, died, leaving his widow to bring up a numerous family. Mrs Hume, it is related, maintained herself and her children by means of a small earthenware business, and placed Joseph in a school of the town, where he received an education which included instruction in the elements of Latin. With such scanty stores of knowledge, he was apprenticed to a surgeon of Montrose, with whom he served three years. Having attended the prescribed lectures to the medical classes in the university of Edinburgh, he was admitted, in 1796, a member of the College of Surgeons in that city. India was at that time a favourite, and, indeed, almost the only field for the young who had no other fortune than their talents and enterprise. To India, accordingly, Mr Hume went, and entered as a surgeon the naval service of the East India Company. He had not been there three years, before he was placed on the medical establishment of Bengal. Here, while increasing his professional reputation, he had the opportunity of watching the whole operation of the machinery of the Company’s service. His quick eye soon detected the deficiencies of the greater number of the Company’s servants in command of the native language, an acquirement so valuable in possessions such as ours. He determined to acquire a knowledge of the dialects of India, not doubting that a sphere of larger utility and greater emolument would open before his efforts. The Mahratta war breaking out in 1803, Mr Hume was attached to Major-general Powell’s division, and accompanied it on its march from Allahabad into Bundelcund. The want of interpreters was now felt, as Hume had expected, and the commander was glad to find among his surgeons a man capable of supplying the deficiency. He continued to discharge his new duties without resigning his medical appointment, and managed to combine with both the offices of pay-master and post-master of the troops. His ability to hold direct intercourse with the natives continued to be of immense service to him, and enabled him to hold simultaneously a number of offices with most varied duties, such as nothing but an unwearied frame and an extraordinary capacity could have enabled any one person to discharge. At the conclusion of the peace, he returned to the presidency, richer by many golden speculations, for which a period of war never fails to offer opportunities. In 1808, having accomplished the object for which he left his native land, he came to England, and, after an interval of repose, determined upon making a tour of the country, the better to acquaint himself with the condition of its inhabitants.’ After making this tour, and visiting various continental countries, he returned to England, where he devoted himself to a political career; and since 1812, he has for the most part had a seat in the House of Commons. His parliamentary history since 1818 has been that of a reformer of abuses and enemy of monopoly, and he is respected even by those who differ from him in opinion.

Our next specimen is—

‘Thackeray, William Makepeace, author, was born in India, in 1811. He is of good family, and was originally intended for the bar, of which he is now a member. He kept seven or eight terms at Cambridge,

but left the university without taking a degree, for the purpose of becoming an artist. After about three years' desultory practice, he devoted himself to literature, abandoning the design of making a position as a painter, and only employed his pictorial talents in illustration of his own writings. For a short time, he conducted a literary and artistic review, similar in plan to the *Athenæum*; but the new journal, although characterised by great ability, perished in competition with established rivals. He also, with the assistance of Dr Maginn, started a newspaper; but this was unsuccessful. His first distinction was won as a writer in *Fraser's Magazine*, *Punch*, and other periodicals of character. In the latter amusing periodical appeared his *Jeames's Diary*, a clever satire on the follies of the railway mania, exposing the hollow foundation upon which railway fortunes and reputations were made. His *Snob Papers*, published in the same manner, have since been collected and reprinted with great success. His satire is as keen as that of Fielding. His *Paris Sketch-Book* appeared in 1840. His *Irish Sketch-Book*, with numerous engravings drawn by the author, was published in 1845. In the next year, appeared his *Notes of a Journey from Cornhill to Grand Cairo*; and in 1847, the first numbers of *Vanity Fair* appeared, in the proper name of their author. This, Thackeray's first fully-developed novel, has been followed by *Arthur Pendennis*, completed in 1851. His Christmas-book, entitled *The Kickshaws on the Rhine*, was attacked by a writer in the *Times*; whereupon Mr Thackeray replied, in a very unmistakable way, in a preface to the second edition of the work. The critic fared very badly in the contest. The charge made against Mr Thackeray is, that he abuses the characters of the literary class with a view apparently of catering to public prejudice. We believe that any such imputation is entirely unfounded; and that Mr Thackeray's observations on the infirmities of authors are due to an honest exposition of his subject. Mr Thackeray has lately imparted much delight by delivering lectures on the literary personages of last century; and in this very act has gracefully raised the public estimation of living authorcraft.

We may extract the following passages respecting the early career of Mr Dickens:—

'Dickens, Charles, the most popular writer of his time, was born in February 1812, at Landport, Portsmouth. His father, the late Mr John Dickens, in the earlier part of his life, enjoyed a post in the Navy Pay Department, the duties of which required that he should reside from time to time in different seaports: now at Plymouth, now at Portsmouth, and then at Sheerness. "In the glorious days" of the war with France, these towns were full of life, bustle, and character; and the father of "Boz" was at times fond of dilating upon the strange scenes he had witnessed. One of his stories described a sitting-room he once enjoyed at Blue-town, Sheerness, abutting on the theatre. Of an evening, he used to sit in this room, and could bear what was passing on the stage, and join in the chorus of *God save the King*, and *Britannia rules the Waves*—then the favourite songs of Englishmen. The war being at an end, amongst those who left the public service with a pension was the father of our novelist. Coming to London, he subsequently found lucrative employment for his talents on the press as a reporter of parliamentary debates. Charles Dickens may, therefore, be said to have been in his youth familiarised with "copy;" and when his father, with parental anxiety for his future career, took the preliminary steps for making his son an attorney, the dreariness of the proposed occupation fell so heavily upon the mind of the future author, that he induced his father to permit him to resign the law, and join the parliamentary corps of a daily newspaper. His first engagement was on the *True Sun*, an ultra-liberal paper, then carrying on a fierce struggle for existence, from

the staff of which he afterwards passed into the reporting ranks of the *Morning Chronicle*. On this paper, he obtained reputation as a first-rate man—reports being exceedingly rapid, and no less correct. In the columns of the *Chronicle* he soon gave proof of other talents than those of a reporter; for in the evening edition of that journal appeared the *Sketches of English Life and Character*, afterwards collected into the two well-known volumes of *Sketches by Boz*, published respectively in 1836 and 1837. These at once attracted considerable notice, and obtained great success; and the publisher of the collected edition, anxious to make the most of the prize which had fallen to his lot, gladly came to an arrangement with Mr Dickens and Seymour, the comic draughtsman—the one to write and the other to illustrate a book which should exhibit the adventures of a party of Cockney sportsmen. Hence the appearance of *Pickwick*, a book which made its author's reputation and the publishers' fortune. After the work had commenced, poor Seymour committed suicide, and Mr Hablot K. Browne was selected to continue the illustrations, which he did under the signature of "Phiz." Meanwhile, Mr Dickens had courted and married the daughter of Mr George Hogarth, then, and now, a musical writer; a man of considerable attainments, and who, in his earlier days, whilst a writer to the *Signet* in Edinburgh, enjoyed the intimate friendship of Sir Walter Scott, Jeffrey, and the other literary notables at that day adorning the Modern Athens. The great success of *Pickwick* brought down upon its author demands from all sides for another work, and "Boz" agreed to write *Nicholas Nickleby*, to be published in monthly parts. In the prefatory notices, which give additional value to the cheap and elegant reprint of the works of Dickens, we are indulged with slight glimpses of his own recollections, personal and literary. It is unnecessary to note the titles of Mr Dickens's subsequent works, of which have justly obtained popularity. He has latterly entered on a path not dissimilar to our own, and in this he has our very best wishes. The cause of social melioration needs a union of hearts and hands.

ARCHBISHOP WHATELY'S BOOK OF SYNONYMS.

ACCURACY of language is one of the things which, in ordinary speech and writing, is but indifferently observed. The reason, perhaps, is to be sought, not in any general indifference to correctness or precision, but rather in the want of some recognised authority, or specific rules or principles, to which the use of words, apparently synonymous, yet of slightly different signification, might be distinctly and easily referred. It is in regard to the finer shades of meaning, the subtle touches of expression, the application of words to phrases where the strictest exactness and perspicuity are required, that an ordinary English style is apt to become loose and shadowy; and it is precisely here that we are entitled to expect the severest, chastest form of utterance. Coleridge used to complain of general confounding of the word 'notion' with 'idea' and was often at great pains to point out the distinction between the two, as also between many other words similarly misused. Archdeacon Hare, too, has remarked upon the common misapplication of such words as 'education' for 'instruction,' 'government' for 'administration,' 'the church' for 'the priesthood' or 'ministry,' and indeed holds that such a confounding of terms leads to serious practical misunderstanding and confusions.* Any one, upon reflection, will perceive that in the common use of these and numberless other words, there is often a signal lack of clearness and

* See *Gleanings at Truth*. First series.

precision, and will hardly fail to notice that the error proceeds from a want of due attention to the nice and peculiar meanings of words which are vaguely presumed to have the same signification.

As a help to those who may wish to attain a somewhat more than common correctness of style and language, Archbishop Whately has recently published a small work on *English Synonyms*;* and the rapidity with which the first edition has been disposed of, leads us to infer that the public is to some extent prepared to take an interest in the subject. The second edition, 'revised and enlarged,' is now before us, and it is thought that a brief glance at its contents may not be unacceptable to some of our present readers.

The word 'synonym,' as the archbishop observes, is, in strict reality, a misnomer. 'Literally, it implies an exact coincidence of meaning in two or more words, in which case there would be no room for discussion; but it is generally applied to words which would be more correctly termed *pseudo-synonyms*—that is, words having a shade of difference, yet with a sufficient resemblance of meaning to make them liable to be confounded. And it is in the number and variety of these that, as the Abbé Girard well remarks, the richness of a language consists. To have two or more words with exactly the same sense, is no proof of copiousness, but simply an inconvenience. A house would not be called well furnished from its having a larger number of chairs and tables of one kind than were needed, but from its having a separate article for each distinct use. The more power we have of discriminating the nicer shades of meaning, the greater facility we possess of giving force and precision to our expressions. Our own language possesses great advantages in this respect; for being partly derived from the Teutonic, and partly from the Latin, we have a large number of duplicates from the two sources, which are, for the most part, though not universally, slightly varied in their meaning.

'These slight variations of meaning,' he proceeds, add to the copiousness of the English language, by affording words of more or less familiarity, and of greater and less force. This may easily be understood, if we consider that the branch of the Teutonic, spoken in England during the Anglo-Saxon period, never became extinct, but that three-fourths of the English language at present consist of words altered or derived from that ancient dialect; that these words usually express the most familiar ideas—such as *man, house, land, &c.*; and that the French terms gradually introduced, being those of a more highly civilised people, were adapted to express the more refined ideas. This is true even of physical objects; thus, for instance, most of the names of the animals used for food are still Teutonic—such as *ox, sheep, swine, &c.* The Anglo-Saxons, like the modern Germans, had no objection to say *ox-flesh, sheep-flesh, swine's-flesh*; but the Norman conquerors, introducing a more refined cookery, introduced with it French words for the flesh of the animal; hence we have *beef, mutton, pork, &c.*'

It has not been the author's design to notice *all* the synonyms in the language—that, as he remarks, would be an almost endless undertaking; 'but merely, after excluding technical terms, and words which do exactly coincide, to select a few of those groups of words which are in most frequent use, and are most liable to be confounded.' His purpose, perhaps, will be more distinctly shewn, if we add a few more sentences from the preface.

'Many persons,' says he, 'imagine that two words must either coincide precisely in their meaning, so as to be, in the primary and strict sense of the word, "synonymous," or else stand for two (more or less)

distinct things. Indeed, it would often be regarded as almost a truism to assert this; but those who maintain such an opinion overlook the fact, that two words, without exactly coinciding in sense, may nevertheless relate to one and the same thing, regarded in *two different points of view*. An illustration of this is afforded in the relation which exists between the words, "inference" and "proof." Whoever justly infers, proves; and whoever proves, infers; but the word "inference" leads the mind from the premises which have been assumed, to the conclusion which follows from them; while the word "proof" follows a reverse process, and leads the mind from the conclusion to the premises. We say: "What do you infer from this?" and "How do you prove that?"* Another illustration may be quoted in the synonyms, "expense" and "cost." The same article may be expensive and costly; but we speak of *expense* in reference to the means of the purchaser; of *cost*, in reference to the actual value of the article.'

This work does not profess to deal much with *etymologies*; the author thinking that any very strict attention to the *derivation* of words, in connection with synonyms, would only tend to confuse the subject. The history of the origin and growth of words must undoubtedly throw light upon their meanings; but he, nevertheless, holds the two questions to be completely distinct and separable; and thinks that, in an inquiry into the *actual* and *present* meaning of a word, the consideration of what it originally meant may frequently lead us into error. A few suggestive remarks are given upon this matter.

'Our question is, not what *ought* to be, or formerly was, the meaning of a word, but what it *now* is; nor can we be completely guided by quotations from Shakspeare or Milton, or even from Addison or Johnson. Language has undergone such changes, even within the last sixty or seventy years, that many words, at that time considered pure, are now obsolete; while others—of which the word "mob" is a specimen—formerly slang, are now used by our best writers, and received, like pardoned outlaws, into the body of respectable citizens.' The standard, accordingly, to which the author refers in the work before us, is the sense in which a word is used by the purest writers and most correct speakers of our own days.

The synonyms are arranged or classed according to the parts of speech to which they belong—namely, into particles, nouns, adjectives, and verbs. The uses of all the words are well defined, and sufficiently illustrated by examples; a table of contents and a complete index are also added, rendering reference to any word as easy as looking for it in a dictionary. The table of contents, indeed, will be found to serve most of the purposes of a vocabulary of synonyms: a glance at it will frequently give you all the words of similar signification to the particular one for which you may happen to require an equivalent. From the part of the book relating to *verbs*, we take the following; the words under notice being, *To teach, instruct, inform, educate*:—

'Of these words, the first two are often used synonymously, but they have also a distinct meaning. "Teaching," strictly speaking, when distinguished from instruction, is applied to the practice of an art or branch of knowledge: instruction, to the theory. A child is, correctly speaking, *instructed* in the grammar of a language, and *taught* to speak the language. Thus, teaching may be merely mechanical; while "instruction" implies a degree of understanding in the pupil, as well as in the master. A child who has been *taught* to learn lessons by rote, without understanding them, will find difficulty in comprehending *instruction* in the principles of what he has learned: hence, we speak of *teaching* a brute, but never of *instructing* it.

* *A Selection of English Synonyms*. Second Edition. Parker, London: 1853.

* See Whately's *Logic*, book iv., chap. 3, § 1, in which the above is illustrated by the difference between the road from London to York and the road from York to London.

'Information,* again, is distinguished from instruction, in relation to the truths conveyed by it. Matters of fact, made known to one who could not have known them before, are called information: instruction elicits new truths out of subject-matter *already* existing in the mind—(see Whately's *Logic*, book iv. § 1.)

'A traveller gives us information respecting foreign countries; a metaphysician instructs us in the principles of moral science—principles drawn from facts already known to us. The two processes may take place at the same time: a child in learning a lesson receives both information and instruction: he is taught things he never knew before, and also taught to apply and make use of what he does know already. In fact, pure mathematics is the only branch of instruction which includes no information, as the propositions are all based on principles previously assumed. In short, a person who is informed, *knows* something he did not before; one who is instructed, *understands* something he did not before; one who is taught, can *do* something he could not do before.

'Education is more comprehensive than any of the other words before us. It includes the *whole course* of moral and intellectual teaching. One who gives occasional lessons is not said to *educate*. To *educate* (agreeably to its derivation, from "e-duco," not "in-duco"), includes the *drawing out* of the faculties, so as to teach the pupil *how to teach himself*; which is one of the most valuable of arts.

'Moral training, considered *by itself*, is called "teaching;" this constitutes no exception to the rule laid down, as its object is to enable us, not to *know*, but to *do* what is right.—(P. 32-34.)

'Few words, perhaps, are more apt to be misapplied than the string of adjectives treated of in the section next quoted—namely, *benevolent, beneficent, charitable, munificent, liberal, bountiful, philanthropic*.

'Benevolent and beneficent, together with their conjugates, have curiously diverged from their original meaning. Etymologically, "benevolent" implied merely *wishing well* to others, and "beneficent" *doing well*; now, "benevolent" includes both kinds of feelings and actions, and "beneficent" is restricted to acts of kindness on a great scale, and generally performed by some one of exalted station and character: hence, we speak of the "beneficence" rather than the "benevolence" of the Creator. It may perhaps be said to follow from this, that "benevolent" draws our attention more to the character of the agent; "beneficent," to that of the act performed—retaining, so far, a tinge of their etymology.

'"Charitable" (when not used in reference to a mild and candid judgment of others) seems to be restricted to one kind of benevolence—that which consists in *alms-giving*.

'"Munificent" resembles "beneficent," in referring always to favours on a large scale, and conferred by superiors; but there is this important difference, that "beneficent" always implies some real and essential good done, while "munificent," as its derivation implies, may be applied equally to any *gift*, whether really useful or not. One who makes a present of jewellery or pictures to a friend, is munificent, but would not be called "beneficent." If he raised a distressed family from starvation, the word "beneficent" would be more appropriate. But one who gives largely to the public, or to some institution, is called *munificent*. It seems to convey the idea of splendour. No one can be called munificent who does not give on a large scale.

'Any one who is ready to give *freely*, as the etymology implies, on whatever scale, is "liberal." "Bountiful," again, is stronger than "liberal," and implies giving in

abundance; it also differs from "liberal" in being restricted to *giving*; while "liberal" is applied to an easy style of expenditure in general; to the reverse, in short, of "stingy," or "miserly." Many people live in a *liberal* style, who are very far from being "bountiful." Bountiful always seems to imply, giving out of an ample store.

'"Philanthropic," as its etymology indicates, implies benevolence solely in reference to the *human race*, and always to masses, not to individuals. One who devises some plan to benefit numbers, is called "philanthropic;" but we should not talk of "philanthropically giving a loaf to a hungry child."—(P. 83-85.)

As space is beginning to press, our last extract must be short: it relates to words often enough employed indiscriminately—*imagination, conception, fancy*. "Imagination" and "fancy" are frequently confounded together, but are, nevertheless, very distinct in their signification. In the first place, "imagination" implies more of a *creative* power than "fancy;" it requires a greater combination of various powers, and is therefore a higher exercise of genius. "Fancy," on the other hand, is more an employment of ingenuity and taste, though it also requires inventive power. Secondly, "imagination" implies a longer flight; "fancy," rather a succession of short efforts: the one is a steady blaze; the other, a series of sparkles. An epic poem would require an exercise of the first; a ballad, or other lighter production, of the last: hence, we may see that the difference between the two is, in some measure, one of subject-matter; for the same power which we call "fancy" when employed in a melody of Moore, would be called "imagination" in the works of Dante or Milton. In short, the efforts of "fancy" bear the same relation to those of "imagination" that the carving and polishing of a gem or seal does to sculpture.

'In the third place, *wit* may come into works of "fancy," and could not be admitted into the province of "imagination." The same with what are called *conceits*.

'"Conception" has something in common with imagination, but it implies more decidedly a creative power, and is referred to something tangible and real; whereas, in efforts of fancy and imagination, there is always a consciousness of unreality. The province of "conception" is that which has a real existence: hence, the productions of painters, sculptors, and musicians, are called "conceptions." "Conception" also denotes something framed and originated in our *own* mind; whereas the imagination or fancy may be acted on merely from without. The poet or writer of fiction exercises his own conceptions, but awakens the imagination of his readers.'

These quotations will give as general a notion of the work as can be conveyed by a few extracts. To those among our readers who may be in quest of such a book, we can decidedly recommend it as one that is certain to be useful. It is by far the best of the kind that we have ever happened to meet with; and we think that if it were universally studied and consulted, the result would be a great improvement of expression, both in common speech and literature.

'CHAPTER ON CATS.'

In No. 419 of this Journal, an article with the above heading mentions among the exports from New York to New Granada 100 *cats*. Wherever our contributor may have picked up his intelligence, the original source is the *New York Herald*; but, unluckily, a paper of a more practical character—if we may judge from its title—*The Dry-Goods Reporter*, gives the custom-house entry in full, in which the change of a single vowel makes a prodigious difference. The entry is this: '100 *cots*—125 dollars—to Granada.'

* The nouns are used here instead of the verbs for convenience's sake, as they precisely correspond.

A MARINER'S WIFE.

'An me, my dream!' pale Helen cried,
With hectic cheeks aglow:
'Why wake me! Hide that cruel beam!
I'll not win such another dream
On this side heaven, I know.

'I almost feel the leaping waves,
The wet spray on my hair,
The salt breeze singing in the sail,
The kind arms, strong as iron-mail,
That held me safely there.

'I'll tell thee:—On some shore I stood,
Or sea, or inland bay,
Or river broad, I know not—save
There seemed no boundary to the wave
That chafed and moaned away.

'The shore was lone—the wave was lone—
The horizon lone; no sail
Broke the dim line 'twixt sea and sky,
Till slowly, slowly one came by,
Half ghostlike, gray and pale.

'It was a very little boat,
Had neither oars nor crew;
But as it shoreward bounded fast,
One form seemed leaning by the mast—
And Norman's face I knew!

'He never looked nor smiled at me,
Though I stood there alone;
His brow was very grave and high,
Lit with a glory from the sky—
The wild bark bounded on.

'I shrieked: "Oh, take me—take me, love!
The night is falling dread."—
"My boat may come no nearer shore;
And, hark! how mad the billows roar!
Art thou afraid!" he said.

"'Afraid! with thee?"—"The wind sweeps fierce
The foamy rocks among;
A perilous voyage waiteth me."
"Then, then, indeed, I go with thee,"
I cried, and forward sprung.

'All drenched with brine, all pale with fear—
Ah no, not fear; 'twas bliss!
I felt the strong arms draw me in:
If after death to heaven I win,
'Twill be such joy as this!

'No kiss, no smile, but aye that clasp—
Tender, and close, and brave;
While, like a tortured thing, upleapt
The boat, and o'er her deck there swept
Wave thundering after wave.

'I looked not to the stormy deep,
Nor to the angry sky;
Whether for life or death we wrought,
My whole world dwindled to one thought—
Where he is, there am I!

'On—on—through leaping waves, slow calmed,
With salt spray on our hair,
And breezes singing in the sail,
Before a safe and pleasant gale,
The boat went bounding fair:

'But whether to a shore we came,
Or seaward sailed away,
Alas! to me is all unknown:
O happy dream, too quickly flown!
O cruel, cruel day!

Pale Helen lived—or died: dull time
O'er all that history rolls;
Sailed they or sunk they on life's waves?—
I only know earth holds two graves,
And heaven two blessed souls.

REMITTANCES TO AND FROM EMIGRANTS.

Within the past few years, a system of foreign exchanges has been perfected in this country, by which the smallest sum of money can be remitted either way across the Atlantic, with perfect security and the greatest dispatch. Drafts are drawn as low as 1s. sterling, which are cashed in any part of Great Britain or the United States. This, to emigrants who wish to bring over their money without fear of loss, or to residents here who wish to remit small sums to their relatives or friends in Europe, to enable them to come to this country, is of vast importance, as it guarantees them against loss; that is, when the drafts are good. This is, therefore, the great point at issue. To obtain drafts of undoubted credit and security is the first thing to be considered. There are dozens of drawers on both sides of the Atlantic, all of whom have their friends, who place more or less confidence in the character of the bills drawn. We have no doubt they are all sound and solvent. We know nothing now to the contrary. The drafts can be obtained in any city in the Union, for any amount, from 1s. sterling upwards, drawn upon some place in Europe; and drafts can be obtained in various European cities payable in any city of the United States.—*Abridged from the New York Herald.*

FOREST-TREES.

In contemplating the length of life of one of the reverend and hoary elders of the forest, we are apt to forget that it is not to be measured by the standard of man or of the higher animals; for it is really not the measure of an individual existence, but, as it were, of the duration of an empire or a nation. A tree is a populous community, presided over by an oligarchy, of which the flowers are the aristocracy, and the leaves the working-classes. The life of the individual members of the commonwealth is brief enough, but the state of which they are members, has often a vast duration; and some of those whose ages we have referred to, could they take cognisance of human affairs, would look with contempt upon the instability and irregularity of human governments and states, as compared with the unchanging order and security of their own.—*Professor Forbes in Ari-Journal.*

WHISKY AND MISERY.

Whisky and misery, whichever be cause, whichever be effect, always go together. There has been, as is well known, a failure of the potato-crop, and consequently a famine, in the West Highlands and Hebrides. In the island of Mull, about £3000 of money raised in charity was spent in the year ending October 10, 1848, for the eleemosynary support of the people. In the same space of time, the expenditure of the people on whisky was £6099! We do not know how much had previously been spent on whisky in that island; but we may judge from the fact ascertained regarding Skye. In the year ending October 10, 1850, the sum paid in the latter island for whisky was £10,855—considerably more than double the amount expended in relief by the *Destitution Fund*, and more than double the consumption of the same district in 1845, the year before the distress commenced! 'That is,' says the *Quarterly Review*, which quotes the facts from excellent authority, 'the increased consumption of whisky exactly tallies with the extraneous aid received; in other words, the whole amount of charitable assistance went in whisky!'

Printed and Published by W. and R. CHAMBERS, High Street, Edinburgh. Also sold by W. B. ONE, Amen Corner, London; D. N. CHAMBERS, 55 West Nile Street, Glasgow; and J. M'GLASSAR, 50 Upper Sackville Street, Dublin.—Advertisements for Monthly Parts are requested to be sent to MAXWELL & CO., 31 Nicholas Lane, Lombard Street, London, to whom all applications respecting their insertion must be made.

PRICE 1½d.

THE DINNER-BELL.

Is one of Webster's magnificent speeches, he remarks that so vast are the possessions of England, that her morning drum-beat, following the sun and keeping company with the hours, circles the earth daily with one continuous and unbroken strain of its martial airs. There is another musical sound, within the British islands themselves, which does not as yet quite traverse the whole horary circle, but bids fair to do so in the course of time, and to this we must direct the attention of the American secretary, as a fitting subject for a new peroration. We allude to the Dinner-bell. At noon, in the rural districts of England, this charming sound is heard tinkling melodiously from farm or village factory; at one, in the more crowded haunts of industry, the strain is taken up ere it dies; and by the time it reaches Scotland, a full hungry peal swells forth at two. At three till past four there is a continuous ring from house to house of the small country gentry; and at five this becomes more distinct and sonorous in the towns, increasing in importance till six. From that time till seven and half-past, it waxes more and more fashionable in the tone, till at eight it stops abruptly: not like an air brought to a conclusion, but like one broken off accidentally, to be by and by resumed.

The dinner hours of the labouring-class are no doubt regulated according to business, and perhaps receive some modification from national character. An Englishman, for instance, is said to work best after his meal, and accordingly his dinner makes its appearance sometimes as early as noon, but never later than one; while a Scotchman, who is fit for anything when half-starved, is very properly kept without solid food till two o'clock. As for the smaller gentry, who scorn to dine at workmen's hours, and yet do not pretend to the abnegation of the great, they may follow their own fancy without doing any harm to others; but the case is different as regards the hours assigned to *dinner-parties*, for these affect the health and comfort of the whole body of the gentry together.

We are no enemy to dinner-parties; on the contrary, we think we have not enough of them, and we never shall have enough, till some change takes place in their constitution. We are a small gentleman ourselves, who dine at the modest hour of four, and what is the use to us of a six or seven o'clock invitation? We accept it, of course, being socially disposed, and being, moreover, philosopher enough to see that such meetings are good for men in society: but so far as the meal itself goes, it is to us either useless or disagreeable. If we have dined already, we do not want another dinner; and if we have not dined, our appetite is lost from sheer

want. It is vain to say, Let us all dine habitually at six—seven—eight o'clock. Few of us will—few of us can—none of us ought. Nature demands a solid meal at a much earlier hour; and true refinement suggests that the object of the evening reunion should not be the satisfaction of the day's hunger. Only half of this fact is seen by the classes who give the law to fashion, and that half consists of the grosser and coarser necessity. They have already, more especially at their country seats, taken to the tiffin of the East, and at a reasonable hour make a regular dinner of hot meats, and all the usual accessories, under the name of lunch. So complete is this meal, that the ladies, led away no doubt by association, meet some hours afterwards in mysterious conclave, to drink what our ancestors called 'a dish of tea;' and having thus diluted the juices of their stomachs for the reception of another supply of heavy food, they descend to dinner!

The evening dinner is, therefore, a mere show-dinner, or something worse. But it is still more objectionable on the score of taste than on the score of health. We find no fault with the elegances of the table, in plate, crystal, china, and so forth; but an English dinner is not an elegant meal. The guests are supposed, by a *polite* fiction, to have the hunger of the whole day to satisfy, and provision is made accordingly. Varieties of soup, fish, flesh, fowl, game, rich-made dishes, load the board spread for a group of well-dressed men and women, known to have already dined, and who would affect to shudder at so heavy a meal, if it was termed supper. There is a grossness in this arrangement which is strangely at variance with the real advancement of the age in refinement; but it has likewise a paralysing effect both upon the freedom and delicacy of social intercourse. These show-dinners are too costly to be numerous. Even a comparatively wealthy man is compelled to look closely to the number of his entertainments. He scrutinises the claims of his acquaintance; he keeps a debtor and creditor account of dinners with them; and if now and then he invites a guest for the sake of his social qualities, he sets him down in the bill of cost. This does away with all the finer social feelings which it should be the province of such meetings to foster and gratify, and adds a tone of moral vulgarity to the material vulgarity of the repast.

Is it impossible to bring about a reform in this important matter? Difficult, not impossible. Dinner-giving is not an integral part of the monarchy, and it might therefore be touched—if not too rudely—without a political revolution. The grand obstacle would be the unsettled claims. A has given B a show-dinner,

and it is the duty of B to return it. Invitation for invitation is the law of the game. How, then, stands the account? Would it be necessary to institute a dinner-insolvency court, where all defaulters might take the benefit of the act? We think not. No creditor in his senses would refuse a handsome composition; and if it could be shewn—as it might in the present case—that the composition was in real, though not ostensible value, equivalent to the debt, hesitation would vanish. Before proceeding to shew this, we shall present what may be called the common-sense statement of the whole case:—

Mankind in their natural state dine at noon, or at least in the middle of the working-day. It is the middle meal of the day—the central of three. In our artificial system of society, it has been postponed to a late hour of the afternoon, so as either to become the second of two meals, or, where lunch is taken, the third of three. The change is not consistent with hygienic principle; for, if lunch be not taken, the interval between breakfast and dinner is too great, and in that case hunger tempts to make the meal too heavy for the exhausted powers of the stomach: if, on the contrary, lunch be taken, dinner becomes an absurdity, as in that case a meal so elaborate and heavy is not required, and cannot healthfully be partaken of at so late an hour. Nevertheless, in a plan of life which devotes the eight or nine hours after breakfast either to business or to out-door amusements, it is needless to think of reviving the old meridian dinner for any but ladies and other stay-at-home people; nor even for them, seeing that they must be mainly determined in their arrangements by those leading members of the family who have to spend that part of the day away from home.

There is a need for some reform which would at once accommodate the busy, and save the multitude from the disadvantages of heavy six-and-seven-o'clock dinners. This might be effected by arranging for only a supper at six or seven o'clock—that is, some lighter meal than dinner—leaving every one to take such a lunch in the middle of the day as he could find an opportunity of eating. Let this supper be the meal of family reunions—the meal of society. Composed of a few light tasteful dishes, accompanied by other indulgences, according to taste or inclination, and followed by coffee, it would be a cheerful and not necessarily unhealthful affair. As a meal to which to invite friends, being cheaper, it would allow of more society being indulged in than is compatible with the monstrous presentments of meat and drink which constitute the modern company dinner. It would be practically a revival of those nice supper-parties which our grandfathers indulged in after the hours of business, and of the pleasantness of which we have such glowing accounts.

That this is really the common-sense view of the question, can hardly be doubted. By bringing the cost within reasonable limits, the plan proposed relieves the entertainment from moral vulgarity; and by avoiding all suggestion of a meeting for the gratification of mere physical hunger, it relieves it from material vulgarity. We have laughed too heartily at the dinner of the ancients in 'Peregrine Pickle,' to wish to lead back the age to a classic model; and yet on all subjects connected with taste, there are some things to be learned from that people whose formative genius is still the wonder of the world. The meal of society among the Greeks consisted of only two courses, or, to

speaking more strictly, of one course and a dessert; and the first or solid course was in all probability made up of small portions of each kind of food. The more vulgar Romans added in all cases a third, but occasionally a fourth, fifth, sixth, even a seventh course; and at the fall of the empire, barbarian taste uniting with the *blase* luxury of Rome, heaped viand upon viand, and course upon course, till the satire of a later poet became mere common-place:—

'Is this a dinner, this a genial room?

No; 'tis a temple, and a hecatomb!'

This extravagance has gradually given way in the course of civilisation. We have no more meals consisting of a score of courses; no more gilded pigs, fash, and poultry; no more soups, each of three or four different colours: but as yet we are only in the midst of the transition, and have not got back even to the comparative refinement of the Greeks. At the end of their first course, the more earthly part of the entertainment was already over. Then the guests washed their hands; then they were presented with perfumes and garlands of flowers; and then they drank wine, accompanied with the singing of the *pæan* and the sound of flutes. Such adjuncts, with us, would for the most part be out of place and time; but some of them might be taken metaphorically, and others entirely changed—such as the libation to the gods—to suit a new religious feeling, and a new form of manners. The modern *cæna* might thus be made to surpass that of the ancients in refinement and elegance; and it would include, as a matter of course, some of the amusements—varying from a song to a philosophical discussion—which gave the charm to their symposia.

As for the symposium, we shall have nothing to do with that vexed subject, further than just to hint—for we should be loath to exclude from the benefit of our proposed reform a certain numerous and respectable class of the community—that in ancient times it had no necessary connection with the dinner at all. A little wine-and-water was drunk during the dessert—never during the first course—and then the meal was over. The symposium was literally a drinking-party, given, for the sake of convenience, after the dinner-party; but so far from forming a part of the latter, the guests were sometimes different. It was, in fact, in this respect, like the evening company we occasionally find assembled in the drawing-room on getting up from our show-dinners.

But such references to the customs of bygone ages are introduced merely to shew, that among the most accomplished people of history, the social meal was looked upon as a field for the display of taste, not of that barbarian magnificence which consists in quantity and cost. The *cæna* of the moderns should far excel that of the Greeks in elegance, refinement, and simplicity. We have all history for our teacher; we have a finer system of morals; we have a purer and holier religion; and a corresponding influence should be felt in our social manners. When the object of the feast is no longer the satisfaction of mere physical hunger, it should be something intended to minister to the appetites of the mind. When the dinner is no longer the chief thing, some trouble will doubtless be taken with the assortment of the company. Simultaneously with the business of eating and drinking, we shall have anecdote, jest, song, music, smiles, and laughter,

to make us forget the business or troubles of the day ; and in the morning, instead of arranging our debtor and creditor account of invitations, we shall throw in the evening's gratification to strike the balance, and then make haste to begin a new score.

TWO KINDS OF HONESTY.

SOME few years ago, there resided in Long Acre an eccentric old Jew, named Jacob Benjamin : he kept a seed shop, in which he likewise carried on—not a common thing, we believe, in London—the sale of meal, and had risen from the lowest dregs of poverty, by industry and self-denial, till he grew to be an affluent tradesman. He was, indeed, a rich man ; for as he had neither wife nor child to spend his money, nor kith nor kin to borrow it of him, he had a great deal more than he knew what to do with. Lavish it on himself he could not, for his early habits stuck to him, and his wants were few. He was always clean and decent in his dress, but he had no taste for elegance or splendour in any form, nor had even the pleasures of the table any charms for him ; so that, though he was no miser, his money kept on accumulating, whilst it occurred to him now and then to wonder what he should do with it hereafter. One would think he need not have wondered long, when there were so many people suffering from the want of what he abounded in ; but Mr Benjamin, honest man, had his crotchets like other folks. In the first place, he had less sympathy with poverty than might have been expected, considering how poor he had once been himself ; but he had a theory, just in the main, though by no means without its exceptions—that the indigent have generally themselves to thank for their privations. Judging from his own experience, he believed that there was bread for everybody that would take the trouble of earning it ; and as he had had little difficulty in resisting temptation himself, and was not philosopher enough to allow for the varieties of human character, he had small compassion for those who injured their prospects by yielding to it. Then he had found, on more than one occasion, that even to the apparently well-doing, assistance was not always serviceable. Endeavour was relaxed, and gratuities, once received, were looked for again. Doubtless, part of this evil result was to be sought in Mr Benjamin's own defective mode of proceeding ; but I repeat, he was no philosopher, and in matters of this sort he did not see much farther than his nose, which was, however, a very long one.

To public charities he sometimes subscribed liberally ; but his hand was frequently withheld by a doubt regarding the judicious expenditure of the funds, and this doubt was especially fortified after chancing to see one day, as he was passing the Crown and Anchor Tavern, a concourse of gentlemen turn out, with very flushed faces, who had been dining together for the benefit of some savages in the Southern Pacific Ocean, accused of devouring human flesh—a practice so abhorrent to Mr Benjamin, that he had subscribed for their conversion. But failing to perceive the connection betwixt the dinner and that desirable consummation, his name appeared henceforth less frequently in printed lists, and he felt more uncertain than before as to what branch of unknown posterity he should bequeath his fortune.

In the meantime, he kept on the even tenor of his way, standing behind his counter, and serving his customers, assisted by a young woman called Leah Leet, who acted as his shopwoman, and in whom, on the whole, he felt more interest than in anybody else in the world, inasmuch that it even sometimes glanced across his mind, whether he should not make her the heiress of all his wealth. He never, however, gave her the least reason to expect such a thing, being himself

incapable of conceiving, that if he entertained the notion, he ought to prepare her by education for the good-fortune that awaited her. But he neither perceived this necessity, nor, if he had, would he have liked to lose the services of a person he had been so long accustomed to.

At length, one day a new idea struck him. He had been reading the story of his namesake, Benjamin, in the Old Testament, and the question occurred to him, how many amongst his purchasers of the poorer class—and all who came to his shop personally were of that class—would bring back a piece of money they might find amongst their meal, and he thought he should like to try a few of them that were his regular customers. The experiment would amuse his mind, and the money he might lose by it he did not care for. So he began with shillings, slipping one in amongst the flour before he handed it to the purchaser. But the shillings never came back—perhaps people did not think so small a sum worth returning ; so he went on to half-crowns and crowns, and now and then, in very particular cases, he even ventured a guinea ; but it was always with the same luck, and the longer he tried, the more he distrusted there being any honesty in the world, and the more disposed he felt to leave all his money to Leah Leet, who had lived with him so long, and to his belief, had never wronged him of a penny.

'What's this you have put into the gruel, Mary ?' said a pale, sickly-looking man one evening, taking something out of his mouth, which he held towards the feeble gleams emitted by a farthing rush-light standing on the mantel-piece.

'What is it, father?' inquired a young girl, approaching him. 'Isn't the gruel good ?'

'It's good enough,' replied the man ; 'but here's something in it : it's a shilling, I believe.'

'It's a guinea, I declare!' exclaimed the girl, as she took the coin from him and examined it nearer the light.

'A guinea!' repeated the man ; 'well, that's the first bit of luck I've had these seven years or more. It never could have come when we wanted it worse. Shew it us here, Mary.'

'But it's not ours, father,' said Mary. 'I paid away the last shilling we had for the meal, and here's the change.'

'God has sent it us, girl! He saw our distress, and he sent it us in His mercy!' said the man, grasping the piece of gold with his thin, bony fingers.

'It must be Mr Benjamin's,' returned she. 'He must have dropped it into the meal-tub that stands by the counter.'

'How do you know that?' inquired the man with an impatient tone and a half-angry glance. 'How can you tell how it came into the gruel? Perhaps it was lying at the bottom of the basin, or at the bottom of the sauce-pan. Most likely it was.'

'O no, father,' said Mary : 'it is long since we had a guinea.'

'A guinea that we knew of; but I've had plenty in my time, and how do you know this is not one we had overlooked ?'

'We've wanted a guinea too much to overlook one,' answered she. 'But never mind, father ; eat your gruel, and don't think of it : your cheeks are getting quite red with talking so, and you won't be able to sleep when you go to bed.'

'I don't expect to sleep,' said the man peevishly ; 'I never do sleep.'

'I think you will, after that nice gruel!' said Mary, throwing her arms round his neck, and tenderly kissing his cheek.

'And a guinea in it to give it a relish too!' returned the father, with a faint smile and an expression of archness, betokening an innor nature very different

from the exterior which sorrow and poverty had incrustured on it.

His daughter then proposed that he should go to bed; and having assisted him to undress, and arranged her little household matters, she retired behind a tattered, drab-coloured curtain which shaded her own mattress, and laid herself down to rest.

The apartment in which this little scene occurred, was on the attic storey of a mean house, situated in one of the narrow courts or alleys betwixt the Strand and Drury Lane. The furniture it contained was of the poorest description; the cracked window-panes were coated with dust; and the scanty fire in the grate, although the evening was cold enough to make a large one desirable—all combined to testify to the poverty of the inhabitants. It was a sorry retreat for declining years and sickness, and a sad and cheerless home for the fresh cheek and glad hopes of youth; and all the worse, that neither father nor daughter was 'to the manner born'; for poor John Glegg had, as he said, had plenty of guineas in his time; at least, what should have been plenty, had they been wisely husbanded. But John, to describe the thing as he saw it himself, had always 'had luck against him.' It did not signify what he undertook, his undertakings invariably turned out ill.

He was born in Scotland, and had passed a great portion of his life there; but, unfortunately for him, he had no Scotch blood in his veins, or he might have been blessed with some small modicum of the caution for which that nation is said to be distinguished. His father had been a cooper, and when quite a young man, John had succeeded to a well-established business in Aberdeen. His principal commerce consisted in furnishing the retail-dealers with casks, wherein to pack their dried fish; but partly from good-nature, and partly from indolence, he allowed them to run such long accounts, that they were apt to overlook the debt altogether in their calculations, and to take refuge in bankruptcy when the demand was pressed and the supply of goods withheld—his negligence thus proving, in its results, as injurious to them as to himself. Five hundred pounds embarked in a scheme projected by a too sanguine friend, for establishing a local newspaper, which 'died ere it was born'; and a fire, occurring at a time that John had omitted to renew his insurance, had seriously damaged his resources, when some matter of business having taken him to the Isle of Man, he was agreeably surprised to find that his branch of trade, which had of late years been alarmingly declining in Aberdeen, was there in the most flourishing condition. Delighted with the prospect this state of affairs opened, and eager to quit the spot where misfortune had so unrelentingly pursued him, John, having first secured a house at Ramsay, returned to fetch his wife, children, and merchandise, to this new home. Having freighted a small vessel for their conveyance, he expected to be deposited at his own door; but he had unhappily forgotten to ascertain the character of the captain, who, under pretence that, if he entered the harbour, he should probably be wind-bound for several weeks, persuaded them to go ashore in a small boat, promising to lie to till they had landed their goods; but the boat had no sooner returned to the ship, than, spreading his sails to the wind, he was soon out of sight, leaving John and his family on the beach, with—to recur to his own phraseology—'nothing but what they stood up in.'

Having with some difficulty found shelter for the night, they proceeded on the following morning in a boat to Ramsay; but here it was found that, owing to some informality, the people who had possession of the house refused to give it up, and the wanderers were obliged to take refuge in an inn. The next thing was to pursue, and recover the lost goods; but some weeks elapsed before an opportunity of doing so could be found; and at length, when John did reach Liverpool,

the captain had left it, carrying away with him a considerable share of the property. With the remainder, John, after many expenses and delays, returned to the island, and resumed his business. But he soon discovered to his cost, that the calculations he had made were quite fallacious, owing to his having neglected to inquire whether the late prosperous season had been a normal or an exceptional one. Unfortunately, it was the latter; and several very unfavourable ones that succeeded, reduced the family to great distress, and finally to utter ruin.

Relinquishing his shop and his goods to his creditors, John Glegg, heart-sick and weary, sought a refuge in London—a proceeding to which he was urged by no prudential motives, but rather by the desire to fly as far as possible from the scenes of his vexations and disappointments, and because he had heard that the metropolis was a place in which a man might conceal his poverty, and suffer and starve at his ease, untroubled by impertinent curiosity or officious benevolence; and, above all, believing it to be the spot where he was least likely to fall in with any of his former acquaintance.

But here a new calamity awaited him, worse than all the rest. A fever broke out in the closely-populated neighbourhood in which they had fixed their abode, and first two of his three children took it, and died; and then himself and his wife—rendered meet subjects for infection by anxiety of mind and poor living—were attacked with the disease. He recovered; at least he survived, though with an enfeebled constitution, but he lost his wife, a wise and patient woman, who had been his comforter and sustainer through all his misfortunes—misfortunes which, after vainly endeavouring to avert, she supported with heroic and uncomplaining fortitude; but dying, she left him a precious legacy in Mary, who, with a fine nature, and the benefit of her mother's precept and example, had been to him ever since a treasure of filial duty and tenderness.

A faint light dawned through the dirty window on the morning succeeding the little event with which we opened our story, when Mary rose softly from her humble couch, and stepping lightly to where her father's clothes lay on a chair, at the foot of his bed, she put her hand into his waistcoat-pocket, and, extracting therefrom the guinea which had been found in the gruel the preceding evening, she transferred it to her own. She then dressed herself, and having ascertained that her father still slept, she quietly left the room. The hour was yet so early, and the streets so deserted, that Mary almost trembled to find herself in them alone; but she was anxious to do what she considered her duty without the pain of contention. John Glegg was naturally an honest and well-intentioned man, but the weakness that had blasted his life adhered to him still. They were doubtless in terrible need of the guinea, and since it was not by any means certain that the real owner would be found, he saw no great harm in appropriating it; but Mary wasted no casuistry on the matter. That the money was not legitimately theirs, and that they had no right to retain it, was all she saw; and so seeing, she acted unhesitatingly on her convictions.

She had bought the meal at Mr Benjamin's, because her father complained of the quality of that she procured in the smaller shops, and on this occasion he had served her himself. From the earliness of the hour, however, though the shop was open, he was not in it when she arrived on her errand of restitution; but addressing Leah Leet, who was dusting the counter, she mentioned the circumstance, and tendered the guinea; which the other took and dropped into the till, without acknowledgment or remark. Now Mary had not restored the money with any view to praise or reward: the thought of either had not occurred to

her; but she was, nevertheless, pained by the dry, cold, thankless manner with which the restitution was accepted, and she felt that a little civility would not have been out of place on such an occasion.

She was thinking of this on her way back, when she observed Mr Benjamin on the opposite side of the street. The fact was, that he did not sleep at the shop, but in one of the suburbs of the metropolis, and he was now proceeding from his residence to Long Acre. When he caught her eye, he was standing still on the pavement, and looking, as it appeared, at her, so she dropped him a courtesy, and walked forwards; while the old man said to himself: 'That's the girl that got the guinea in her meal yesterday. I wonder if she has been to return it!'

It was Mary's pure, innocent, but dejected countenance, that had induced him to make her the subject of one of his most costly experiments. He thought if there was such a thing as honesty in the world, that it would find a fit refuge in that young bosom; and the early hour, and the direction in which she was coming, led him to hope that he might sing *Eureka* at last. When he entered the shop, Leah stood behind the counter, as usual, looking very staid and demure; but all she said was, 'Good-morning;' and when he inquired if anybody had been there, she quietly answered: 'No; nobody.'

Mr Benjamin was confirmed in his axiom; but he consoled himself with the idea, that as the girl was doubtless very poor, the guinea might be of some use to her. In the meantime, Mary was boiling the gruel for her father's breakfast, the only food she could afford him, till she got a few shillings that were owing to her for needle-work.

'Well, father, dear, how are you this morning?'

'I scarce know, Mary. I've been dreaming; and it was so like reality, that I can hardly believe yet it was a dream;' and his eyes wandered over the room, as if looking for something.

'What is it, father? Do you want your breakfast? It will be ready in five minutes.'

'I've been dreaming of a roast fowl and a glass of Scotch ale, Mary. I thought you came in with the fowl, and a bottle in your hand, and said: "See, father, this is what I've bought with the guinea we found in the meal!"'

'But I couldn't do that, father, you know. It wouldn't have been honest to spend other people's money.'

'Nonsense!' answered John. 'Whose money is it, I should like to know? What belongs to no one, we may as well claim as anybody else.'

'But it must belong to somebody; and, as I knew it was not ours, I've carried it back to Mr Benjamin.'

'You have?' said Glegg, sitting up in bed.

'Yes, I have, father. Don't be angry. I'm sure you won't when you think better of it.'

But John was very angry indeed. He was dreadfully disappointed at losing the delicacies that his sick appetite hungered for, and which, he fancied, would do more to restore him than all the doctors' stuff in London; and, so far, he was perhaps right. He bitterly reproached Mary for want of sympathy with his sufferings, and was peevish and cross all day. At night, however, his better nature regained the ascendancy; and when he saw the poor girl wipe the tears from her eyes, as her nimble needle flew through the seams of a shirt she was making for a cheap warehouse in the Strand, his heart relented, and, holding out his hand, he drew her fondly towards him.

'You're right, Mary,' he said, 'and I'm wrong; but I'm not myself with this long illness, and I often think if I had good food I should get well, and be able to do something for myself. It falls hard upon you, my girl; and often when I see you slaving to support my useless life, I wish I was dead and out of the way; and then

you could do very well for yourself, and I think that pretty face of yours would get you a husband perhaps.' And Mary flung her arms about his neck, and told him how willing she was to work for him, and how forlorn she should be without him, and desired she might never hear any more of such wicked wishes. Still, she had an ardent desire to give him the fowl and the ale he had longed for, for his next Sunday's dinner; but, alas! she could not compass it. But on that very Sunday, the one that succeeded these little events, Leah Leet appeared with a smart new bonnet and gown, at a tea-party given by Mr Benjamin to three or four of his intimate friends. He was in the habit of giving such small inexpensive entertainments, and he made it a point to invite Leah; partly because she made the tea for him, and partly because he wished to keep her out of other society, lest she should get married and leave him—a thing he much deprecated on all accounts. She was accustomed to his business, he was accustomed to her, and, above all, she was so honest!

But there are various kinds of honesty. Mary Glegg's was of the pure sort; it was such as nature and her mother had instilled into her: it was the honesty of high principle. But Leah was honest, because she had been taught that honesty is the best policy; and as she had her living to earn, it was extremely necessary that she should be guided by the axiom, or she might come to poverty and want bread, like others she saw, who lost good situations from failing in this particular.

Now, after all, this is but a sandy foundation for honesty; because a person who is not actuated by a higher motive, will naturally have no objection to a little peculation in a safe way—that is, when they think there is no possible chance of being found out. In short, such honesty is but a counterfeit, and, like all counterfeits, it will not stand the wear and tear of the genuine article. Such, however, was Leah's, who had been bred up by worldly-wise teachers, who neither taught nor knew any better. Entirely ignorant of Mr Benjamin's eccentric method of seeking, what two thousand years ago Diogenes thought it worth while to look for with a lantern, she considered that the guinea brought back by Mary was a waif, which might be appropriated without the smallest danger of being called to account for it. It had probably, she thought, been dropped into the meal-tub by some careless customer, who would not know how he had lost it; and, even if it were her master's, he must also be quite ignorant of the accident that had placed it where it was found. The girl was a stranger in the shop; she had never been there till the day before, and might never be there again; and, if she were, it was not likely she would speak to Mr Benjamin. So there could be no risk, as far as she could see; and the money came just apropos to purchase some new attire that the change of season rendered desirable.

Many of us now alive can remember the beginning of what is called the sanitary movement, previous to which era, as nothing was said about the wretched dwellings of the poor, nobody thought of them, nor were the ill consequences of their dirty, crowded rooms, and bad ventilation at all appreciated. At length the idea struck somebody, who wrote a pamphlet about it, which the public did not read; but as the author sent it to the newspaper editors, they borrowed the hint, and took up the subject, the importance of which, by slow degrees, penetrated the London mind. Now, amongst the sources of wealth possessed by Mr Benjamin were a great many houses, which, by having money at his command, he had bought cheap from those who could not afford to wait; and many of these were situated in squalid neighbourhoods, and were inhabited by miserably poor people; but as these people did not fall under his eye, he had never thought of them—he had only thought of their rents, which he

received with more or less regularity through the hands of his agent. The sums due, however, were often deficient, for sometimes the tenants were unable to pay them, because they were so sick they could not work; and sometimes they died, leaving nothing behind them to seize for their debts. Mr Benjamin had looked upon this evil as irremediable; but when he heard of the sanitary movement, it occurred to him, that if he did something towards rendering his property more eligible and wholesome, he might let his rooms to a better class of tenants, and that greater certainty of payment, together with a little higher rent, would remunerate him for the expense of the cleaning and repairs. The idea being agreeable both to his love of gain and his benevolence, he summoned his builder, and proposed that he should accompany him over these tenements, in order that they might agree as to what should be done, and calculate the outlay; and the house inhabited by Glegg and his daughter happening to be one of them, the old gentleman, in the natural course of events, found himself paying an unexpected visit to the unconscious subject of his last experiment; for the last it was, and so it was likely to remain, though three months had elapsed since he made it; but its ill success had discouraged him. There was something about Mary that so evidently distinguished her from his usual customers; she looked so innocent, so modest, and withal so pretty, that he thought if he failed with her, he was not likely to succeed with anybody else.

'Who lives in the attic?' he inquired of Mr Harker, the builder, as they were ascending the stairs.

'There's a widow and her daughter and son-in-law, with three children, in the back-room,' answered Mr Harker. 'I believe the women go out charring, and the man's a bricklayer. In the front, there's a man called Glegg and his daughter. I fancy they're people that have been better off at some time of their lives. He has been a tradesman—a cooper, he tells me; but things went badly with him; and since he came here, his wife died of the fever, and he's been so weakly ever since he had it, that he can earn nothing. His daughter lives by her needle.'

Mary was out; she had gone to take home some work, in hopes of getting immediate payment for it. A couple of shillings would purchase them coal and food, and they were much in need of both. John was sitting by the scanty fire, with his daughter's shawl over his shoulders, looking wan, wasted, and desponding.

'Mr Benjamin, the landlord, Mr Glegg,' said Harker.

John knew they owed a little rent, and was afraid they had come to demand it. 'I'm sorry my daughter's out, gentlemen,' he said. 'Will you be pleased to take a chair?'

'Mr Benjamin is going round his property,' said Harker. 'He is proposing to make a few repairs, and do a little painting and whitewashing, to make the rooms more airy and comfortable.'

'That will be a good thing, sir,' answered Glegg—'a very good thing; for I believe it is the closeness of the place that makes us country folks ill when we come to London. I'm sure I've never had a day's health since I've lived here.'

'You've been very unlucky, indeed, Mr Glegg,' said Harker. 'But you know, if we lay out money, we shall look for a return. We must raise your rent.'

'Ah, sir, I suppose so,' answered John with a sigh; and how we're to pay it, I don't know. If I could only get well, I shouldn't mind; for I'd rather break stones on the road, or sweep a crossing, than see my poor girl slaving from morning to night for such a pittance.'

'If we were to throw down this partition, and open another window here,' said Harker to Mr Benjamin, 'it would make a comfortable apartment of it. There would be room, then, for a bed in the recess.'

Mr Benjamin, however, was at that moment engaged in the contemplation of an ill-painted portrait of a girl, that was attached by a pin over the chimney-piece. It was without a frame, for the respectable gilt one that had formerly encircled it, had been taken off, and sold to buy bread. Nothing could be coarser than the execution of the thing, but as is not unfrequently the case with such productions, the likeness was striking; and Mr Benjamin, being now in the habit of seeing Mary, who bought all the meal they used at his shop, recognised it at once.

'That's your daughter, is it?' he said.

'Yes, sir; she's often at your place for meal; and if it wasn't too great a liberty, I would ask you, sir, if you thought you could help her to some sort of employment that's better than sewing; for it's a hard life, sir, in this close place for a young creature that was brought up in the free country air: not that Mary minds work, but the worst is, there's so little to be got by the needle, and it's such close confinement.'

Mr Benjamin's mind, during this address of poor Glegg's, was running on his guinea. He felt a distrust of her honesty—or rather of the honesty of both father and daughter; and yet being far from a hard-hearted person, their evident distress and the man's sickness disposed him to make allowance for them. 'They couldn't know that the money belonged to me,' thought he; adding aloud: 'Have you no friends here in London?'

'No, sir, none. I was unfortunate in business in the country, and came here hoping for better luck; but sickness overtook us, and we've never been able to do any good. But, Mary, my daughter, doesn't want for education, sir; and a more honest girl never lived!'

'Honest, is she?' said Mr Benjamin, looking Glegg in the face.

'I'll answer for her, sir,' answered John, who thought the old gentleman was going to assist her to a situation. 'You'll excuse me mentioning it, sir; but perhaps it isn't everybody, distressed as we were, that would have carried back that money she found in the meal: but Mary would do it, even when I said that perhaps it wasn't yours, and that nobody might know whose it was; which was very wrong of me, no doubt; but one's mind gets weakened by illness and want, and I couldn't help thinking of the food it would buy us; but Mary wouldn't hear of it. I'm sure you might trust Mary with untold gold, sir; and it would be a real charity to help her to a situation, if you knew of such a thing.'

Little deemed Leah that morning, as she handed Mary her quart of meal and the change for her hard-earned shilling, that she had spoiled her own fortunes, and that she would, ere night, be called upon to abdicate her stool behind the counter in favour of that humble customer; and yet so it was. Mr Benjamin could not forgive her dereliction from honesty; and the more he had trusted her, the greater was the shock to his confidence. Moreover, his short-sighted views of human nature, and his incapacity for comprehending its infinite shades and varieties, caused him to extend his ill opinion farther than the delinquent merited. In spite of her protestations, he could not believe that this was her first misdemeanour; but concluded that, like many other people in the world, she had only been reputed honest because she had not been found out. Leah soon found herself in the very dilemma she had deprecated, and the apprehension of which had kept her so long practically honest—without a situation, and with a damaged character.

As Mary understood book-keeping, the duties of her new office were soon learned, and the only evil attending it was, that she could not take care of her father. But determined not to lose her, Mr Benjamin found means to reconcile the difficulty by giving them a room behind the shop, where they lived very comfortably,

till Glegg, recovering some portion of health, was able to work a little at his trade.

In process of time, however, as infirmity began to disable Mr Benjamin for the daily walk from his residence to his shop, he left the whole management of the business to the father and daughter, receiving every shilling of the profits, except the moderate salaries he gave them, which were sufficient to furnish them with all the necessaries of life, though nothing beyond. But when the old gentleman died, and his will was opened, it was found that he had left everything he possessed to Mary Glegg; except one guinea, which, without alleging any reason, he bequeathed to Leah Leet.

DECIMAL SYSTEM OF COINAGE.

THE pounds, shillings, and pence which served for the simple reckonings of our fathers, have entailed upon us a highly complicated system of accounts since we have become a great commercial people. Steam-engines, locomotives, and electric telegraphs have multiplied our transactions a hundredfold, but no adequate labour-saving machinery has been introduced into the counting-house, where the value of these transactions has to be recorded and adjusted. The simple and scientific method of computation by what is called the decimal system, is used at this moment, we are told, by more than half the human race. Not only has it been by law established in most of the countries of Europe, but throughout the great empires of China and Russia; it is penetrating the Ottoman Empire; it has obtained a footing in Persia and Egypt; and it is universal in the United States of America, whence it has made its way into several other transatlantic states. Among ourselves, the thing is approved and admired in the abstract, but we dread the trouble it would give us to fall into a method to which we are unaccustomed; and we apprehend, on very insufficient grounds, that much confusion would arise during the transition. Moreover, it is to be feared that out of a spirit of prejudice or contradiction, many would not, even under the penalties of law, adopt the change. At this moment, as is well known, certain classes of people persist in selling corn and other articles by old local measures, although at the risk of prosecution. Thus, in Scotland, we still hear of firloths, bolls, and mutchkins, notwithstanding that these antiquated measures were abolished upwards of twenty years ago. In short, it would appear that the change of popular denominations in weights, measures, and moneys, is one of the things which the law, in ordinary circumstances, has great difficulty in reaching.

This difficulty, however, ought not to be deemed insuperable. The boon given to society by the decimal system is worth struggling for. On this account, it appears highly desirable that the people at large should be made thoroughly acquainted with its principles, and be able to weigh the advantages against the difficulties of such a change. Some years ago, the subject was pretty fully discussed in several literary and commercial periodicals; and recently, Mr Taylor's little work* has presented it in a more permanent form. Our own pages appear particularly suitable for giving wide circulation to a familiar and popular exposition of the subject.

The ancients used certain letters to represent numbers, and we still employ the Roman numeral characters as the most elegant way of expressing a date in typography or sculpture; but every one must

see what a tedious business the calculation of large sums would be according to this cumbrous system of notation: nor is it easy to say whereabouts our commercial status, to say nothing of science, would have been to-day, had it never been superseded. The Romans themselves, in computing large numbers, always had recourse to the abacus—a counting-frame with balls on parallel wires, somewhat similar to that now used in infant-schools.

It was a great step gained, and a most important preparation for clearing away the darkness of the middle ages by the light of science, when between the eighth and thirteenth centuries the use of the characters 1, 2, 8, &c. was generally established in Europe, having been received from Eastern nations, long accustomed to scientific computations. The great advantage of these numbers is, that they proceed on the decimal system—that is, they denote different values according to their relative places, each character signifying ten times more accordingly as it occupies a place higher. Thus 8, in the first place to the right, is simply 8; but in the next to the left, it is 80; in the third, 800; and in the fourth, 8000. Yet we do not require to grasp these large numbers in our thought, but deal with each figure as a simple unit, and subject it to every arithmetical process without even adverting to its real value. To some, it may seem superfluous to explain a matter so familiar; but we have met with many who know pretty well how to use our system of notation mechanically, yet do not know, or rather have not thought of the beautifully simple principle on which it proceeds—that of decimal ascension.

Now, we want to see the same principle applied to the gradations of our money, weights, and measures. Instead of our complicated denominations of money—namely, pounds, each containing twenty shillings, these each divisible into twelve pence, and these again into four farthings—we want a scale in which ten of each denomination would amount to one of that immediately above it, as in our notation. And instead of our complicated system of weights and measures, we want one similarly graduated system—each measure and weight rising ten times above the former. All calculations of prices would then be made by simple multiplication. What a gala-day for school-boys when the pence and shilling table would be abolished by act of parliament, and there would no longer be the table of avoirdupois-weight to learn, nor troy-weight, nor apothecaries', nor long-measure, nor square-measure, nor cloth-measure, nor liquid-measure, nor dry-measure, but one decimal scale of weights and measures would suffice for every commodity, and there would only be their names to get by heart in order! Every one sees that there would be an astonishing simplification in this system of reckoning by tens—that the study of arithmetic would be immensely facilitated, and the business of the counting-house divested of puzzling calculations. Let us see whereabouts we are in the way towards its attainment.

About ten years ago, a parliamentary commission on the subject of weights and measures, advised the adoption of a decimal scale, but recommended as a preliminary step, the decimation of the Coinage. Regarding it as important, however, that great deference should be paid to existing circumstances, and that the present relative notions of value, so deeply rooted in the public mind, should be disturbed as little as possible, they pointed out the facilities existing in our present coinage for a re-arrangement on the decimal plan. They said that the pound might be preserved precisely on the present footing, and thus would be maintained in name the price of everything above twenty shillings in value. They remarked that the farthing, which is the 960th part of L.1, might be set down as the 1000th, which would be a variation of 4 per cent. only—somewhat less than that to which

* The Decimal System; as applied to the Coinage and Weights and Measures of Great Britain. Groombridge and Sons: 1851.

copper is liable from fluctuation of price. We have thus the units at the one end of the scale, and the thousands at the other; it remains only to interpose the tens and hundreds between them, by introducing a florin as the tenth of a pound, and a cent—equal to $\frac{1}{20}$ of a shilling—equal to the tenth of the florin. Adopting these views, the following would be the new and simple scale of money—reckoning:—ten millets, 1 cent; ten cents, 1 florin; ten florins, L.1.

Nothing was done, however, in following up these recommendations, till the subject was brought before the House of Commons by Dr John Bowring, in 1847. The consequence of his appeal was, that a coin denominated a florin, and representing the tenth of a pound, was struck, and put in circulation. It was, however, considered 'an unfortunate specimen of Royal Mint art,' and the issue was discontinued, though a few specimens still linger unforbidden among us. The matter is thus at a stand-still, and may probably not be agitated again till the people generally are more impressed with its importance, and disposed to urge it on the legislature.

The first thing wanted is obviously an abundant issue of acceptable florins. No matter though the coin be recognised by the ignorant as a two-shilling piece, rather than as the tenth of a pound; it is a decimal coin with which they may become familiar without disturbing their old ideas and modes of reckoning. The single step that would then remain to be taken is the decisive one—the introduction of the coin equivalent to one-tenth of a florin, accompanied by the withdrawal of the representatives of duodecimal division, and a legislative enactment that all accounts kept in public offices, or rendered in private transactions, should be in the decimal denominations.

The only difficulty which has appalled the advocates of the decimal system, is with respect to the cent-piece. It is said to be too small for a silver coin, too large for a copper, and mixed metals find no favour at the Mint. But if it is to be a denomination in accounts, it must have a representative coin, and a silver cent could be very little smaller than our present 3d.-piece. 'The great mass of the people,' says Mr Norton (a correspondent of the *Athenæum* on this subject), 'will not adopt an abstraction; you must give them something which they can see, handle, and call by name, if you wish them to take notice of it in their reckonings.' Mr Taylor, and some other writers, have proposed to evade this difficulty by passing over the cents altogether, and counting only by pounds, florins, and millets. The French, say they, have in theory a decimally graduated scale, yet they always reckon by francs, and cents, which are 100ths of francs; the intervening decime being ignored in practice. So, likewise, the Americans have the dollar, the dime (its tenth part), the cent (its hundredth), and the mill (its thousandth). 'It is now nearly thirty years,' says Mr John Quincy Adams, in his report to Congress in 1821, 'since our new moneys of account have been established. The dollar and the cent have become familiarised to the tongue, but the dime and the mill are so utterly unknown; that now, when the recent coinage of dimes is alluded to, it is always necessary to inform the reader that they are ten-cent pieces. Ask a tradesman in any of our cities what is a dime or a mill, and the chances are four in five that he will not understand your question.' This, however, we cannot help considering one of the greatest inconveniences of transatlantic and continental reckonings. We are accustomed to talk of amounts in as small numbers as possible; and one of the great advantages we see in decimal gradations is, that we should never have a number above 9, except in pounds. There is something not only troublesome but indefinite, in the idea of ten and twenty in comparison with one and two; and a French account in francs bewilders us when it amounts to thousands and millions. Probably the half and

quarter francs of France, and the half and quarter dollars of America, have been the means of exploding the decimals next below them; and on this ground we differ from those who plead for the continuance of our present shillings and sixpences, as half and quarter florins. The shilling is a coin so inseparably connected with 12 and 20, that no decimal system will obtain while it exists. It is useless to say, that it would be retained only as a circulation coin, and not as a denomination in accounts; for so long as we have it at all, we will certainly reckon from it and by it. For purposes of common barter, there ought to be a two-cent piece, a four-cent, and perhaps a seven-cent; and thus we shall be compelled to *think decimally*. 'If it is worth while to alter at all,' says Mr Taylor, 'ought we not to go the whole required length, and aim without timidity at the possession of a scale complete at once within itself, and so escape an indefinite prolongation of the purgatory of transition? In a change like the one under consideration, the work of pulling down an old system is far more difficult than that of building up another, and every prop must be removed before it will fall.'

With respect to the copper coins, there seems to be no hurry about disturbing them. It appears that the Dutch stiver and the French sou have maintained their place in spite of legislation. So, probably, would the English penny, and properly enough as a 4-millet piece. We fear our poor people would feel it to be an attempt to mystify them, were the government to withdraw this familiar coin and substitute a 5-millet piece, as some have recommended, for the sake of establishing a binary division of the cent. It would, doubtless, be considered desirable, as an ulterior measure, to have a more exact copper coinage, marked as one millet, two millets, and four millets; but when we have, without scruple, passed as the twelfth part of a shilling the Irish penny, which is really only the thirteenth part, we may, in the meantime, use our present copper money, which will differ only a twenty-fifth from the new value attached to it—a discrepancy of no consequence, except to the holders of large quantities, from whom the Mint would be bound to receive it back at the value it bore when issued. These coppers, however, ought not to be used beyond the value of the cent, for then would arise the confusion of dealing with the 100 millets in the florin, or what would popularly be termed an odd half-penny in every shilling. For the same reason, the adjustment of prices, in order to be equitable, should be calculated downwards from the pound and florin, not upwards from the penny. Thus, if a labourer's wages have been 1s. 3d. a day, his employer must not say that 15 pence are 60 farthings—that is, 6 cents; but 1s. 3d. is five-eighths of a florin, which amount to about 6 cents 2 millets.

Such is the plan which has been officially laid down for a decimal coinage, and such the steps needful to carry it out. The only scheme we have seen which materially differs from it is that of Mr H. Norton. He selects for the highest denomination the half-sovereign, and proposes to call it a ducat. The shilling, as now in use, would then be the second denomination; the third, he proposes, should be a cent, equal to about $\frac{1}{14}$ of a penny, and which, he says, would be fairly represented by our large unmilled pennies, if newly christened; the fourth denomination to be a 'rap,' the tenth of the cent, and somewhat less than half a farthing. The great advantage adduced in favour of this scale is, that it would be much more likely than the other to secure general adoption. The removal of the pound, he says, affects chiefly the higher and educated classes; it leaves the shilling, which is the staple and standard for the masses, and also the penny, with slight alteration, accompanied by the utter removal of the old one. It is also said, that a half-farthing piece would be a great boon to the poor, especially in Ireland. The

circumstances alleged in recommendation of this scale, are just what appear to us to be its defects. The continuance of the poor man's penny would not appear a boon if he found there were to be only ten of them for a shilling; especially as many small articles, which were a penny before, would probably be a penny still, the dealers not finding it convenient to adjust the fraction. We well remember the dissatisfaction of the poorer classes in Ireland at the equalisation of the currency in 1825. Hitherto, the native silver coins had been 5d. and 10d. pieces, a British shilling had been a thirteen-penny, and a half-crown, 2s. 8½d. This half-crown was the usual breakfast-money of gentlemen's servants—that is, their weekly allowance for purchasing everything except dinner. When the servant now went to the huckster's, and got, as heretofore, 6d. worth of bread, 9d. worth of tea, 4d. worth of sugar, and 5d. worth of butter, there was only 6d. of change to buy another loaf in the middle of the week, instead of 8½d., which was wont to afford, we will not say what, over and above. It is for a similar reason that we say, if there remain anything which can be either identified or confounded with a penny, it should be lowered rather than raised in value. Small prices are not easily adjusted, and the temptation in the other case lies on the side of the dealer not to alter them. It is more certain, for instance, that a baker will take care to divide 2s. worth of bread into twenty-five penny-loaves, when a penny comes to be the twenty-fifth of a florin, than that he will divide 1s. worth into ten only, if a penny become the tenth of a shilling. And it would be less hardship for the poor housekeeper to find her penny-loaf 1-25th smaller, if she could discern the reduction, than to get only ten for her shilling, even if they were a fifth larger. Besides, we should feel it to be a poverty-stricken thought, that our internal commerce should be reduced to barter in half-farthings' worths, and that our merchants and bankers should have no denomination above the value of 10s. for the enormous sums which figure in their books.

The subject of names is worth a remark or two. The commissioners recommended 'florins,' as affording facilities to foreigners for understanding our monetary system; and in this respect it has advantages. 'Cent' and 'millet' are easily enunciated, and they convey to the educated classes, whether at home or abroad, the relative value of the coins. We cannot say, however, but we would prefer a more familiar nomenclature than florins, cents, and millets. Mr Norton's suggestion, that the names should not only be capable of easy and rapid utterance, but that they should be of the same Teutonic origin as our shilling and penny, is worthy of serious consideration. Dr Bowring, who advocated a strictly decimal scale, suggested the names, 'queens' and 'victorias' for the two middle denominations, leaving pounds and farthings as they were. Now, if it be deemed proper to change the name of the unfortunate florin when it makes its reappearance, 'queen' would be a very pretty substitute; but 'victoria' would soon be mangled down to its first syllable. If this style of nomenclature be preferred, 'prince' would be a more suitable name for the little cent-piece. Mr De Morgan is for 'pounds, royals, groats, and farthings.' But 'royal' is not capable of rapid enunciation, and 'groat' is decidedly objectionable for designating ten farthings, as it is still sacred to fourpence in the English mind. Whatever the names, the full enunciation of them at first would appear stiff and solemn; but abbreviated modes of expression would soon be established. 'Four-two' would be understood as L.4, 2 (florins), while 'four and two' would convey four florins, two cents. When three denominations were used, it would be 'four-three-two,' there being little danger of a misunderstanding as to whether the 'four' were pounds or florins. So, in writing, it would only be necessary to write after any sum the name of the lowest denomination,

as 48, 3, 7c., which would be known as L.48, 3 florins, 7 cents; or, to add ciphers for all lower denominations, as 48300, which, whether pointed or not, would convey L.48, 3, 0, 0.

In a future paper, we will resume the subject of decimals, viewing it with reference to weights and measures; when its advantages will more fully appear, by the facility it affords for the calculation of prices.

WHY THE SCOTCH DO NOT SHUT THE DOOR.

NATIONS have curious and almost unaccountable peculiarities. One interlards conversation with shrugs, and another with expectoration; and a third, by way of indicating satisfaction, rubs its hands. The Scotch have a peculiarity of their own. When they quit a room, they do not shut the door, but merely draw it gently after them, so as to leave it unlatched. Some individuals may not be strictly attached to this practice; but on the whole the Scotch may, for the sake of distinction, be said to be an anti-door-shutting nation. Now, why such should be the case, becomes an interesting philosophical problem.

Much consideration have we spent in pondering on this national oddity, and are free to admit that the conclusions arrived at are not so satisfactory as could be wished. Nevertheless, in default of any better explanation of the phenomenon, what we have to say may possibly carry a degree of weight.

The reason why the Scotch do not shut the door is, as we imagine, highly characteristic. It is not that they are ignorant of the important fact, that doors are made for shutting. They are fully aware that latches are not mere ornamental attributes of doors—things stuck on not to be used. And it cannot be imputed to them, that they leave doors open for the sake of ventilation. In short, if strangers were to guess for a hundred years, they would fail to hit upon the real, true, and particular reason why the Scotch do not shut the door. One would naturally think, that as the act of shutting the door is the prerogative of the person who quits an apartment, it would not by so mindful a people be neglected. And neither it is. There is no neglect in the matter. The Scotch take a profound view of the subject. They institute a rigorous comparison between shutting and not shutting. True, they are not taught to do so, any more than Frenchmen are taught to make gestures. It is in them. They are born with a natural proneness to consider, as if it were a question of algebraic quantities, whether the satisfaction they might impart by shutting the door would not be more than counterbalanced by the dissatisfaction that might accrue from distinctly and unmistakably shutting it. Still, it seems strange how any displeasure could be incurred by the performance of what all the rest of mankind believe to be a mark of good-breeding. Strange, indeed! But it surely will be observed, that much depends on making a principle of a thing. And with respect to good-breeding, what if it can be placed in a double point of sight? It may be the etiquette in some countries to shut the door; but that proves nothing. In Europe, men uncover their heads on entering the presence of the great; in the East, they uncover the feet. Fashions are local. When the Scotch do not shut the door, they act conscientiously, according to ancient national usage. We may be certain that they have deliberately, arithmetically, and cautiously, weighed the question of shutting in its various and delicate bearings; and arrived at the clear conviction that, all things considered, it would be better not to shut!

Of course, the Scotch having, by innate logic, attained to a principle, they adhere to it as a thing which neither argument nor railery can upset. They have very properly resolved not to be reasoned, nor laughed, nor

edgelled out of their opinion. The door ought not to be shut! That is a truth as effectually demonstrated as any truth in mathematics; and such being the case, they will die rather than yield the point. Let it be understood, therefore, that in these observations we aim not in the slightest degree at proselytising our northern friends. They are a nation of anti-door-shutters, and that, on principle, they will remain to the end of the chapter.

It may, at the same time, be mentioned, that this acute people have no special objection to seeing a door shut, provided anybody else does it. Their principles apply only to shutting by their own hand. What might be very wrong in them, while quitting an apartment, would be proper enough for him who remains. He may rise and shut the door, if he feels inclined. It is his affair. Strictly speaking, he should appreciate the delicacy of feeling which has gracefully left the performance of this simple act to his own discretion. Yes, it is in this fine instance of steady principle that we see a discrimination of politeness exquisitely ingenious and beautiful. The English have the reputation of being a blunt, downright people; and their practice of shutting the door after them makes it certain they are so. When they draw to the door, turn the handle, and hear the latch click, they as good as say: 'There, the door is shut; the thing is done. I leave no doubt on the subject; I care not what you think of me; I have done my duty.' This is England all over—great, uncalculating, independent-minded England! The Scotch almost pity this daring recklessness of character. They are astonished at its boldness. It is action resting on no proper grounds. How differently they proceed! Treating it as belonging to the science of numbers, the following becomes the method of stating the question:—

Given that there is a door which may or may not be shut on quitting an apartment, let it be shewn by the rules of arithmetic whether it would be preferable to shut the said door or leave it open. Write down, first, the arguments for not shutting, according to their supposed value; then do the same for the arguments *per contra*; lastly, sum up both, and strike the balance. Thus—

FOR NOT SHUTTING.

Because the door is apt to slam, which would be exceedingly unpleasant, and might suggest the idea that you went out in a passion—valued as	4
If it did not slam, it might still make a creaking noise—valued as	2
Supposing it to make no noise at all, the impression is conveyed that you are going away never to return, whereas you have no such intention.	1
Chances of your causing a noise to disturb the company on opening the door when you return.	2
Probable loss of character by conveying the notion, that you are peremptory and abrupt in manners.	3
Giving the parties remaining the option of shutting or not, as suits their fancy.	2
That by leaving the door open, you do not commit yourself to a determinate act,	2
	16

FOR SHUTTING.

That a cold wind may not blow into the room; but this not probable, for it will be easy for those remaining in the apartment to rise and shut the door themselves.	1
That by a faint possibility you may give offence by leaving the door open.	1
That you may prevent persons outside overhearing what is said; this of small account, for people should not speak about things they do not wish to be repeated,	1
	3

Deducting 3 from 16, 13 remain. Result—balance of 13-19ths in favour of not shutting the door. Nothing, therefore, could be more clearly demonstrated than that the Scotch are strongly justified in leaving the door open when they quit an apartment. Doubts, indeed, may be entertained as to the values arbitrarily put on the respective items in the account: but to venture into this remote part of the inquiry would be to plunge us into the depths of metaphysics. Even supposing we were to make the matter as clear as the sun at noonday, there would still be sceptics. On shewing the above arithmetical calculation, for example, to an English lady, who has for a number of years studied Scotch character and manners, she, with a degree of bluntness that was exceedingly startling, gave it as her unqualified opinion, that the whole thing was a piece of nonsense; and that the only reason, as far as she could observe, why the Scotch do not shut the door, is that they have never been taught that it is consistent with good-manners to do so. The audacity of some people is really wonderful!

EDFOU AND ITS NEIGHBOURHOOD.

THERE is something extremely pleasant in the general regularity with which the picture of Egypt unfolds itself on either hand like a double panorama as you descend the Nile. When moving in the opposite direction, against the perpetual current, you are sometimes compelled to creep slowly on, tugged by a tight-strained rope at the rate of seven or eight miles a day; whilst anon a wind rises unexpectedly, and carries you with bewildering speed through forty or fifty miles of scenery. But the masts being taken down, and the sails folded for the rest of the voyage, and the oars put out, you begin to calculate with tolerable certainty on the rate of progress; for though violent contrary winds do frequently blow during part of a day, it is almost always possible to make up for lost time in the hours that neighbour on sunset before and after. Well-seasoned Nile-travellers confirm our experience; and as we had rowed and floated within a calculated time from Assouan to Ombos, and from Ombos to Silsilis, so did we proceed to Edfou, and to the stations beyond, with few exceptions of obstinately adverse weather.

True, some portions of the view are missed during the hours of night-travelling; but these have most probably been seen during the ascent. Besides, though the scenery of the Nile is certainly not monotonous enough to weary the eye, yet there is a general sameness in its details, a want of those bold, original features which in other countries stamp the character of particular localities. Two parallel lines of mountains ever within sight of each other, now advancing towards the river through a sea of verdure in promontories, always nearly with the same level outline, now receding in semicircular sweeps; a narrow flat plain, loaded with crops and palm-groves, and intersected by canals and dikes, sometimes equally divided by a tortuous stream of vast breadth, but sometimes thrown, as it were, all to one side, east or west; occasionally a long line of precipices descending sheer into the very water; once only a regular defile with rocks on either hand; islands in the river, sandbanks, broad, winding reaches—such, in a few words, is a description of Egypt. It is the variety of colour produced by that mighty painter, the sun, that gives all the beauty to the landscape; and of this it is almost impossible to convey an idea. The chaste loveliness of the dawn, the majestic splendour of noon, and the marvellous glories of the sunset-hour—the

thousand hues that glow and tremble, and melt and mingle around through all the scenes of this great drama of light—words have not yet been invented to describe.

And then the night! Who can sit down and recall and count over the impressions which fly like a troop of fairies over the thrilling senses at that mystic hour, when the skirts of retiring day have ceased to flutter above the western hills, and the moon casts down her pale, melancholy glances on the silent scene, and the stars—our guardian angels, according to some—seem to stoop nearer and nearer to the earth as slumber deepens, as if to press golden kisses upon the eyelids of those whom they watch and love! In all countries these hours are beautiful; but in Egypt—let those who doubt come and witness all that we beheld, and which is indescribable, on the evening that we left the neighbourhood of Silailis on our way to Edfou—on that calm, placid river, over which brooded a silence interrupted only by the alternate songs of the crews of the two boats as they leisurely pulled with the current.

It was late in the afternoon of next day when we reached the landing-place; but we immediately set out to see the ruin, if ruin it can be called, for it is almost in perfect preservation. After traversing a broad extent of ground covered with rank grass and prickly plants, we came to the customary palm-grove, and then entered what romancers would probably call the 'good city' of Edfou. It is a considerable collection of huts, principally constructed of mud, clustering amidst mounds of rubbish at the base of the temple. The lofty propylæa, above a hundred feet high, I believe, were of course seen from far off, both during our walk and in ascending and descending the river. As is the case in nearly all other Egyptian buildings, the effect at a distance is anything but picturesque. From want of objects of comparison, the impression of great size is not produced; and nothing can be meaner in outline than two towers like truncated pyramids, pierced with small, square windows at irregular intervals. On a nearer approach, however, the surface-ornament begins to appear; and the central doorway, overhung by a rich and painted cornice, presents itself in its really grand proportions, but crushed, as it were, by the vast size of the twin towers, which now seem magnified into mountains. At Edfou the effect of this surprise is partly injured by the circumstances: first, the accumulation of huts through which you approach; and second, that of mounds of dirt which have risen nearly to the height of the doorway. However, when you come to the summit of these mounds, almost on a level with the lintel, and look down between the enormous jambs into a kind of valley formed by the great court, with its wonderful portico and belt of columns, it is difficult to conceive a more imposing scene.

The walls on all sides were covered with gigantic figures, quite wonderful to behold in their serene ugliness; but awakening no more human sympathy than the singular figures we saw on the Chinese-patterned plate stuck over the doorway in Nubia. The exaggeration that is usually indulged in with reference to Egyptian art is such, that if we were to attempt to describe these sculptured ornaments according to our own impressions, we should run the risk of being accused of caricature. We do not mean on this temple only, but on all the temples of Egypt. Now and then

a face of beautiful expression, though still with heavy features, is met with; but in general both countenance and figure are flat, out of proportion, and stiff in drawing, whilst the highest effort of colouring consists of one uniform layer, without tints or gradation. Perhaps amidst the many thousand subjects found in tombs and temples between Philæ and Cairo, one or two may be treated with nearly as much skill as was exhibited by the Italian painters before the time of Cimabue—except that scarcely an attempt even is made at grouping or composition. Nor must it be supposed that the Egyptian school was in course of development. They seem to have arrived at the highest excellence of which their intellect was capable. Their outlines, though in general excessively mean, are very firmly drawn; and they represent details with a laborious ingenuity worthy of the Chinese. Some enthusiastic antiquarians describe with great animation the scenes of public and domestic life which occur in such profusion; and, book in hand, we have admired and wondered at—not the genius of the artists, but that of their historians. How, in fact, do the Egyptians really proceed? They want to represent a hunt, for example: so they sketch a man with his legs extended like compasses, armed with a huge bow, from which he is in the act of discharging a monstrous arrow. Then close by they draw, without any attempt at perspective, a square enclosure, in which they set down higgledy-piggledy a variety of animals, some of them sufficiently like nature to allow their species to be guessed at. In one corner, perhaps, is a sprig of something intended for a tree, and intimating that all this is supposed to take place in a wood. This hieroglyphical or algebraical method of 'taking off' the occurrences of human life is applied with almost unvarying uniformity. Such was high art among the Egyptians; whom it is now the fashion to cry up at the expense of those impertinent Grecians, who presumed to arrive at excellence, almost at perfection, in so many departments.

However, the vast size of the figures on the front of the propylæa of Edfou does certainly, in spite of their awkwardness, produce an imposing effect, especially at the time we first beheld them, when the gray twilight had descended upon the earth, and night was already thickening beneath the heavy portico. We walked, or rather slid, down into the great court. It was surrounded with massive columns loaded with ornament, and looked grave in the extreme, in spite of the heaps of rubbish that encumbered it, and enabled us to ascend to the summit of the colonnade at one corner. The architecture of the Egyptians was certainly sublime. Their style anticipated and surpassed the Gothic in majesty, though certainly not in beauty. Their massive walls, Cyclopean columns, dim porticos, gloomy chambers, produce even now all the terrific impressions they could have desired. Perhaps the crumbling ruins which encumber the roof, the wretched remains of Christian buildings once erected on this temple as on a rock for security, rather heighten than diminish its effect. We walked round a vast wall still in perfect preservation, which encircles the windowless parallelogram formed by the temple, and reaches about half its height, leaving a narrow court like a moat all round; and we felt that these religious edifices had been fortresses likewise, and that temporal as well as spiritual terrors had of yore surrounded them. When shall we be able to wring forth the secret of that ancient time? When will its history cease to be a myth, its kings become real personages, its civilisation something better than a romance? As yet, nothing has been discovered except a string of disjointed facts, which scholars arrange each after his own fashion, and which no more resemble any other known series of

human actions than the accidental combination of the kaleidoscope does this living and breathing world. We want a key, and a key has not been found. So men go stumbling on through the inextricable labyrinth, and exhaust more ingenuity in vain speculations than would suffice to bring a variety of modern sciences to perfection.

It was perfectly safe to indulge in these thoughts, because even if any mighty antiquary had been at hand, he would have been obliged to confess that although some truth may have been brought to light, it is impossible to put one's finger upon it. For almost all men who have studied Egyptian antiquities differ entirely in their conclusions—all arrange dynasties in a different manner, and find more mistakes than discoveries in their predecessors. Well, thought we, let us leave them to their researches: if they do not find the pot of gold, they may cultivate the ground. For our part, we will hasten on to where yon pale gleam of yellow light is pouring between the propylæa and the body of the temple over the court-yard upon an enormous mountain of rubbish. It was the moon that had risen—not to enlighten the scene, but to render it more dim and mysterious, more full of strange shadows and illusions. On such occasions it is difficult even for the least imaginative to check a thought of what that pale, thoughtful-looking orb, which has watched the changing aspects of this scene for so many thousand years, could tell if it had a tongue! We gazed inquiringly at it; but as it rose higher and higher, and poured down more light on all objects around, it seemed to smile at our inquisitiveness, and to bid us turn less eager glances towards the dust and rubbish of old times, where perchance we may find a precious stone, perchance a bit of broken glass—but bend our eyes more steadfastly to the future, the centuries unborn, the inevitable, though not yet created infinite.

Edfou is situated at a little distance inland on the western bank of the Nile. As usual, the land in the neighbourhood of the river is high in comparison with that which is beyond—that is to say, there is a continual descending slope to the edge of the desert, where at this time of year there is, as it were, a succession of large ponds, water-channels, and marshes. It is impossible to reach the desert except by a long, elevated, tortuous dike, which begins near the town and terminates near the foot of a spur of the Libyan chain, some three or four miles distant. By the aid of the telescope we could distinguish in the niches of the rock a variety of dark spots resembling the entrances of grottoes; and, hearing that others had made the same observation, though without undertaking the fatigue of a visit, we determined to set out next morning, and combine a little sporting with antiquity-hunting.

Though the sun was not very high, it was sufficiently warm when we started, and we had good reason for anticipating a broiling ride. At this point there is not an atom of shade, not the semblance of a tree between the river and the stony desert. All the palm-groves cluster round the town of Edfou and the villages north and south. We were soon upon the dusty dike, which, as we proceeded, seemed to lift us higher and higher above the level plain, half bright-green, half sheeted with water, that lay in death-like repose, and reflected the sun's rays like a burnished mirror. It soon appeared that our anticipations of good sport were not to be disappointed: on all sides, as far as the eye could reach, as well as near at hand in the pools at the base of the *gisr* or dike, appeared innumerable birds, principally aquatic. Large flocks of paddy-birds, often called the white ibis, speckled the green of the fields; enormous pelicans stood hanging their enormous beaks, as if in drowsy contemplation, over distant pools; storks and herons, single, or arranged, as it were, in military array, accompanied them; and prodigious masses of white birds glittered in the sun on the verge

of the marshy plain. Then the water was alive with cormorants, geese, ducks, divers, teal, coot, that swam about in amazing numbers, or, startled at the slightest noise, flew generally at a cautious distance overhead. Birds of prey were of course likewise numerous—hawks, kites, vultures; and whole flights of large, black crows went by now and then, cawing vociferously. We could see also prodigious numbers of the *ghatta* or red-legged partridge flying northward or settling on the edge of the desert. It seemed as though a grand parliament of the feathered creation were about to be held.

When we reached the desert we found a small Coptic convent standing amidst the ruins of a much larger one near the head of the *gisr*. We visited it in the course of the morning, and were civilly received and conducted over the establishment. However, there was nothing particular to see. The grottoes we found to be of no interest whatever, being only a few feet deep, and containing neither sculptures nor inscriptions. At the base of the rocks were some oblong mouths of wells, but they were nearly filled with sand, so that, in an antiquarian point of view, we had reason to be disappointed. We passed some time on the plain, covered with *halfah*, a kind of coarse grass, to the north of the convent; succeeded in getting some partridges to add to our water-fowl; and returned in the afternoon with a donkey-load of game to the boat.

On the opposite side of the river there is some good ground for hare-shooting. We had been there before with success, and determined on a second visit. The scenery presented a curious contrast to that on the west bank—no dikes, no ponds, no marshy fields. The country extends from the bank in a high level plain, principally overgrown with halfah-grass, to the desert. Formerly there was scarcely any cultivation; all was abandoned to unprofitable thickets, that grew wild down to the river's margin. Now a good deal of *dhourra* is grown; and in January we saw the bright green blades of wheat coming up amongst the stubble. The castor-oil plant has been introduced, but as yet the unprofitable silk-tree and the wild bushes are far more common.

The change that has taken place is attributed to the fact, that a Frenchman, in the service of the pacha, has discovered coal-mines in the vicinity; and this is farther confirmed by the name bestowed on the mountains—Gebel et Fahm (Mountains of Coal.) But none of the valuable mineral has as yet made its appearance, and sceptics pretend that none ever will. We saw four or five large black heaps at a distance, and thought they might be the produce of the neighbourhood; but on drawing nigh they turned out to be charcoal manufactured in the desert, and brought down for sale by the Bedouins. There is a village of Ababde beneath the desert hills on the extreme verge of the plain; and the new cultivation seems entirely due to its inhabitants.

It was late in the evening when we this time came to the hare-ground; but we expected to take advantage of puss, as we had done once before, by moonlight. As we beat about among the bushes, myriads of drowsy sparrows, that had settled to rest on the boughs, rushed up with a tremendous noise, but sank down again almost instantaneously, to be once more disturbed. We started a few hares, but they glided away like shadows in the twilight, and we got no shots. Next morning we again tried our fortune; but it would appear as if the wary things had held a council of war, and decamped with bag and baggage. We found the sparrows lively and twittering, as though their night's rest had not been disturbed; hundreds of doves cooed securely on the boughs; and half a dozen mighty storks flew off from the midst of a dew-bespangled copse. But though we turned out the crews of two boats in default of dogs, not a hare shewed its ears; and we

gave up the search disappointed. It is remarked by old travellers on the Nile, that these animals constantly shift their quarters; not, indeed, in the course of a night, as we perhaps gratuitously supposed, but from season to season.

AN ENGLISH WORKMAN'S ACCOUNT OF A 'STRIKE' IN NEW YORK.

It was my second summer in New York: a residence of two years in that busy and enterprising city had enabled me to form juster views concerning the social policy of its inhabitants than those which had presented themselves to me on first landing; two years, if properly made use of, will serve to correct many fallacies, and to throw light on places and people. There is nothing like seeing with your own eyes, if you want really to know what the two latter are—whether they come up to your standard of comparison or otherwise. In several respects, chiefly material, I liked America better than England; the abundance and cheapness of provisions, for instance, and the ease with which fruits and other luxuries—to say nothing of books and newspapers—were procurable by the working-classes, presented, at that time at least, a striking contrast to the state of things in the 'old country.' I liked, too, at first, the sort of free-and-easy intercourse of the working-men with those, conventionally speaking, above them. Jack considered himself as good as his master, though not without occasional mortifications at not finding the sentiment reciprocated. The feeling, however, imparted a show of independence, rather captivating to one who was not a little imbued with 'old-country' radicalism. On the other hand, I had been astonished, not to say disconcerted, at finding—which I did more and more every day—how much mechanics are looked down upon in the United States. You have only to wear jacket and apron, and write yourself artisan, to be excluded from 'good' society as rigidly as if born under the caste-laws of India. Where there appears to be an equal chance for all to rise, those who have risen draw the line of demarcation with much greater severity than strangers are willing to believe.

Another point on which my notions were corrected was, that it was not so very easy to find work in New York as is commonly reported; and that, though wages were 20 per cent. higher than I had been accustomed to, the high price of clothing, lodging, &c. made it, notwithstanding, necessary for a man to be exceedingly careful of his expenditure, if he wished really to save money. There was no royal road to wealth on that side the Atlantic any more than on this.

Yet, among the facts which I liked, there was a set-off for this: it was the absence of those stupid trade-regulations which in England, and on the continent of Europe, hamper so annoyingly the movement of commerce, and complicate so vexatiously the relations between employers and employed. Few of these relics of feudal-age policy exist in the United States: a master takes as many apprentices as he pleases, perfectly regardless of anything his journeymen may think or say to the contrary. He believes, and not without reason, that while he pays them fair wages for their labour, they have no right to interfere with his mode of conducting his business. It was a relief to get clear of the traditional customs and usages of European workshops, and to feel that the way was clearer for rising out of the ranks. But there was one exception, in a large foundry and engine-factory into which I sometimes went to see an acquaintance: there the 'old-country' customs, as to drinking when new hands were taken on, prescribing coercive limitations, and so forth, were in full vigour. My shopmates were greatly amused one day by my account of what I had seen and heard in the factory, and our foreman exclaimed in language that would

have done credit to Sam Slick: 'Well! if them machinists aint the pigheadedest fellers I ever heerd tell of!—they must be Johnny Bulls!'

Such were some of my experiences of American life, and I was working on in my usual plodding way, when I found that there was still something to be learned. The journeymen cabinet-makers throughout the city took it into their heads that too great a share of the profits of trade went into the masters' pockets, and they determined, by demanding higher wages, to secure if possible an increased proportion for themselves. The masters being informed of the fact, maintained the contrary, and thereupon issue was joined. An 'old-price book' and a 'new-price book' came immediately to be talked about, with a fervour scarcely exceeded by that of the O. P. hostilities, well remembered by old playgoers in London; and among the men, a few ambitious spirits assumed the direction of affairs, and drew around them many willing helpers. Preliminary meetings were held to organise an opposition to the masters, and to take measures for the proper setting-forth and enforcement of the claims of the men, and the grounds on which the advance of wages was demanded. Deputations were appointed to wait on the employers, or 'bosses,' and shew reason why they should 'give in;' but the bosses would not give in, and declared themselves to be the best judges of their own business; that wages were as high as sale-prices would allow, and that a rise was out of the question. On hearing this, the men threatened a strike, to take place by a certain day, if their demands were not complied with.

From ten to twelve hands were employed in the shop where I worked—a rather heterogeneous assemblage. The foreman and one or two others were Americans, and the rest were Germans, French, and Irish—I being the only Englishman. Notwithstanding the diversity of nation, there was but little in sentiment, for with the exception of the apprentice, who was not a free agent, and myself, they all determined to 'turn out,' and many a taunt had I to bear for refusing to join them. Our boss was a man well to do in the world. Having of course heard of the threatened strike, he said: 'Well, you can do just as you like. There's no boss in the city pays better prices than I do, and they wout go up a cent the higher for all your striking.'

For my part, I was quite taken by surprise by the strike; it was the last thing I should have expected to see in America. But there it was, sure enough; and now that the boss had so unequivocally declared his sentiments, the shop became the more demonstrative in the expression of theirs. They were not going to be slaves for anybody; it was a free country; they had a right to higher wages, and higher wages they would have. The Britisher wasn't half a man; he was a sneak, who ought to have stayed in his own tyrannical country; and much more to the same effect. Consequently, on the day fixed, they just shewed themselves at the shop for a few minutes after breakfast, and then went off in a body to a great 'mass meeting,' called for the first day of the strike; and all the while emigrants from Europe were pouring into the city at the rate of ten or twelve hundred every week.

A first measure was to ascertain the numbers who had struck, how many were recusants, and in what shops they were working, with a view to devise means for procuring a total cessation of work in all the shops of the city. Advertisements of the proceedings speedily appeared in the daily papers, chiefly in those which, being sold at a cent apiece, circulated most largely among the working population. The masters were warned, that holding out on their part would be of little avail; and as for the 'misguided men' who persisted in working, they were invited to join the ranks of the insurgents, with promises of work at twelve

dollars a week, or the option of being stigmatised as unworthy members of society. Compared with the 'turn-outs,' the number of those who persisted in their labour was very small. As for myself, it seemed at first uncommonly dull to hear only the noise of my own tools, or of the apprentice's, echoing through the workshop. But the weather was fine; my 'job,' a 'secretary bookcase,' was one that I liked; and I kept on without a single misgiving as to the propriety of my determination.

After a few days spent in debates and discussions, and adjustment of differences between the old and new list of prices, deputations were sent round to all shops where the men had not joined the strike, and, among others, they visited me. For some reason—perhaps to avoid vexing the boss—they would not come up stairs, and requested me to meet them at the basement door. On going down, I saw some five or six well-dressed, intelligent-looking men—not a rare sight among the mechanics of New York—and then, they standing under the 'stoop,' and I leaning against a pile of maple-joists, one of them opened the business with a little dissertation on political and social economy, and the inherent right of men to band themselves together for the common good; after which, he inquired my reasons for continuing to work in opposition to the will of the majority. Those who have lived in America, and those only, will be able fully to comprehend the significance of these four words in italics. My answer was, that 'I had come to America to better myself, and could not afford to lose time.'

'But you need not lose time. There's a steam-boat fitting up down below at the dock; we can get you work on board of her at twelve dollars a week.'

'I don't know anything of steam-boat work; and if I did, it would not suit me to give up a steady place for one that must necessarily be uncertain.'

'You mean to say, then, that you will keep on working where you are?'

'I do.'

'You must be a fool to work for eight or nine dollars a week, when, by standing out, you could get twelve.'

'Not so sure of that; it is but a few who can make two dollars a day, and I am not one of them. Nine dollars is about a fair rate for what I can do.'

'That's no reason why you shouldn't try to better yourself by standing out. The bosses must give in, if all hands will only strike; and if it weren't for you European slaves and convicts, we'd soon carry our point.'

The term convict is a taunt frequently applied to Englishmen by working-people in the United States, and its introduction into the argument did not at all surprise me.

'I have little inclination,' I answered, 'to throw myself out of work just to enable you, and a dozen or two more, to get your twelve dollars a week. My first duty is, to take care of myself and my family. Our boss is a good fellow in the main, and I don't want to leave him; and, besides, there's another reason why I won't strike.'

'And what's that?'

'Because it won't succeed. You might as well try to stop the stream of the Hudson, as to keep up wages, while fifty or a hundred cabinet-makers are coming in every week from Germany, ready to work for twelve dollars a month.'

'That shews how much you know about it. In our great and free country, there's work for all Europe; so it's no use saying wages can't be kept up.'

'Whether or not,' I retorted, 'that's my opinion, and I shall stick to it till I find a better.'

On this, the opposite party delivered himself of a lengthy harangue, in which arguments were quoted from Adam Smith, De Tocqueville, and others, with considerable fluency; all intended, apparently, to convict

me of flagrant error, and prognosticate 'consequences.' I had not at that time read the works of these writers, and had only very youthful experience to oppose to such a weight of authority; and being, besides, one of those unfortunate individuals who cannot think of the right thing to say until twenty-four hours after the occasion has passed, I remained silent. My opponents mistook silence for assent, and left me, expressing a hope that they should see me at their committee-room next day.

The passage, at the entrance of which this scene had taken place, was separated from a turner's shop adjoining by a thin wooden partition, and the turner, who was a New Yorker, stopped his lathe to listen to our parley. When he heard me turn to go up stairs, he shouted: 'Hillo! Johnny Bull, they were rather too many for you. You must get up a little sooner in the mornin', if you want to circumvent Yankees! Look out for squalls, old fellow!'

'Words is only wind,' I replied, quoting one-half of a 'down-east' adage, as I ran up the stairs; he, however, before I got out of hearing, added the second half: 'but blows hurts.'

Three or four days passed away; trade was remarkably brisk, and a few of the bosses gave in—a fact announced with great exultation by the turn-outs, who now felt confident of victory, and urged their demands more strenuously than ever. But compliance was no part of the bosses' intentions, for no sooner were the arrears of unfinished work cleared off, than the hands found themselves again at liberty. This proceeding naturally irritated the struggle somewhat; and subscriptions for the support of those who, habituated to live from hand to mouth, had saved nothing, were called for with renewed importunity. The strike was beginning to feel the pressure of the laws of nature.

Now and then, one of my shopmates would drop in, and intimate that it would be dangerous for me to persist in having my own way; but I felt no whit inclined to yield, for, although I had seen the houses of intermarried blacks and whites devastated, and a bonfire made in the street with their furniture, I had but little apprehension of personal violence, and the boss protested that he would 'see me righted,' should any mischief befall. So it went on for a few days longer, when a second deputation waited upon me, and, less ceremonious than the first, they rushed noisily, and without notice, up the stairs, and crowded into my bench-room. There were about twenty of them; their spokesman looked clean and respectable, but the others were a dirty, out-at-elbows, tobacco-chewing crew, only to be described by that expressive American epithet, 'loafers'; and they eyed me with very sinister looks, while the leader began an appeal to my *esprit de corps*. It is scarcely necessary to repeat the argument that followed. Having nothing new to offer, I merely said, that I considered myself at full liberty to work for whatever amount of wages to me seemed satisfactory; that I would no more submit to any interference with that liberty, than to any tyranny over my conscience; and that all I claimed at their hands, was to be let alone. Cries of 'Hustle him out!' frequently interrupted me; and perhaps a proof that 'blows hurts' might have followed, but just as I finished, my boss came in, and commanded the party to leave his premises, with an assurance that he would not suffer me to be molested. The leader, who seemed as much ashamed of his followers as Falstaff was of his ragged regiment, immediately beat a retreat, and his troop with him; one or two, as they went out, declaring that they would 'hammer' me whenever they caught me in the street. I, however, went and came as usual, and for some reason—perhaps the boss's declaration in my favour—met with no annoyance.

What was the upshot? As emigrant cabinet-makers arrived, they were at once engaged, and set to work;

and at the end of six weeks, the strike came to an end. The turn-outs not only failed in carrying their point, but found themselves in a worse position than when they began, for numbers of them were no longer 'wanted,' and had to migrate to the country, or accept a lower rate of wages than before, besides the loss of the best part of the busy season. In our own shop, one American and two of the Germans were altogether dismissed, greatly to their mortification; and in this unexpected reverse, they began to perceive how they had been duped. I, on the other hand, having finished the first bookcase, was well advanced in a second; and had, besides, the satisfaction of knowing that the overplus of my six weeks' earnings was safely added to the 'nest-egg,' and of hearing my shopmates applaud my resolution, and wish that they had done likewise. Many were the conversations touching masters and men that grew out of the event, and, if permitted, I may perhaps take an opportunity of making our conclusions public.

One day, some two years after the strike, while walking down Washington Street, I met the leader of the second deputation aforementioned. 'I guess I have seen you before,' he said, laying a hand upon my shoulder. 'Didn't you work at C—'s? Ah! you were the toughest customer we had; but if we had all done as you did, it would have been better for us.'

THE DOCTOR VERSUS THE MEDICINE.

We have not taken any part in the controversy now raging between the Allopathists and Homœopathists; but we think it our duty to point out a signal benefit which appears to have resulted from it. Allopathy means simply 'another suffering,' and Homœopathy 'the same suffering;' from which the ingenious may conclude, that our regular doctors pretend to cure diseases by inducing other diseases, and the new school by inducing symptoms identical with those of the existing disease. But there is another difference between the schools. The one gives the medicine boldly by the grain, the other cautiously by the millionth part of a grain. Both sometimes fail; both sometimes cure. Which is right?

We cannot pretend to answer the question; but in practice we hold with the regular doctors. We do this because we are used to it. We may be said to have been born with their silver spoon in our mouths; and we should be terrified if the ghost of a grain went in instead. We have done our duty from our youth up by pills, boluses, and draughts: we can lay our hand, with a clear conscience, on our stomach, and avouch that fact. We have ever held our doctor in too much reverence to disobey him; and we revere him more and more every day, since we find him grappling closer and closer with the Homœopathists, and meeting them manfully on their own ground. 'We will not,' says he, 'give in to the absurdity of attempting to counteract a disease by a medicine that produces the same disease; but something good may be learned from your infinitesimal system. To that system you owe the fact that you are now at large: if you had given doses like ours of such medicines, you would have been in the hands of the turnkey or the mad-doctor long ago. Your cures have been effected by your giving so little as not to interrupt nature in any appreciable manner. But we will improve upon your placebos. If an infinitesimal dose is good, no dose at all is better—and, except in special cases, that shall henceforward be our system!'

Our readers may think this a jest; but it is actually the point at which, on the part of the Allopathists, the controversy has arrived. A very intelligent and intelligible paper by Dr C. Radcliffe Hall, of Torquay, has

appeared in the *Provincial Medical and Surgical Journal*, in which the subject is treated in a pleasant and profitable way. He is aware of the difficulty there will be in introducing the new system—of the surprised stare with which the patient will regard the doctor 'doing nothing'; and as confidence is an important part of the cure, the rule cannot be made absolute. 'But as often as it can be adopted it should. By degrees, the doctrine will work its way, that medical attendants are required to survey, superintend, and direct disease, to watch lest harm accrue unnoticed, to employ active remedies when required, or not to interfere at all, as seems to their own judgment best. Every case of successful treatment without medicines will assist to indoctrinate the public with this view. By learning how much nature can do without medicines, people will be able to perceive more correctly how much medicines, when they are necessary, can assist nature.'

The following is given as an example of a case of non-interference. 'A child, above the age of infancy, is chilly, looks dull around its eyes, has headache, pain in the back, quick pulse, and no appetite. It is not known that the digestive organs have been overtaxed. The case may prove—anything. A local inflammation not yet made manifest by local pain; the commencement of continued, or remittent, or exanthematous fever; in a word, there is scarcely any ailment of children of which this may not be the commencement. If, on careful examination, no local disease can be made out, we have no correct indication for special treatment. Give nature fair play. Put the child into a warm bed in a warm room, keep it quiet, stop the supplies of food, but not of water, and wait. When reaction takes place, if there be anything serious, it shews itself, and we then know what to attend to. Very frequently, the case is one of mere ephemeral febrile disorder, from exposure to cold; and in two or three days, the child is perfectly well again, without having taken either medicines or globules. But have we done nothing? When the heart was striving to restore the balance of the circulation, by adopting the recumbent posture, we gave it less work to do. The equable warmth of bed was soothing to the nervous system, and solicited the afflux of blood to the surface. By abstinence, we avoided ministering to congestion of the viscera, and introducing food which, as it could not be properly digested, would decompose and irritate the stomach and bowels.' Here the do-nothing doctor actually assisted nature; he took care that she should not be thwarted in her operations, and he stood by watching the case, like an attorney at the examination of a prisoner, who does nothing, but whose presence is essential to his client. If the usual counteracting remedies had been administered, a disease would have been induced, for which a process of convalescence would have had to be gone through. If the globules had been given simultaneously with the hygienic treatment described, Homœopathy instead of nature would have had the credit of the cure.

'In all chronic blood-diseases,' says Dr Hall, 'medicines are useful, but hygienic treatment'—the word is explained by the treatment of the above case—'must rank the first. In all acute blood-diseases, when mild and occurring in a previously healthy constitution, as they must run through a special course, and last for a certain time, cases will frequently do very well without any medicines. More frequently, a little medicine occasionally to meet a temporary requirement is serviceable; but in every case of this kind, however severe, the difficult point of medical judgment is, rather, when to do nothing, than what to do. Hygienic treatment is invariably necessary. Acting on the principle of the accoucheur, that nature is to be carefully watched, but that so long as she proceeds well, she is to be let alone, we shall meet with few cases of illness in which we cannot find opportunities to judiciously dispense with

medicines.' Another difficulty in adopting this system may be found in the doctor's fear, that if he dispenses with medicines, the patient may dispense with him; but we are of Dr Hall's opinion, that this is quite illusory. The only difference it will make will be, that patients will learn to trust more to the judgment of their medical attendant, and less to the efficacy of his medicines.

Hydropathy proceeds on the hygienic treatment, although doubtless in a somewhat rough manner. Air, exercise, rubbing, cold water, simple food—such are its substitutes both for medicines and globules; and we think the regular doctors might with great advantage take a leaf out of its book, as well as out of the book of homeopathy. With this reform, we would suggest—although with some timidity, for doctors are sensitive on the point—that a re-examination, on broad scientific principles, even of common diseases, would do some good. Doctors are too fond of systems of treatment, which are not made to fit the patient, but which the patient is expected to fit. Diseases run their course, and so do remedies; but it might be well to inquire what relation there is between the course of the one, and that of the other. The unvarying treatment of a disease looks odd to a thinking bystander. The same medicines are administered in case after case; the dose follows the symptom with the certainty of fate. The patient dies—the patient recovers. What then? The doctor has done his best—everything has been according to rule!

The following are the rules laid down for practitioners on the new system:—

'1. Never prescribe medicines when hygiene will do as well and can be enforced.

'2. Never permit the patient, or those around him, to expect more from medicines than medicines can perform.

'3. Never prescribe medicines, except avowedly as mere palliatives, when the period is gone by for them to be of ultimate service.

'4. Never conceal the *general* intention of the treatment; that is, whether it be adopted with a view to cure, or only to mitigate the disease, or merely to alleviate a symptom or symptoms.

'5. Never prescribe medicines more powerful than are necessary; or continue a powerful medicine longer, or repeat it oftener, than the disease actually requires.

'6. Never attribute to the medicine-giving part of the management of a successful case more than its due share of credit.'

We have called this a new system, but a new system is nothing without a name; and we therefore beg leave to suggest one, made up, like the others, of a Greek compound. First, we have Allopathy, another suffering; then Homeopathy, the same suffering; then Hydrophathy, water-suffering; and now let us have Anapathy, no suffering at all.

APPLICATION OF THE SIRENE TO COUNT THE RATE AT WHICH THE WINGS OF INSECTS MOVE.

The buzzing and humming noises produced by winged insects are not, as might be supposed, vocal sounds. They result from sonorous undulations imparted to the air by the flapping of their wings. This may be rendered evident by observing, that the noise always ceases when the insect alights on any object. The sirene has been ingeniously applied for the purpose of ascertaining the rate at which the wings of such creatures flap. The instrument being brought into unison with the sound produced by the insect, indicates, as in the case of any other musical sound, the rate of vibration. In this way it has been ascertained that the wings of a gnat flap at the rate of 15,000 times per second. The pitch of the note produced by this insect in the act of flying is, therefore, more than two octaves above the highest note of a seven-octave pianoforte.—*Lardner's Handbook.*

A WELCOME SACRIFICE.

BY THE REV. JAMES GILBORNE LYONS, LL.D.

VAIN is the blood of rare and spotless herds,
Pastured in meads where blue Clitumnus shines;
Vain are sweet gums from lands that Indus girds,
Or diamonds sought in deep Brazilian mines;
Vain are Iberian fruits, and perfumed flowers,
Rich as a Grecian sunset's purest dyes,
If deemed, when worship claims thy holiest hours,
For HIM IN HEAVEN fit gift or sacrifice.

The flocks that roam on thrice ten thousand hills,
Each living thing that moves on shore and sea,
The gems and gold which gleam in caves and rills,
Saba's low shrub, and Lebanon's proud tree,
The fragrant tribes that spring on cliff and field,
That flush the stream, or fringe the smooth lake's brim,
Breathe, burn, and bloom, at His high will revealed,
And own with joy their Light and Lord in Him.

Our gains are Ills, and, laid before the Cross,
These must of our oblations form a part,
But oh! the choicest ores and gems are dross,
If brought without that pearl of price—THE HEART.
The poorest serf who fears a tyrant's nod,
Whose inmost soul hard bondage racks and wrings—
That toil-worn slave may send unseen to God
An offering far beyond the wealth of kings.

Come thou with breast from pride and passion freed,
Hands which no stain of guilt has ever soiled,
Feet swift and strong for every gentle deed,
Faith, hope, and truth, by sordid crowds unspoiled;
Come with a spirit full of generous love
For all beyond, and all below the skies:—
Make ready thou, for Him who reigns above,
The Christian's gift—A LIVING SACRIFICE.

'MY TRAVELLING COMPANION.'

An individual, signing himself 'A Protestant Dissenter,' has written to us, to remonstrate against one of the heroines of the tale in No. 424, with the above title, having been consigned by the author to the seclusion of a convent. As the same correspondent protests against the 'Visit to an English Monastery' in No. 413, as something calculated to introduce the wedge of Popery among our readers—the said article having given much offence to our Catholic readers, and terrified all our Protestant readers, but one, into thanking God for their own faith—perhaps it may be thought unnecessary for us to notice such a communication. But this is only one of the reproaches we receive almost daily, from all sides of the religious question. Our correspondents are not satisfied with the well-known fact, that while retaining our own opinions, we wilfully interfere with the opinions of no other man. Each secretly thinks we ought to side with him, and would have us sacrifice to this duty the usefulness of a journal which circulates freely among all denominations of religion, and inculcates the practical part of Christianity wherever it goes. We are tired of such correspondence—and there is the truth. Let it be understood once for all, that ours is no more a religious than it is a political mission. The supposed party tendency of expressions that occur here and there in our papers is the result of mere chance; it may be detected as often on one side as on another; and in no publication but our own does it rouse the acrimony of partisans. We give information connected with monasteries, churches, and conventicles, with equal impartiality; and if this is found otherwise than useful or amusing, it is the fault of those who convert facts into sentiments.

Printed and Published by W. and R. CHAMBERS, High Street, Edinburgh. Also sold by W. S. ORR, Amen Corner, London; D. N. CHAMBERS, 35 West Nile Street, Glasgow; and J. M'GLASSAN, 50 Upper Sackville Street, Dublin.—Advertisements for Monthly Parts are requested to be sent to MAXWELL & Co., 31 Nicholas Lane, Lombard Street, London, to whom all applications respecting their insertion must be made.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 429. NEW SERIES.

SATURDAY, MARCH 20, 1852.

PRICE 1½d.

THINGS IN EXPECTATION.

THE passing age is acknowledged to be remarkable in various respects. Great advances in matters of practical science; a vast development of individual enterprise, and general prosperity;—at the same time, strange retardations in things of social concern; a singular want of earnestness in carrying out objects of undeniable utility. Much grandeur, but also much meanness of conception; much wealth, but also much poverty. A struggle between greatness and littleness; intelligence and ignorance; light and darkness. Sometimes we feel as if going forward, sometimes as if backward. One day, we seem as if about to start a hundred years in advance; on the next, all is wrong somewhere, and we feel as if hurriedly retreating to the eighteenth century!

Upon the whole, however, we are ourselves inclined to look at the bright side of affairs; and in doing so, we are not without hope of being able to make some proselytes. Let us just see what are the prospects of the next twenty years—a long enough space for a man to look forward to in anything else than a dream. War, it is true, may intervene, or some other terrible catastrophe; but we shall not admit this into our hypothesis, which proceeds on the assumption, that although people may wrangle here and there, and here and there fly at each other's throats, still the bulk of civilised mankind will go on tranquilly enough to present no direct barrier to the advancing tide. Here is a list of a few trifles in expectation.

A line of communication by railway from England to the principal cities in India, interrupted only by narrow sea-channels, and these bridged by steam-boats. It will then be possible to travel from London to Calcutta in a week.

At the same time, there will be railways to other parts of Asia—Ispahan, Bagdad, Damascus, and Jerusalem. From the last-mentioned city, a line will probably proceed through the land of Edom, to Suez and Cairo; thence to Alexandria. This last portion is already in hand. Think of a railway station in the Valley of Jehoshaphat! As the course of the Jordan presents few 'engineering difficulties,' there might be a single line all the way from Nazareth to the Dead Sea, on which a steamer might take passengers to the neighbourhood of Petra. At a point near the shore of that mysterious sheet of water, a late traveller indicates the spot where Lot's wife was transformed into a pillar of salt. How interesting it would be to make this a stopping-place for tourists to view the adjacent scenery—rocky, wild, and scorched, as if fresh from the wondrous work of devastation!

It cannot be doubted that in a period much short of twenty years, railways will have penetrated from Berlin northwards to Russia; and therefore a communication of this kind through the whole of Europe, even to the shores of the Indian Ocean, will be among the ordinary things of the day.

As for communication by electric telegraph, where will it not be? Every town of any importance, from Moscow to Madras, will be connected by the marvellous wires. These wires will cross seas; they will reach from London to New York, and from New York to far-western cities—possibly to California. The sending of messages thousands of miles, in the twinkling of an eye, will be an everyday affair. 'Send Dr So-and-so on by the next train,' will be the order despatched by a family in Calcutta, when requiring medical assistance from London; and accordingly the doctor will set off in his travels per express, from the Thames to the banks of the Ganges. Spanning the globe by thought will then be no longer a figure of speech—it will be a reality. Science will do it all.

Long before twenty years—most likely in two or three—a journey round the world by steam may be achieved with comparative ease and at no great expense. Here is the way we shall go: London to Liverpool by rail; Liverpool to Chagres by steamer; Chagres to Panama by rail; Panama to Hong-Kong, touching at St Francisco; Hong-Kong to Singapore, whence, if you have a fancy, you can diverge to Borneo, Australia, and New Zealand; Singapore to Madras, Bombay, Aden, and Suez—the whole of the run to this point from Panama being done by steamer; Suez to Cairo, and Cairo to Alexandria (rail in preparation); lastly, by steamer from Alexandria to England. It is deeply interesting to watch the progress of intrusion on the Pacific. Already, within these few years, its placid surface has been tracked with steam-navigation; of which almost every day brings us accounts of the extension over that beautiful ocean. Long secluded, by difficulty of access from Europe, it is now in the course of being effectually opened up by the railway across the Isthmus of Panama. And the grandeur of this invasion by steam is beyond the reach of imagination. Thousands of islands, clothed in gorgeous yet delicate vegetation, and enjoying the finest climate, lie scattered like diamonds in a sea on which storms never rage—each in itself an earthly paradise. When these islands can be reached at a moderate outlay of time, money, and trouble, may we not expect to see them visited by the curious, and flourishing as seats of civilised existence? There is reason to believe, that the equable climate of many of them would prove suitable for persons affected with the complaints of northern

regions; and therefore they may become the Sanatoria of Europe. 'Gone to winter-quarters in the Pacific!'—a pleasant notice this of a health-seeking trip twenty years hence.

It may be reasonably conjectured, that this great and varied extension of journeying round the earth, and in all climates, will not be unaided by new discoveries in motive power. At present, we speak of steam; but there is every probability of new agents being brought into operation, less bulky and less costly, before twenty years elapse. Even while we write, men of science are painfully poring over the subject, and giving indications that in chemistry or electricity reside powers which may be advantageously pressed into the service of the traveller. Admitting, however, that steam will be retained as the prevailing agent of locomotion, we have grounds for anticipating improvements in its application, which will materially cheapen its use. As regards safety to life and limb, much will be done by better arrangements. In steam-voyaging, we may expect that means will be adopted to avert, or at least assuage, the terrible calamities of conflagration and shipwreck—better acquaintance with the principles of spontaneous combustion, and with the natural law of storms, being of itself a great step towards this important result.

One of the latest wonders in practical science, is a plan for cooling the air in dwellings in hot climates; by which persons residing in India, and other oppressively warm countries, may live habitually in an atmosphere cooled down to 60 degrees Fahrenheit, or the ordinary heat of a pleasant day in England. The very ingenious yet simple means by which this is to be effected, will form the subject of notice in our next number. Meanwhile, we may observe that the discovery is due to Mr C. Piazza Smyth, astronomer-royal for Scotland; and if perfectly successful in practice, of which there can be no reasonable doubt, it will have a most important effect in extending European influence over the globe.

The extension of the English language over the civilised world is a curiosity of the age. French, German, Italian, and other continental tongues, seem to have attained their limits as vernaculars. Each is spoken in its own country, and by a few fashionables and scholars beyond. But the language which pushes abroad is the English; and it may be said to be rooting out colonised French and Spanish, and becoming almost everywhere, beyond continental Europe, the spoken and written tongue. Long the Spanish enjoyed the supremacy in Central America; but it has followed the fate of the idle, proud, combative, and good-for-nothing people who carried it across the Atlantic, and is disappearing like snow before the sun of a genial spring. The sooner it is extinct the better. Already the English is the vernacular from the shores of the Atlantic to the Pacific, wherever civilised settlements are formed. As large a population now speaks this nervous language in America as in Great Britain; and this is only an indication of its progress. By means of a rapidly-increasing population, the English language will in twenty years be spoken by upwards of fifty million Americans; and if to these we add all within the home and colonial dominion, the number speaking it at that period will not be short of a hundred millions. What an amount of letter-writing and printing will this produce! And, after all, how small that amount in comparison with what will be seen a hundred years hence, when many hundred millions of men are on the earth, English in speech and feeling, whatever may be their local and political distinctions! The gratification which one experiences in contemplating facts of this kind, transcends the power of language. To all appearance, our English tongue is the expression of civil and religious freedom—in fact, of common sense; and its spread over the globe

surely indicates the progress of civilised habits and institutions.

In referring to the qualities which are usually found in connection with the prevalence of English as a vernacular, we are led to anticipate prodigious strides in the popularisation of literature during the next twenty years. What, also, may we not expect to see done for the extension of epistolary correspondence? Inter-course by letter has advanced only one step of its progress, by the system of inland penny-postage. Another step remains to be effected: the system of carrying letters overseas on the same easy terms. That this Ocean Penny-Postage, as it is termed, will be carried out, at least as regards the larger British colonies, within a period much under twenty years, is exceedingly probable. When this grand achievement is accomplished, there will ensue a stream of intercommunication with distant lands, of which we can at present form no proper conception, and which will go far towards binding all parts of the earth in a general bond of brotherhood.

Such are a few of the things which we may be said to be warranted in looking for within a reasonably short period of time. Other things, equally if not more contributive to human melioration, are less distinctly in expectation. The political prospects of the continental nations are for the present under a cloud. With all the glitter of artistic and social refinement that surrounds them, the bulk of them appear to have emerged but little beyond the middle ages; and one really begins to inquire, with a kind of pity, whether they have natural capacities for anything better. The near proximity to England of populations so backward in all ideas of civil polity, and so changeable and impulsive in their character, cannot but be detrimental to our hopes of national advancement among ourselves; so true is it that peace and happiness are not more matter of internal conviction than of external circumstances.

Unfortunately, if there be something to lament in the condition of our neighbours, there is also something to humiliate on turning our attention homeward. In a variety of things which are required to give symmetry and safety to the social fabric, there appears to be an almost systematic and hopeless stoppage.

Nearly the whole of the law and equity administration of England seems to be a contrivance to put justice beyond reach; and whether any substantial remedy will be applied during the present generation may be seriously doubted.

It is universally admitted that, for the sake of the public health, interment in London and other large cities should be legally prohibited; and that various other sanitary arrangements in relation to these populous localities should be enforced. Yet, legislation on this subject seems to be beyond the grasp of statesmen.

The system of poor-laws throughout the United Kingdom is, with the best intentions, a cause of widely-spread demoralisation. These laws, in their operation, are, in fact, a scheme for robbing the industrious to support the idle. But where is the legislator who will attack and remodel this preposterous system?

The prevention of crime is another of our formidable social difficulties. Every one sees how young and petty criminals grow up to be old and great ones. It is admitted that the punishment of crime, after disorderly habits are confirmed, is no sufficient check; and that, if the evil is to be cured, we must go at once to its root. But when or how is this to be done? Again, there is a call for that scarcest of all things—statesmanship.

The bitterness of sectarian contention is another of the things which one feels to be derogatory to an age of general progress. No longer are men permitted to kill each other in vindication of opinion, but how

mournful to witness persecution by innuendo, vituperation, and even falsehood. Individuals and classes are seen bombarding each other in vile, abusive, and certainly most unchristian language, all ostensibly in the name of a religion which has for a fundamental principle, an utter repudiation of strife! Whether any amendment is to be looked for in this department of affairs within the next twenty years is exceedingly uncertain.

In the roll of disheartening circumstances in our social condition, it would be unpardonable to omit the enormities of intemperance, which, though groaned over day after day, remain pretty much what they have been for years; and it is to be feared, that so long as reformers confine themselves to attacking mere symptoms, instead of going to the foundation of the evil—a deficiency of self-respect, growing out of a want of instruction in things proper to be known, and for which the education of the country makes no provision—all will be in vain. How far there will prevail a more enlarged view of this painful subject, is not discoverable from the present temper of parties.

The legislative conservation of ignorance in the humbler classes of the community, to which reference has just been made, is surely a blot on our social economy. It is seemingly easier to girdle the globe with a wire, than to make sure that every child in Her Majesty's dominions shall receive the simplest elements of education. Within the sphere of the mechanic or the chemist, flights beyond the bounds of imagination may be pursued without restraint, and indeed with commendation; but anything in social economics, however philanthropic in design and beneficial in tendency, falls into the category of disputation and obstruction; and, worst of all, education, on which so much depends, is, through the debates of contending 'interests,' kept at a point utterly inadequate for the general enlightenment and wellbeing.

Thus, many matters of moment are either at a stand, or advancing by feeble and hesitating steps, and the distance to be ultimately reached remains vague and undefinable. At the same time, it is well to be assured that improvements, moral and social, are really in progress; and that, on the whole, society is on the move not in a retrograde direction. Even with a stone tied to its leg, the world, as we have said, contrives 'to get on some way or other.'

THE WRECKER.

On a certain part of the coast of Brittany, some years back, a gang of wreckers existed, who were the terror of all sailors. Ever on the look-out for the unfortunate vessels, which were continually dashed upon their inhospitable shores, their delight was in the storm and the blast; they revelled in the howling of fierce wind, and the lightning's glare was to them more delightful than the brightest show of fireworks to the dweller in large towns. Then they came out in droves, hung about the cliffs and rocks, hid in caverns and holes, and waited with intense anxiety for the welcome sight of some gallant ship in distress. So dreadful were the passions lit up in these men by the love of lucre, that they even resorted to infamous stratagems to lure vessels on shore. They would light false beacons; and strive in every way to delude the devoted bark to its destruction.

The village of Montreaux was almost wholly inhabited by men, who made wrecking their profession. It was a collection of miserable huts, built principally out of the broken materials of the various vessels driven on shore; and ostensibly inhabited by fishermen, who, however, rarely resorted to the deep, except when a long continuance of fine weather rendered their usual avocation less prosperous than usual. They consisted in all of about thirty families, wreckers, for the most

part, from father to son, and even from mother to daughter—for women joined freely in the atrocious trade. Atrocious indeed! for murder necessarily accompanied pillage, and it rarely happened that many of the crew and passengers of the unfortunate vessels escaped alive. Bodies were indeed found along the shore; but even if they exhibited the marks of blows, the sea and the rocks got the credit of the deed.

The interior of the huts of the hamlet presented a motley appearance. Their denizens were usually clothed in all kinds of costume—from the peculiar garments of Englishmen, to the turbans, shawls, and petticoats of Laacars, Malays, and others. Cases of spirits, chests of tools, barrels of flour, piles of hams, cheeses, curious arms, spy-glasses, compasses, &c. were thrust into coffers and corners; while all the villagers were in the habit of spending money that certainly was not coined in France. The state of the good people of Montreaux was one of splendid misery; for, with all their ill-gotten wealth, their improvidence and carelessness was such, that they often wanted necessities—so true is it that ill-gotten money is never well-spent money. A month of fine weather would almost reduce them to starvation, forcing them to sell to disadvantage whatever they still possessed.

This was not, however, the case with every one of them. A man dwelt among them, and had done so for many years, who seemed a little wiser and more careful than the rest of the community. His name was Pierre Sandeau. He was not a native of the place; but had long been established among them, and had at once shewn himself a worthy brother. He was pitiless, selfish, and cold. Less fiery than his fellows, he had an amount of caution, which made them feel his value; and a ready wit, which often helped them out of difficulties. His influence was soon felt, and he became a kind of chief. He was at last recognised as the head of the village, and the leader in all marauding expeditions. But the great source of his power was his foresight. He had always either money or provisions at hand, and was always ready to help one of his companions—for a consideration. In times of distress, he bought up all the stock on hand, and even sold on credit. In course of time, he had become rich, had a better house than the rest, and could, if he liked, have retired from business. But he seemed chained to his trade, and never gave any sign of abandoning his disgraceful occupation.

One day, however, he left Montreaux, and stayed away nearly a fortnight. When he came back, he was not alone: he was accompanied by a young and lovely girl—one of those energetic but sweet creatures, whose influence would be supreme with a good man. Madeleine Sandeau was eighteen—tall, well-proportioned, and exceedingly handsome; she was, moreover, educated. Her father had taken her from school, to bring her to his house, which, though so different from what she was used to, she presided over at once with ease and nature. Great was the horror of the young girl when she found out the character of the people around her. She remonstrated freely with her father as to the dreadful nature of his life; but the old man was cold and inexorable. 'He had brought her there to preside over his solitary house,' he said, 'and not to lecture him!' and Madeleine was forced to be silent.

She saw at once the utter futility of any attempt to civilise or humanise the degraded beings she associated with; and so she took to the children. With great difficulty, she formed a school, and made it her daily labour to instil not only words, but ideas and principles, into the minds of the young, unfledged wreckers. She gained the goodwill of the elders, by nursing both young and old during their hours of sickness, as well as by a slight knowledge of medicine, which she had picked up in a way she never explained, but which always made her silent and sad when she thought of it.

When a black and gloomy night came round, and the whole village was on foot, then Madeleine locked herself in her room, knelt down, and remained in prayer. Now and then she would creep to the window, look out, and interrogate the gloom. She never came forth to greet her father on his return from these expeditions. Her heart revolted even against seeing her parent under such circumstances, and towards morning she went to bed—rarely, however, to sleep.

On one occasion, after a cold and bitter day, the evening came on suddenly. Black clouds covered the horizon as with a funeral pall; the wind began to howl round the hamlet with fearful violence; and Madeleine shuddered, for she knew what was to be expected that night. Scarcely had the gale commenced, when Pierre rose, put on a thick pea-jacket and a sou'-wester, armed himself, and swallowing a glass of brandy, went out. He was the last to leave the village; all the rest had preceded him. He found them encamped in a narrow gorge, round a huge fire, carefully concealed behind some rocks. It was a cold, windy, wet night; but the wreckers cared not, for the wind blew dead on shore, and gave rich promise of reward for whatever they might endure.

A man lay on the look-out at the mouth of the gorge under a tarpaulin. He had a night-glass in his hand, with which he swept the dark horizon, for some time in vain. But the wind was too good to fail them, and the wreckers had patience.

It was really a terrible night. It was pitchy dark: not a star, nor one glimpse of the pale moon could be distinguished. The wind howled among the rocks, and cast the spray up with violence against the cliffs, which, however, in front of the gorge, gave way to a low sandy beach, forming the usual scene of the wreckers' operations. A current rushed into this narrow bight, and brought on shore numerous spars, boxes, and boats—all things welcome to these lawless men.

'A prize!' cried the look-out suddenly. 'A tall Indianman is not more than a mile off shore. She is making desperate efforts to clear the point, but she won't do it. She is ours, lads!'

'Give me the glass!' exclaimed Pierre rising. The other gave him the telescope. 'Faith, a splendid brig!' said the patriarch with a sinister smile—'the finest windfall we have had for many a season. Jean, you must out with the cow, or perhaps it may escape us.'

The cow was an abominable invention which Pierre had taught his comrades. A cow was tied to a stake, and a huge ship's lantern fastened to its horns. This the animal tossed about in the hope of disengaging himself, and in so doing presented the appearance of a ship riding at anchor—all that could be seen on such nights being the moving light. By this means had many a ship been lured to destruction, in the vain hope of finding a safe anchoring-ground. The cow, which was always ready, was brought out, and the trick resorted to, after which the wreckers waited patiently for the result.

The Indianman was evidently coming on shore, and all the efforts of her gallant crew seemed powerless to save her. Her almost naked masts, and her dark hull, with a couple of lanterns, could now plainly be distinguished as she rose and fell on the waters. Suddenly she seemed to become motionless, though quivering in every fibre, and then a huge wave washed clean over her decks.

'She has struck on the Mistral Rock,' said Pierre. 'Good! she will be in pieces in an hour, and every atom will come on shore!'

'They are putting out the boats,' observed Jean.

The wreckers clutched their weapons. If the crew landed in safety, their hopes were gone. But no crew had for many years landed in safety on that part of the coast: by some mysterious fatality, they had always perished.

Presently, three boats were observed pulling for the shore, and coming towards the sandy beach at the mouth of the gorge. They were evidently crammed full of people, and pulling all for one point. The boats approached: they were within fifty yards of the shore, and pulling still abreast. They had entered the narrow gut of water leading to the gorge, and were already out of reach of the huge waves, which a minute before threatened to submerge them. The wreckers extinguished the lantern on the cow's horn. There was no chance of the boats being able to put back to sea.

Suddenly a figure pushed through the crowd, and approached the fire near which Pierre Sandeau stood. It appeared to be one of the wreckers; but the voice, that almost whispered in the old man's ear, made him start.

'Father!' said Madeleine, in a low solemn voice, 'what are you about to do?'

'Fool! what want you here?' replied Pierre, amazed and angry at the same time.

'I come to prevent murder! Father, think what you are about to do? Here are fifty fellow-creatures coming in search of life and shelter, and you will give them death!'

'This is no place for you, Madeleine!' cried the other in a husky voice. 'Go home, girl, and let me never see you out again at night!'

'Away, Madeleine!—away!' said the crowd angrily.

'I will not away!—I will stay here to see you do your foul deed—to fix it on my mind; that day and night I may shout in your ears that ye are murderers! Father,' added she solemnly, 'imbrue your hands in the blood of one man to-night, and I am no child of yours. I will beg, I will crawl through the world on my hands, but never more will I eat the bread of crime!'

'Take her away, Pierre,' said one more ruffianly than the rest, 'or you may repent it.'

'Go, girl, go,' whispered Pierre faintly, while the wreckers moved in a body to the shore, where the boats were about to strike.

'Never!' shrieked Madeleine, clinging frantically to her father's clothes.

'Let me go!' cried Pierre, dragging her with him.

At that moment a terrible event interrupted their struggle. A man stood upright in the foremost boat, guiding their progress. Just as they were within two yards of the shore, this man saw the wreckers coming down in a body.

'As I expected!' he cried in a loud ringing voice. 'Fire!—shoot every one of the villains!'

A volley of small arms, within pistol-shot of the body of wreckers, was the unexpected greeting which these men received. A loud and terrible yell showed the way in which the discharge had told. One-half of the pillagers fell on the stony beach, the other half fled.

Among those who remained was Madeleine. She was kneeling by her father, who had received several shots, and lay on the ground in agony.

'You were right, girl,' he groaned; 'I see it now, when it is too late, and I feel I have deserved it.'

'Better,' sobbed Madeleine, 'better be here, than have imbrued your hands in the blood of one of those miraculously-delivered sailors.'

'Say you so, woman?' said a loud voice near her. 'Then you are not one of the gang. I knew them of old, as well as their infernal cut-throat gorge, and pulled straight for it, but quite prepared to give them a warm reception.'

Madeleine looked up. She saw around her more than fifty men, three women, and some children. She shuddered again at the thought of the awful massacre which would have occurred but for the sailor's prudence.

'My good girl,' continued the man, 'we are cold, wet, and hungry; can you shew us to some shelter?'

'Yes; but do you bid some of your men carry my father, who, I fear, is dying.'

'It is no more than he merits,' replied the man; 'but for your sake I will have him taken care of.'

'It is what I merit,' said Pierre, in a strange and loud tone; 'but not from your hands, Jacques.'

'Merciful God!' cried the sailor, 'whose voice is that?'

'You will soon know; but do as your sister bids you, and then we can talk more at ease.'

Madeleine cast herself sobbing into her brother's arms, who, gently disengaging her, had a litter prepared for his father, and then, guided by Madeleine, the procession advanced on its way. An armed party marched at the head, and in a quarter of an hour the village of Montreaux was reached. It was entirely deserted. There were fires in the houses, and lamps lit, and even suppers prepared, but not a living thing. Even the children and old women on hearing the discharge of musketry, had fled to a cave where they sometimes took shelter when the coast-guard was sent in search of them.

The delighted sailors and passengers spread themselves through the village, took possession of the houses, ate the suppers, and slept in the beds, taking care, however, to place four sentries in well-concealed positions, for fear of a surprise. Madeleine, her father, her brother, the ship's surgeon, and a young lady passenger, came to the house of old Sandeau, who was put to bed, and his wounds dressed. He said nothing, but went to sleep, or feigned to do so.

Supper was then put upon the table, and the four persons above mentioned sat down, for a few minutes in silence. Jacques, the captain of the East-Indiaman, looked moody and thoughtful. He said not a word. Suddenly, however, he was roused by hearing the young surgeon of the *Jeune Sophie* speak.

'Madeleine,' said he, in a gentle but still much agitated tone of voice, 'how is it I find you here—you whom I left at St Omer?'

'Is this, then, the Madeleine you so often speak of?' cried the astonished sailor.

'It is. But speak, my dear friend.'

'Edouard, I am here because yonder is my father, and it is my duty to be where he is.'

'But why is your father here?' continued the other.

'I am here,' said the old man, fiercely turning round, 'because I am at war with the world. For a trifling error, I was dismissed the command of this very *Jeune Sophie* twelve years ago. I vowed revenge, and you see the kind of revenge I have selected.'

'Dear father,' said Madeleine gently, 'see what an escape you have had!'

'Besides,' interposed Jacques, 'there was no occasion for revenge. M. Ponceau, who had adopted me, searched for you far and wide, to give you another ship. They dismissed you in a moment of anger. They proved this, by giving me the command of the *Jeune Sophie* as soon as I could be trusted with it.'

'What is done is done,' said Pierre, 'and I am a wrecker! I have done wrong, but I am punished. Jacques, my boy, take away Madeleine; I see this life is not fit for her. If I recover, I shall remain, and become the trader of the village.'

'No, father, you must come with us,' observed Jacques sadly. 'You and I and Madeleine will find some quiet spot, where none will know of the past, and where we ourselves may learn to forget. I have already saved enough to support us.'

'And your wife, sir?' said the young lady, who had not hitherto spoken.

'Leonie, you can never marry me now. You are no fit mate for the son of a wrecker.'

'Jacques,' interposed the young surgeon, 'neither you nor Madeleine has any right to suffer for the errors of your father. I made the acquaintance of your

sister at my aunt's school in St Omer. I loved her; and before I started on this journey, I had from her a half-promise, which I now call upon her to fulfil.'

'What say you, Madeleine?' said Jacques gravely.

'That I can never give my hand to a man whom I love too well to dishonour.'

'Madeleine, you are right, and you are a noble girl!' replied her brother.

'Children,' said the old man, with a groan, 'I see my crime now in its full hideousness; but I can at least repair part of the evil done. Now, listen to me. Let me see you follow the bent of your hearts, and be happy, and I will go where you will, for you will have forgiven your father. Refuse to do so, and I remain here—once a wrecker, always a wrecker. Come, decide!'

Madeleine held out her hand to Edouard, and Jacques to Leonie, his friend's sister, returning from the colony where her parents had died. The old man shut his eyes, and remained silent the rest of the evening.

Next day, conveyances were obtained from a neighbouring town, and the crew and passengers departed. The reunited friends remained at Montreaux, awaiting the recovery of Pierre, Jacques excepted, he being forced to go to Havre, to explain events to his owners. In ten days he returned. Old Sandeau was now able to be removed; and the whole party left Montreaux, which was then stripped by its owners, and deserted.

The family went to Havre. The father's savings as a captain had been considerable. United with those of Jacques, they proved sufficient to take a house, furnish it, and start both young couples in life. Edouard set up as a surgeon in Havre, his brother-in-law was admitted as junior partner into the house of Ponceau, and from that day all prospered with them. Old Sandeau did not live long. He was crushed under the weight of his terrible past; and his deathbed was full of horror and remorse.*

LOWELL MECHANICS' FAIR.

THERE are very few places in the world that bear the mark of progress so strongly as this town, destined, beyond all doubt, to be the Manchester of the United States, and to enter—indeed it is now entering—into active rivalry with the Old Country in her staple manufactures, cottons and woollens. In the year 1821, few visited the small, quiet village, of about 200 inhabitants, situated in a mountain-nook at a bend of the Merrimac, at a point where that stream fell in a natural cascade, tumbling and gushing over its rocky, shallow bed, quite unconscious of the part it was to play in the world's affairs. This village was twenty-five miles north-west of Boston, not on a high-road leading anywhere; but, nevertheless, it began to move on, as usual, by the erection of a saw-mill, as at that point it was found convenient to arrest the downward progress of the timber, and convert it into plank. And so it went on, and on, step by step, till it became the splendid town it is, so large as to have two railway depôts: one in the suburbs, and the principal one in the centre of the town—for the Yankees think the closer their railways are to the town the better.

Lowell now covers five square miles, with handsome, straight streets; the principal one, Merrimac Street, being a mile and a half in length, and about sixty feet wide, with footways twelve feet wide, and rows of trees between them and the road. The appearance of this street reminds the spectator of the best in France. The loom-power of a manufacturing place, I understand, is estimated by the number of spindles, and this works 850,000; the mills employ 14,000 males, and

* This legend is still told by the peasants of Brittany, who point out the site of Montreaux.

10,000 females; the number of inhabitants reckoned stationary, 12,000. It has lately been raised to the dignity of a city by a charter of incorporation, which, in the state of Massachusetts, can be claimed by any town when the number of its inhabitants amounts to 10,000: thus it appoints its officers, and manages its own affairs, as a body corporate and municipal.

The most striking feature of the social system here, is the condition of the mill-workers, of which, as it is so different from ours, I shall give you some particulars. The corporation of Lowell has built streets of convenient houses, for the accommodation of the workmen; and nine-tenths of these are occupied by the unmarried. These houses are farmed by the corporation to elderly females, whose characters must bear the strictest investigation, and at a rent just paying a low rate of interest for the outlay. They carry on the business under strict rules, which limit the numbers, and determine the accommodation of the inmates, two of whom sleep in one room. Females, whose wages are 12s. per week, pay 6s. 6d. per week for board and lodging; for males, the wages and cost of board are about 15 per cent. higher. These females are housed, fed, and dressed as well as the wives and daughters of any tradesman in Edinburgh or London. The hours of work at the mills leave them leisure; which some spend in fancy needle-work, so as to increase their income; and all, by arrangements among themselves, have access to good libraries. The amusements are balls, reading-rooms, lectures, and concerts; indeed, all the means of intellectual cultivation are placed within their reach, and full advantage is taken of them. There is an ambition to save money, which they nearly all do; those in superior situations, such as overlookers, have considerable sums in the savings-banks established by the companies owning the mills; the workers in each mill thus putting their weekly savings into the concern, from which they receive interest in money, and so having an interest in the well-doing of the mill itself, and a bond of attachment to its proprietors. In this manner, the capital of all is constantly at work, and provision is made for a possible slackness, which, however, has not yet befallen Lowell.

To this place, it is no longer a toilsome journey from Boston. Three-quarters of an hour, in a very commodious railway-carriage, brought me into the centre of the town, when a most interesting sight presented itself. The railway had been pouring in for the occasion upwards of 20,000 persons; and in the streets, all was bustle and harmony; thousands of well-dressed persons—some of the females elegantly so—moving in throngs here and there, all bearing the tokens of comfort and respectability. The occasion of the gathering is called the Mechanics' Fair, held for a fortnight, during some days of which all mill-work is suspended; the attraction consisting of a horticultural and cattle show, and an exhibition of the products of art and manufactures of the county, which is Middlesex.

The horticultural show was in the Town-hall, a large, handsome apartment, with long aisles of tables, covered with piles of fruits and vegetables; and such fruits! peaches, nectarines, apricots, and the choicest plums, all of open-air growth, and not surpassed by any I have seen—fully equal to the best hot-house productions of England. Vegetables also very fine, all equal to the finest, except the turnip, which in New England is small. The flowers as beautiful as in the Old Country, but much smaller; consequently, that part of the show was much inferior to our shows of the kind. In the evening of each day, the fruits are put up to auction, and a good deal of merriment is caused by this part of the entertainment. Those who supply the show are well paid, as each morning there is a fresh supply; thus proving that it is not the selected few that are exhibited, but the average produce of the county.

From thence I walked to the show of products of

industry. I found a building 600 feet in length, 40 feet wide, and two storeys high, crammed with such a variety of articles that it is extremely difficult to describe them, or, indeed, to reduce them to order in the mind. I do not propose to send you a catalogue, but to convey, as far as I can, the impression made upon me. The ground-floor is devoted to the exhibition of agricultural implements and machinery. I have no intention to enter into the question of our own patent laws, but I cannot refuse to acknowledge the superiority of the arrangements here. The greatest advantage is, that the right to an invention is so simply, cheaply, and easily secured, that there is no flinching or ill-feeling. Talking with a very intelligent person, who was kindly trying to give me definite ideas in this labyrinth of cranks and wheels, by shewing and explaining to me the movements of a most singular machine for making carding implements—I said: How is it, that with these wonders, the American portion of the Crystal Palace in London should have been so scant? Here is enough for almost an indefinite supply: the reaping-machine is but a unit.' 'True,' he replied, 'but we could get no guarantee for securing the patents; and if one man was simple enough to give the English his reaping-machine, it did not suit others to be robbed. We have little ambition about the matter: satisfied with what we have, we cannot afford to give away inventions for the sake of fine words.' This explained the whole to me.

The first store I looked over in this country was one in Boston, having an immense stock of agricultural implements, and tools for every mechanical purpose. I should know something of such matters, having whistled at the plough myself, and used most of the implements; and being therefore curious on the point, I looked in for the sake of old associations. I am positive that every article for agricultural and mechanical use is better made than with us, and more adapted to its purpose—tools especially. What has been said of the plough in London, is equally true of all other implements in use in America, from the most complicated to the most simple. The Englishman uses what his fathers used; the American will have the tool best adapted, whether existing before his time or not. In favour of this superiority in tools is the fine quality of the hard-woods used here. At the Fair I saw some coach and chaise wheels, of the most beautiful make, of hickory, which is as durable as metal-spokes, not thicker than the middle finger, but strong enough for any required weight, and with great flexibility; and from its extreme toughness, calculated for the wood-work of implements. The apartment on the ground-floor was entirely occupied by machines in motion, and each was attended by a person who explained, with the greatest civility and intelligence, the uses of the various parts of the machine, setting it going, or stopping it, as necessary: each had its crowd of listeners; and I could not but admire the patience and politeness of the lecturer, as he endeavoured to explain the wondrous capabilities of his own pet machine. It would require a volume to follow the subject thoroughly; but I will mention what appeared to be the newest inventions, or those not known in England.

A crowd of ladies were watching with great attention the Sewing-machine—sewing away with the greatest exactness, and much stronger than by the ordinary mode with a needle, as each stitch is a knot. The inventor was shewing it; and he said he had nearly completed a machine for the button-holes. The next was a machine called 'The Man'—and truly named, for a more marvellous production can scarcely be conceived—for making implements for carding wool or cotton, the article passing in as raw wire, going through before our eyes four processes of the most delicate description, and finally coming out a perfect card, with its wire-teeth exactly set, and ready for use. My attention was drawn to the application of the Jacquard

principle to a loom engaged in weaving a calico fabric, of various colours woven with a pattern, and thus producing an elegant article, thick, and well adapted for bed-furniture. But the most curious and simple, and withal, perhaps, the most important invention for facilitating manufactures, is what is called the 'Turpin Wheel,' taking its name from the inventor. How simple may be the birth of a great idea! We all observe that a log under a waterfall, coming down perpendicularly upon it, spins round, as on an axis, till it escapes. This led to the invention in question. The water falls upon the spokes of a horizontal wheel, which it sends round with great velocity; and by this contrivance the force of the water is more than doubled. I must not omit to mention the machine just invented for weaving the fabric we call Brussels carpeting. This machine will weave twenty yards of carpeting per day, with one female to attend it. The carpet is worth 3s. per yard, while the wages paid for human aid in its production is 1½d. per yard: machinery can go little further. Let me add, that I was informed that everything on this floor was the invention of working-men.

Upon ascending to the first floor, I found the apartment arranged with stands—each stand devoted to one sort of manufacture—and attended, as below, by an intelligent person, to shew and explain. Here was every description of furniture, cotton, and woollen fabric; but neither velvets nor silks, which have not, as yet, been introduced. We know so much of our doings in England in the woollen and cotton line, that my attention was principally attracted to these specimens. Here was everything except the broad-cloths—all the patterns of plaid-shawls, so beautifully imitated and executed, that they would, I am sure, pass in Edinburgh. I saw the kerseymere fabric that obtained the prize in London, and nothing could be more beautiful; for the calicoes, I believe we cannot produce them cheaper or better. A writer in a journal here, observes: 'Why should our cotton go to England to be spun when we can spin it in Massachusetts?' A very pertinent question, well worth thinking of at home. We should be thankful to the projectors of the Crystal Palace, that it has opened our eyes, for nothing else could. There is no manner of doubt, that we can learn something beyond yacht-sailing; but we shall not open our eyes to the widest until the arrival in our market of the first cargo of manufactured woollens and cottons; and as surely as we have barrels of flour and pork, we shall soon find them with us: I saw first-rate calico, which could be sold at 2d. per yard.

The exports of manufactured goods from this country to all parts of the world is increasing weekly; but of all that another time, for I am carefully collecting information. One stand I would not omit, as it furnished evidence of the condition of the operatives. The exhibition is managed by the mechanics themselves, and the profits are devoted to the support of a mechanics' institute, with the usual advantages of library, balls, and concerts, but of a very superior order; while every female who provides any article of her own production for exhibition and sale, has a free ticket admitting to all the advantages of the institution. This is found a useful stimulus, as the stand for those articles testified, consisting as they did of all descriptions of fancy-work: rugs, chair-bottoms, table-covers, tapestry, &c. produced in overhours, tasteful in design, and beautiful in execution. Let me not forget an invention, which is as great a boon to sufferers as the water-bed: it is a contrivance applied to an ordinary bedstead, which, by turning a handle, will support any part of the body, or place the body in any required position. It was the invention of a mechanic, who was nine months in bed in consequence of an accident, and felt the want of something of the kind. It is adapted to a bedstead at a cost of £3.

From thence I went to the cattle-show. I could see but little of that, as most of the animals were gone; but

I was assured it was very fine. I believe it, if what I saw was a specimen—a pair of working oxen, perfectly white, the pair weighing 7000 pounds. In our cattle-shows at home, we find plenty of bulk, but it destroys form and symmetry: here both were preserved. The fowls are of the long-legged Spanish breed, coming to table like trussed ostriches; the plump English barn-door sort are about being introduced. I had nearly forgotten a beautiful and extraordinary invention—a rifle, not heavier than the common one, that will discharge twenty-four balls in succession without reloading. Where the ramrod is usually placed, is a smaller barrel, containing, when filled, twenty-four ball-cartridges, and, after discharging, the action of recocking introduces another cartridge, and so on, until the whole are discharged; the whole twenty-four can be discharged in as many seconds!

After leaving this interesting exhibition, where I could have lingered a whole day, I was joined by a friend, an American—a gentleman of great attainments in science—to whose remarks I am indebted for the following scraps. The Merrimac, when low—as when I saw it—is a trifling stream, having a bottom of laminated rock, worn in channels by the stream. At spring and fall, there is ten or fifteen feet of depth; and to remedy this inequality, an important work was undertaken and executed: to this we bent our way. It is a canal in form, but should more properly be called a reservoir. It is 1½ miles long, 100 feet wide, and 15 feet deep; of solid granite, sides and bottom—equal in durability to any work, ancient or modern. It is about half way cut through the solid granite rock, which in that part furnishes a natural wall. My friend had watched its progress, and gave me many interesting details of the engineering processes employed: among others, the tremendous application of steam and gunpowder. An engine bored holes in the rock fifteen feet deep and twelve inches in diameter; and these were so placed, and in such numbers, that at a single blast 170 tons of granite were blown into the air—an operation hardly conceivable. This canal leaves the town in a westerly direction—being, at its outset, about a quarter of a mile from the Merrimac, but gradually approximating for a quarter of a mile, until it touches and unites with that river. Between the two, is one of the prettiest of public walks, ten feet wide, having rows of trees on each side, and terminating in a point; being the end of a splendid granite wall, at its base thirty feet thick, and tapering to half the thickness, dividing the natural from the artificial stream. Here we come to a point of great interest: on the right is an artificial dam across the river, with two sharp lines at an angle of sixty-seven degrees, the point meeting the stream, thus stopping the waters, and insuring a supply for the reservoir, while it forms a cascade of about twenty feet.

My friend gave me a very graphic description of the opening of the works. The whole was built in a coffer-dam, quite dry, and the opening was a holiday. Every spot within sight was covered with spectators, for whom the engineer had contrived a surprise. The works used in keeping the water out of the reservoir, and protecting the new dam, were undermined, and charged with gunpowder. At a given signal, the train was fired, and in an instant the whole blew up; and when the smoke cleared away, the fragments were floating down the Merrimac, and the canal full of water.

On the left from the point, the egress of water is regulated by flood-gates of a superior construction. The building crosses the canal, and contains seven huge gates, which are raised or dropped into their places by beautiful machinery. To each gate is attached an immense screw, which stands perpendicularly, twenty feet long and ten inches in diameter. At its upper end, it passes through a matrix-worm in the centre of a large cog-wheel, lying horizontally.

The whole is set in motion by the slightest turning of a handle; and here I saw the application of the Turpin Wheel I spoke of before—no engine or complication, but a wheel fifteen feet in diameter, fixed horizontally, submerged in the stream, receiving the falling waters, and thus rapidly revolving, and by a gear, giving motion to the machinery for raising or lowering the immense gates, stopped or set going by merely turning a stop-cock, and requiring no more force than an ordinary water-cistern.

I cannot leave this interesting spot without an attempt to describe the beautiful scene. A little to the right, the river widens into a sort of bay, with several fine islands covered with wood; in front, across the stream, as far as the eye can reach, are the forests of New Hampshire, with occasional headlands of green-sward. In the autumn, it has exactly the appearance of a gigantic flower-garden—the trees being of every imaginable colour. 'Ah!' said my friend, 'this is an interesting spot: it was the favourite residence and hunting-ground of the Chippewas. The Indians, like your monks of old in Europe, always chose the most beautiful and picturesque sites for their dwellings; but they have retired before the advance of a civilisation they could not share or appreciate.' Talking in this way, as we returned, he called my attention to a singular phenomenon in the river. At some remote period there was, and it remains to the present moment, a rock standing in the middle of the stream, about twelve feet in diameter at the top, of an irregular form, and of the hardest granite. By the action of the water, a mass of granite had been thrown on the top, where it lodged. At high-water, perhaps during three months in each year, the stream had caused this mass to revolve on its own axis, until it has worn itself of a round figure, and worn also the rock into a cup, now about six feet deep. Still, it revolves when the water reaches it—nature still plays at this cup-and-ball—the ball weighing five tons. Talk of this sort brought us to the railway. In due time I reached home; and I do not remember to have ever been more interested than by the day spent at Lowell.

THE SEA AND THE POETS.

Of three poets, each the most original in his language, and each peculiarly susceptible of impressions from external nature—Horace, Shakspeare, and Burns—not one seems to have appreciated the beauty, the majestic sublimity, the placid loveliness, alternating with the terrific grandeur, of the 'many-sounding sea.' Judging from their incidental allusions to it, and the use they make of it in metaphor and imagery, it would seem to have presented itself to their imaginations only as a fierce, unruly, untamable, and unsightly monster, to be loathed and avoided—a blot on the fair face of creation—a necessary evil, perhaps; but still an evil, and most certainly suggestive of no ideas poetic in their character.

It is marvellous, for there is not one of these poets who does not discover a lively sense of the varied charms of universal nature, and has not painted them in glowing colours with the pencil of a master. Who has not noted with what evident love, with what a nicely-discriminative knowledge Shakspeare has pictured our English flowers, our woodland glades, the forest scenery of Old England, before the desolating axe had prostrated the pride of English woods? How vividly has not Burns translated into vigorous verse each feature of his native landscape, till

— 'Auld Coila's plains and fells,
Her muirs, red-brown wi' heather-bells,
Her banks and braes, her dens and dells,'

live again in the magic of his song. And Horace—with

what charming playfulness, with what exquisite grace, has he not figured the olive-groves of Tibur, the pendent vines ruddy with the luscious grape, the silver streams, the sparkling fountains and purple skies of fruitful Campania! Looking on nature with a poet's eye, as did these poets, one and all of them, is it not a psychological mystery that none of them should have detected the ineffable beauty of a sea-prospect?

First, as to Horace. When climbing the heights of Mount Vultur, that Lucanian hill where once, when overcome by fatigue, the youthful poet lay sleeping, and doves covered his childish and wearied limbs with leaves—Horace must have often viewed, with their wide expanse glittering in the sun, the waters of the Adriatic—often must he have hailed the grateful freshness of the sea-breeze and the invigorating perfumes of

— 'the early sea-smell blown
Through vineyards from some inland bay.'

Yet about this sea, which should have kindled his imagination and inspired his genius, this thankless bard poetises in a vein such as a London citizen, some half-century back, might have indulged in after a long, tedious, 'squally' voyage in an overladen Margate hoy.

No such spirit possessed him as that which dictated poor Campbell's noble apostrophe to the glorious 'world of waters:—

— 'Earth has not a plain
So boundless or so beautiful as thine;
The eagle's vision cannot take it in;
The lightning's glance, too weak to sweep its space,
Sinks half-way o'er it, like a wearied bird:
It is the mirror of the stars, where all
Their hosts within the concave firmament,
Gay marching to the music of the spheres,
Can see themselves at once.'

Horace, indeed, has sung the praises of Tarentum—that beautiful maritime city of the Calabrian Gulf, whose attractions were such as to make the *delights of Tarentum* a common proverbial expression. But what were these delights as celebrated by our poet?—the perfection of its honey, the excellence of its olives, the abundance of its grapes, its lengthened spring and temperate winter. For these, its merits, did Horace prefer, as he tells us, Tarentum to every other spot on the wide earth—his beloved Tibur only and ever excepted. In truth, Horace valued and visited the sea-side only in winter, and then simply because its climate was milder than that to be met with inland, and therefore more agreeable to the dilapidated constitution of a sensitive valetudinarian. His commentators suppose he produced nothing during his marine hybernations: if the inclement season froze 'the genial current of his soul,' the aspect of the sea did not thaw it.

His motive for his sea-side trips is amusingly set forth in one of the most lively and characteristic of his Epistles—the fifteenth of the first book. In this he inquires of a friend what sort of winter weather is to be found at Velia and Salernum; two cities, one on the Adriatic, the other on the Mediterranean seaboard of Italy—what manner of roads they had—whether the people there drank tank-water or spring-water—and whether hares, boars, crabs, and fish were with them abundant. He adds, he is not apprehensive about their wines—knowing these, as we may infer, to be good—although usually, when from home, he is scrupulous about his liquors; whilst, when at home, he can put up almost with anything in the way

of potations. It is quite plain Horace went down to the sea just in the spirit in which a turtle-fed alderman would transfer himself to Cheltenham; or in which a fine lady, whose nerves the crush, hurry, and late hours of a London season had somewhat disturbed, would exchange the dissipations of Mayfair for the breezy hills of Malvern, or the nauseous waters of Tunbridge Wells.

This certainly explains, and perhaps excuses, the grossly uncivil terms in which alone he notices the sea. One of the worst of Ulysses' troubles was, according to him, the numerous and lengthy sea-voyages which that Ithacan gadabout had to take. Horace wishes for Mævius, who was his aversion, no worse luck than a rough passage and shipwreck at the end of it. His notion of a happy man—*ille beatus*—is one who has not to dread the sea. Augustus, whose success had blessed not only his own country, but the whole world, had—not the least of his blessings—given to the seamen a calmed sea—*pacatum mare*. Lamenting at Virgil's departure for Athens, he rebukes the impiety of the first mariner who ventured, in the audacity of his heart, to go afloat and cross the briny barrier interposed between nations. He esteems a merchant favoured specially by the gods, should he twice or thrice a year return in safety from an Atlantic cruise. He tells us he himself had known the terrors of 'the dark gulf of the Adriatic,' and had experienced 'the treachery of the western gale,' and expresses a charitable wish, that the enemies of the Roman state were exposed to the delights of both. He likens human misery to a sea 'roughened by gloomy winds,' 'to embark once more on the mighty sea,' is his figurative expression for once more engaging in the toils and troubles of the world; Rome, agitated by the dangers of civil conflict, resembles an ill-formed vessel labouring tempest-tossed in the waves; his implacable Myrtale resembles the angry Adriatic, in which also he finds a likeness to an ill-tempered lover. All through, from first to last, the gentle Horace pelts with most ungentle phrases one of the noblest objects in nature, provocative alike of our admiration and our awe, our terror and our love.

And even Shakspeare must be ranged in the same category. The most English of poets has not one laudatory phrase for

— 'The seas
Which God hath given for fence impregnable'

to the poet's England. It is idle to say that Shakspeare was inland-bred—that he knew nothing, and could therefore have cared nothing about the matter—seeing that, insensible as he might have been to its beauties, he makes constant reference to the sea, and even in language implying that his familiarity with it was not inferior to that of any yachtsman who has ever sailed out of Cowes Harbour. He uses nautical terms frequently and appropriately. Romeo's rope-ladder is 'the high top-gallant of his joy'; King John, dying of poison, declares 'the tackle of his heart is cracked,' and 'all the shrouds wherewith his life should sail' wasted 'to a thread.' Polonius tells Laertes, 'the wind sits in the shoulder of your sail'—a technical expression, the singular propriety of which a naval critic has recently established; whilst some of the commentators on the passage in *King Lear*, descriptive of the prospect from Dover Cliffs, affirm that the comparison as to apparent size, of the ship to her cock-boat, and the cock-boat to a buoy, discover a perfect knowledge of the relative proportions of the objects named. In *Hamlet*, *Othello*, *The Tempest*, *The Merchant of Venice*, *The Comedy of Errors*, *Twelfth Night*, *Winter's Tale*, *Measure for Measure*, and *Pericles*, sea-storms are made accessory to the development of the plot, and sometimes described with a force and truthfulness which forbid the belief that the writer had never

witnessed such scenes: however, like Horace, it is in the darkest colours that Shakspeare uniformly paints 'the multitudinous seas.'

In the *Winter's Tale*, we read of—

— 'the fearful usage
(Albeit ungentle) of the dreadful Neptune.'

In *Henry V.*, of 'the furrowed sea,' 'the lofty surge,' 'the inconstant billows dancing'; in *Henry VI.*, Queen Margaret finds in the roughness of the English waters a presage of her approaching wo; in *Richard III.*, Clarence's dream figures to us all the horrors of 'the vasty deep'; in *Henry VIII.*, Wolsey indeed speaks of 'a sea of glory,' but also of his shipwreck thereon; in *The Tempest* we read of 'the never surfeited sea,' and of the 'sea-marge sterile and rocky-hard,' in the *Mid-summer's Night Dream*, 'the sea' is 'rude,' and from it the winds 'suck up contagious fogs'; *Hamlet* is as 'mad as the sea and wind,' the violence of Laertes and the insurgent Danes is paralleled to an irruption of the sea, 'overpeering of his list'; in the well-known soliloquy is the expression, 'a sea of troubles,' which, in spite of Pope's suggested and tasteless emendation, commentators have shewn to have been used proverbially by the Greeks, and more than once by Æschylus and Menander. Still, Shakspeare, again like Horace, was not insensible to the merits of sea-air in a sanitary point of view. Dionyza, meditating Marina's murder, bids her take what the Brighton doctor's call 'a constitutional' by the sea-side, adding that—

— 'the air is quick there,
Piercing and sharpens well the stomach.'

As to Burns, his most fervent admirer can scarcely complain when we involve him in the censure to which we have already subjected Horace and Shakspeare. He, too, writes about the sea in such a fashion, that we should hardly have suspected, what is true, that he was born almost within hearing of its waves; that much of his life was passed on its shores or near them, and that at a time of life when external objects most vividly impress themselves on the senses, and exercise the largest influence on the taste.

The genius of 'Old Coila,' in sketching the poet's early life, says—

'I saw thee seek the sounding shore,
Delighted with the dashing roar;'

but few tokens of this 'delight' are to be observed in his poetry. He has, indeed, his allusions to 'tumbling billows' and 'surging foam'; to southern climes where 'wild-meeting oceans boil'; to 'life's rough ocean' and 'life's stormy main'; to 'hard-blowing gales'; to the 'raging sea,' 'raging billows,' 'boundless oceans roaring wide,' and the like; but these are the stock-metaphors of every poet, and would be familiar to him even had he never overpassed the frontiers of Bohemia.

One sea-picture, and one alone, is to be found in Burns, and this, it is freely admitted, is exquisite:

'Behold the hour, the boat arrive;
Thou goest, thou darling of my heart!
Severed from thee, can I survive?
But fate has willed, and we must part.
I'll often greet this surging swell,
Yon distant isle will often hail:
E'en here I took the last farewell;
There latest marked her vanished sail.'

Along the solitary shore,
While flitting sea-fowl round me cry,
Across the rolling, dashing roar,
I'll westward turn my wistful eye:
Happy thou Indian grove, I'll say,
Where now my Nancy's path may be!
While through thy sweets she loves to stray,
Oh! tell me, does she muse on me?'

This charming lyric, the pathetic tenderness of which commends it to every feeling heart, is all that Burns has left in evidence that the sea had to him, at least, one poetic aspect.

CURIOSITIES OF CHESS.

MORE has perhaps been written about chess-playing than any other of the games which human ingenuity has invented for recreative purposes, and it is not easy to foresee the time when dissertation or discovery on the subject shall be brought to a satisfactory conclusion. Scarcely a year passes that does not add something to our knowledge of the history of the royal game; and among the latest additions, the able paper by Mr Bland, published in the *Journal of the Royal Asiatic Society*, is not the least deserving of notice. It contains many curious particulars and remarks, interspersed in its dry and technical narrative, sufficient to form a page or two of pleasant reading for those—and they are not few—to whom chess is interesting.

We must premise that Mr Bland takes three but little-known Oriental manuscripts as the groundwork of his observations; one of them, in the Persian character, is said to be 'probably unique,' though, unfortunately, very imperfect. It bears no date or author's name, these being lost with the missing portions, but the treatise itself contains internal evidence of very high antiquity. The author, whoever he was, tells us that he had travelled much through Persia and the adjacent countries, from the age of fifteen until the middle period of life, during which he gained the knowledge and experience which enabled him to write his book. Besides which, he measured his strength with many masters of the art of chess-playing, adding on each occasion to his reputation as a conqueror: 'and whereas,' as he relates, 'the greater number of professors were deficient in the art of playing without looking at the board, I myself played so against four adversaries at once, and at the same time against another opponent in the usual manner, and, by divine favour, won all the games.' Here, singularly enough, we find a Persian Staunton making himself famous perhaps long before Norman William thought of invading Britain—so true it is, that in mere intellectual achievements we have scarcely surpassed bygone generations. He, the Persian, evidently entertained a comfortable idea of his own abilities; for he boasts largely of the improvements and new moves or positions which he has introduced into the game. He disputes, too, the authenticity of the belief, that chess was originally invented in India, and that it was first introduced into Persia in the sixth century of our era by a physician, whom Nushirwan had sent to seek for the work known as Pilpay's Fables. On the contrary, he contends that chess, in its original and most developed form, is purely a Persian invention, and that the modern game is but an abridgment of the ancient one. In how far this statement is borne out by the fact, we have at present no means of knowing; and until some more complete manuscript or other work shall be brought to light which may supply the want, we must rest content with the account familiar to most readers—that chess was invented by an Indian physician for the diversion of the monarch, his master, and the reward claimed in grains of corn, beginning with one grain on the first square of the board, and doubling the number in regularly increasing progression up to the last.

We may here briefly state what the ancient, or, as it is commonly called in the East, 'Timour's Game,' was. It required a board with 110 squares and 56 men—almost as many again as are used in modern chess—and the moves were extremely complicated and difficult to learn. The rectangularity of the board was interrupted by four lateral squares, which served as a fort, or

special point of defence for the king, whose powers, as well as those of the other pieces, were in many respects different from those at present known. 'Timour's mind,' we are told, 'was too exalted to play at the Little Chess, and therefore he played only at the Great Chess, on a board of ten squares by eleven, with the addition of two camels, two zarafahs, and other pieces, with Persian designations.'

Next we come to a complete chapter, entitled the 'Ten Advantages of Chess,' in which the views and reasonings are eminently Oriental and characteristic. The first explains that food and exercise are good for the mind as well as for the body, and that chess is a most excellent means for quickening the intellect, and enabling it to gain knowledge. 'For the glory of man is knowledge, and chess is the nourishment of the mind, the solace of the spirit, the polisher of intelligence, the bright sun of understanding, and has been preferred by the philosopher, its inventor, to all other means by which we arrive at wisdom.' The second advantage is in the promotion and cultivation of religion; predestination and free-will are both exemplified—the player being able to move where he will, yet always in obedience to certain laws. 'Whereas,' says the writer, 'Nerd—that is, Eastern backgammon—on the contrary, is mere free-will, while in dice, again, all is compulsion.' The third and fourth advantages relate to government and war; and the fifth to astronomy, illustrating its several phenomena as shewn by the text, according to which 'the board represents the heavens, in which the squares are the celestial houses, and the pieces, stars. The superior pieces are likened to the moving stars; and the pawns, which have only one movement, to the fixed stars. The king is as the sun, and the wazir in place of the moon, and the elephants and taliah in the place of Saturn, and the rukhs and dabbabah in that of Mars, and the horses and camel in that of Jupiter, and the ferzin and zarafah in that of Venus; and all these pieces have their accidents, corresponding with the trines and quadrates, and conjunction and opposition, and ascendancy and decline—such as the heavenly bodies have; and the eclipse of the sun is figured by shah caim or stale mate;' and much more to the same purport. We question whether the astronomer-royal ever suspected he was illustrating his own science when engaged in one of his quiet games of chess with the master of trinity.

The sixth advantage is somewhat astrological in character: as there are four principal movements of chess, these answer to the four physical temperaments, Cold, Warm, Dry, and Wet, which are ruled by their respective planets; and thus each piece on the board is made to have its peculiar significance in relation with the stars. It is further shewn, that chess-playing is remedial against many of the lesser bodily ailments; 'and no illness is more grievous than hunger and thirst, yet both of these, when the mind is engaged in chess, are no longer thought of.' Next in order, the seventh advantage, is 'in obtaining repose for the soul;' as the author observes: 'The soul hath illnesses like as the body hath, and the cure of these last is known; but of the soul's illness there be also many kinds, and of these I will mention a few.' These are ignorance, disobedience, haste, cunning, avarice, tyranny, lying, pride, deceit, and envy. Deceit is said to be of two kinds: that which deceives others, and that which deceives ourselves. But of all evils, ignorance is the greatest; 'for it is the soul's death, as learning is its life; and for this disease is chess an especial cure, since there is no way by which men arrive more speedily at knowledge and wisdom; and in like manner, by its practice, all the faults which form the diseases of the soul are converted into their corresponding virtues.' It is not to be doubted that chess-playing may keep individuals out of mischief; but, whatever may have been the case in ancient times, we

do not hear of its transforming vicious characters into virtuous ones in our days.

The eighth advantage is social, inasmuch as it brings men of different degrees together, and promotes their intimacy and friendship; and 'advantage the ninth, is in wisdom and knowledge, and that wise men do play chess; and to those who object that foolish men also play chess, and, though constantly engaged in it, become no wiser, it may be answered, that the distinction between wise and foolish men in playing chess, is as that of man and beast in eating of the tree—that the man chooses its ripe and sweet fruit, while the beast eats but the leaves and branches, and the unripe and bitter fruit; and so it is with players at chess—the wise man plays for those virtues and advantages which have been already mentioned, and the foolish man plays it but for mere sport and gambling, and regards not its advantages and virtues. This is the condition of the wise man and foolish man in playing chess.' From this it seems a descent to the tenth advantage, which is, that chess combines war with sport; and pleasant allegories are made subservient to the inculcation of sound truths and important principles.

Next comes an explanation of the mode in which Great Chess was played, with the nature and value of the various moves. Among the hard technicalities with which it abounds, the writer takes occasion to condemn the practice of giving a different value to the piece which may have reached the end of the board; 'for,' as he says, 'what is more natural or just than that men should occupy the station of their predecessors, and that the son of a king should become a king, and a general's son attain the rank of a general.' An instance of rigid caste-law carried into a harmless recreation.

In another manuscript, chess is shewn to have something to do with a man's fortunes: he who could watch a game without speaking, was held to be discreet, and qualified for a government office. And conquerors are enjoined not to boast of their success; not to say, even if such be the case, that they have won all the games, but that they have 'won some.' Exemplary virtue is not, however, claimed for chess-players, as in the former instance, for some are said to be continually 'swearing false oaths, and making many vain excuses'; and again, 'You never see a chess-player rich, who is not a sordid miser, nor hear a squabbling that is not a question of the chess-board.' On the other hand, there were 'rules of politeness in chess,' which it behoved all persons to follow:—'He who is lowest in rank is to spread the board, and pour out the men on it, and then wait patiently till his superior has made his choice; then he who is inferior may take his own men, and place all of them except the king, and when the senior in rank has placed his own king, he may also place his opposite to it.' During the game, 'all foolish talk and ribaldry' is to be avoided, and onlookers are 'to keep silence, and to abstain from remarks and advice to the players; and an inferior, when playing with a superior, is enjoined to exert his utmost skill, and not 'underplay himself that his senior may win'—an observation which what is called the 'funkey class' might remember with advantage. And further, chess is not to be played 'when the mind is engaged with other objects, nor when the stomach is full after a meal, neither when overcome by hunger, nor on the day of taking a bath; nor, in general, while suffering under any pain, bodily or mental.'

Chess-playing without looking at the board, now taught by professors, and supposed to be a comparatively modern art, was, as we have seen above, known and practised many centuries ago; and among the instructions last quoted are those for playing the 'blindfold-game.' The player is 'to picture to himself the board as divided first into two opposite sides, and then each side into halves, those of the king and

the queen, so that when his naib, or deputy, announces that 'such a knight has been played to the second of the queen's rook,' or 'the queen to the king's bishop's third,' he may immediately understand its effect on the position of the game. This mode of playing, however, is not recommended to those who do not possess a powerful memory, with great reflection and perseverance, 'without which no man can play blindfold.' These, with other instructions, are followed by the author's remark, 'that some have arrived to such a degree of perfection as to have played blindfold at four or five boards at a time, nor to have made a mistake in any of the games, and to have recited poetry during the match; and he adds: 'I have seen it written in a book, that a certain person played in this manner at ten boards at once, and gained all the games, and even corrected his adversaries when a mistake was made.'

Besides their conventional value, the pieces had a money value, which was essential to be known by all who desired to win. The rook and knight were estimated at about sixpence each; the queen, threepence; the pawns, three-halfpence; and the 'side-pawns,' three farthings. The value of bishops varied, while the king was beyond all price. The regulations respecting odds were also well defined, in degrees from a single pawn up to a knight and rook; but any one claiming the latter odds was held not 'to count as a chess-player.' And it was not unusual for works on chess to contain puzzling problems, representations of drawn games, and well-combined positions. Some authors describe five different kinds of chess: one had 10 × 10, or 100 squares; another was oblong, 16 × 4, which employed dice as well as the usual pieces; another board was circular, with a central spot for the king, where he could intrench himself in safety; another represented the zodiac, with spaces for each planet, according to the number of houses or mansions assigned by astrologers. The ingenuity did not end here: chess was made to illustrate dreams, and to embellish many amusing games and recreations. Odes and poems were written upon it, and the poets at times exhibited their skill in a play upon words—for instance:

'When my beloved learnt the chess-play of cruelty,
In the very beginning of the game her sweet cheek
(ruk) took my heart captive.'

It served also to point riddles, some of which exhibit remarkable ingenuity, as shewn by the following example, where the name of Mohammed is enigmatically embodied. It is thus rendered:

'The vow of Moses twice repeat;
The principles of life and heat;
The squares of chess, in order due,
Must take their place between these two;
When thus arranged, a name appears,
Which every Muslim heart reveres.'

The solution, as given by a reverend ulama of Constantinople to a learned German who could not solve the mystery, is: 'Take the "vow of Moses," which is 40; double it, and it becomes 80, equivalent to the two Mims in the name Muhammed. Place under these the bases of the temperaments—that is, the elements—which are four (the power of the letter D); then take the number of the houses (or squares) of chess, which are eight in a row, and place it (8 being equal to the letter H) between the two Ms, and you have the name of the prophet, Muhammed (MHMD.)'

'It has been necessary,' observes Mr Bland, 'to turn the Arabic commentary a little, in order to make the solution more intelligible to those unacquainted with the trick of Eastern riddles. Some further explanation is also required to illustrate the solution itself. The vow of Moses refers to his forty days' fast; the four temperaments—the bile, the atrabile, phlegm, and blood—are represented in the Arabian system of physics

by the four elements, which are considered to be connected with them; the figures refer to the numerical power of the *abjad*, or alphabet; and the enigma itself has been attributed, though on uncertain grounds, to Ali, the son-in-law of the prophet.*

'THE SUCCESSFUL MERCHANT.'

UNDER this title has lately been produced a novelty in our literature, the memoirs of an eminent commercial man.* Samuel Budgett died in May 1851, at the age of fifty-seven. Though starting in life without capital or credit, he had, by the sheer exercise of his own innate qualities, risen to the head of one of the most colossal concerns in England. Had he been merely a clever bargainer, and a skilful organiser of business arrangements, there might have been some value in his memoirs, as a guidance to young mercantile aspirants; but Budgett was something more than all this, and his biography serves the far higher purpose of shewing how a man may be at once a most adroit merchantiser, and a man of liberal practice, and a true lover of his kind. Let it not be supposed that he was a *soft* man, who had prospered through some lucky accident. He really was a thorough-paced follower of the maxim which recommends buying in the cheapest and selling in the dearest market: he was reputed as *keen* in business. But he was also kind-hearted and high-principled, and it is this union of remarkable qualities which gives his memoirs their best value.

Mr Budgett was a general provision-merchant at Bristol, with also a large warehouse at Kingswood Hill, where his private residence was. His biographer presents him as he came daily into town to attend to business. 'You might have often seen driving into Bristol, a man under the middle size, verging towards sixty, wrapped up in a coat of deep olive, with gray hair, an open countenance, a quick brown eye, and an air less expressive of polish than of push. He drives a phaeton, with a first-rate horse, at full speed. He looks as if he had work to do, and had the art of doing it. On the way, he overtakes a woman carrying a bundle. In an instant, the horse is reined up by her side, and a voice of contagious promptitude tells her to put up her bundle and mount. The voice communicates to the astonished pedestrian its own energy. She is forthwith seated, and away dashes the phaeton. In a few minutes, the stranger is deposited in Bristol, with the present of some pretty little book, and the phaeton hastens on to Nelson Street. There it turns into the archway of an immense warehouse. "Here, boy; take my horse, take my horse!" It is the voice of the head of the firm. The boy flies. The master passes through the offices as if he had three days' work to do. Yet his eye notes everything. He reaches his private office. He takes from his pocket a memorandum-book, on which he has set down, in order, the duties of the day. A boy waits at the door. He glances at his book, and orders the boy to call a clerk. The clerk is there promptly, and receives his instructions in a moment. "Now, what is the next thing?" asks the master, glancing at his memorandum. Again the boy is on the wing, and another clerk appears. He is soon dismissed. "Now, what is the next thing?" again looking at the memorandum. At the call of the messenger, a young man now approaches the office door. He is a "traveller;" but notwithstanding the habitual push and self-possession of his class, he evidently is approaching his employer with reluctance and embarrassment. He almost pauses at the entrance. And now that he is face to face with the strict man of business, he feels much confused.

"Well, what's the matter? I understand you can't make your cash quite right."

"No, sir."

"How much are you short?"

"Eight pounds, sir."

"Never mind; I am quite sure you have done what is right and honourable. It is some mistake; and you won't let it happen again. Take this and make your account straight."

'The young man takes the proffered paper. He sees an order for ten pounds; and retires as full of admiration as he had approached full of anxiety.

"Now, what is the next thing?" This time a porter is summoned. He comes forward as if he expected rebuke. "Oh! I have got such a complaint reported against you. You know that will never do. You must not let that occur again."

'Thus, with incredible dispatch, matter after matter is settled, and all who leave that office go to their work as if some one had oiled all their joints.

'At another time, you find the master passing through the warehouse. Here, his quick glance descries a man who is moving drowsily, and he says a sharp word that makes him, in a moment, nimble. There, he sees another blundering at his work. He had no idea that the master's eye was upon him, till he finds himself suddenly supplanted at the job. In a trice, it is done; and his master leaves him to digest the stimulant. Now, a man comes up to tell him of some plan he has in his mind, for improving something in his own department of the business. "Yes, thank you, that's a good idea;" and putting half-a-crown into his hand, he passes on. In another place he finds a man idling. You can soon see, that of all spectacles this is the one least to his mind. "If you waste five minutes, that is not much; but probably if you waste five minutes yourself, you lead some one else to waste five minutes, and that makes ten. If a third follow your example, that makes a quarter of an hour. Now, there are about a hundred and eighty of us here; and if every one wasted five minutes in a day, what would it come to? Let me see. Why, it would be fifteen hours; and fifteen hours a day would be ninety hours—about eight days, working-time, in a week; and in a year, would be four hundred days. Do you think we could ever stand waste like that?" The poor loiterer is utterly confounded. He had no idea of eating up fifteen hours, much less four hundred days, of his good employer's time; and he never saw before how fast five minutes could be multiplied.'

Mr Budgett was the son of a worthy couple, not exactly in poor, but in rather difficult circumstances. He had little school education; but his mother gave him a good religious training. From his earliest intelligent years, he loved traffic. His first transaction was getting a penny for a horse-shoe which he had found. Discovering that for a half-penny he got six marbles, but for a penny fourteen, he bought pennyworths and sold them in half-pennyworths to his companions, thus realising a profit. Meeting an old woman with a basket of cucumbers, he bought them, and by selling them again, realised ninpence. Truly in his case the boy was father to the man. But, what was notable in him, he would give away his accumulated profits all at once, in the purchase of a hymn-book, or for the relief of some poor person. Even then, it was not for sordid or selfish ends that he trafficked. In these early years, his singular tact also came out. 'I remember,' he said, 'about 1806 or 1807, a young man called on my mother, from Mr D—— of Shepton, to solicit orders in the grocery trade. His introduction and mode of treating my mother were narrowly watched by me, particularly when she asked the price of several articles. On going in to my father, she remarked, there would be no advantage in dealing with Mr D——, as she could not see that his prices were any

* *The Successful Merchant: Sketches of the Life of Mr Samuel Budgett, late of Kingswood Hill.* By William Arthur, A.M. Hamilton, Adams, & Co. London: 1852.

lower than those she was in the habit of giving. I slipped aside, and began to think: "Why, that young man might have got my mother's trade, if he had known how; if, instead of mentioning so many articles, he had just offered one or two at a lower price than we have been in the habit of giving, she would have been induced to try those articles; and thus he would have been introduced, most likely, to her whole trade: beside, his manner was rather loose, and not of the most modest and attractive kind." I believe the practical lesson then learned has, since that, been worth to me thousands of pounds—namely, Self-interest is the mainspring of human actions: you have only to lay before persons, in a strong light, that what you propose is to their own interest, and you will generally accomplish your purpose.' There are certainly few boys of twelve years who would have caught up such an idea as this from so common-place a circumstance.

By the time he was fourteen, he had realised thirty pounds by private barter. He gave the money to help his parents. When put as apprentice to an elder brother, a grocer in Kingswood Hill, it might have been expected that he would speedily distinguish himself; and so he might have done as far as intellect was concerned; but, unluckily, his strength was at first inadequate for his duties, and his brother actually sent him away as hopeless. With great difficulty, he made his way into another trader's employment, and there he gave entire satisfaction. His brother, then, reclaimed him, and though offered a higher salary where he was, he returned to serve out his time. Long before that period had arrived, he was beginning to soar above retail business. 'The markets were well watched, every advantage of time or change turned to account, and his singular power of cheap buying exerted with all vigour. The trade steadily grew; every now and then those in their own line were surprised at the sales they were able to make, and the neighbourhood resounded with the news of the great bargains to be had at Budgett's. As custom increased, so did envy and accusation. Many scrupled not to declare, that they sold cheaper than they bought, and therefore must soon come to an end; yet they went on, year by year, in steady and rapid increase. . . . He already seemed to decry in the distance the possibility of a great wholesale establishment; but this must be reached by little and little. He would not attempt what he could not accomplish. Any sudden bound, therefore, by which he was at once to pass the gulf now separating him from his object, was not to be thought of. A little at a time; secure what you have, work it well, make it fruitful, and then push on a little farther; but never stretch out to anything new till all the old is perfectly cultivated.'

The brother, who was fifteen years his senior, and a man of ordinary character, was borne on by the towering genius of Samuel the apprentice. 'Among the customers of the shop were numbers of good women, who came from villages at a few miles' distance, mounted on donkeys. As the flow of purchasers was great, a crowd of these patient steeds would often be for a long time about the door, while their respective mistresses were obtaining goods. In this concourse from a distance, the quick eye of Samuel discovered the germ of an extended trade. Why should he not go into their neighbourhood regularly, and obtain their orders; so securing their custom always, and affording them accommodation, while he obtained new chances of extension? His brother was much more inclined to pursue the regular course than to branch into anything new; and the caution of the one probably acted as a useful counterbalance to the energy of the other. But Samuel was not to be held within the shop-walls: he had his plans for erecting a great business, and no power could restrain him. He soon set forth to the villages of Doynton and Pucklechurch, and arranged

to meet the good folks at fixed times, in one house or another convenient for them, and there to receive their orders. He made himself their friend: he was hearty, familiar, and in earnest; he noticed their children; he knew their ways; and he rapidly gained their favour, and effected considerable sales.'

'This point gained, he began to talk of supplying the smaller shops. "Why should not we supply them as well as other people?" His brother shrank from anything that seemed to approach the wholesale. He feared that they would get beyond their means, and wished to pursue only the old course. Samuel could wait, but he could not surrender. Supply the smaller shops he would, and by degrees he managed to accomplish it. Very gradually, the range of this quasi-wholesale trade extended. Firmly keeping to his purpose of working all he had got, and going on little by little, he made no abrupt enterprise—no great dash; but on, on he plodded in the humblest way, caring nothing for show, but careful that every foot of ground under him was solid. He gradually began to make a modest sort of commercial journey; and among tradesmen to whom he would not venture to offer the higher articles of grocery, raised a considerable trade in such descriptions of goods as he might supply without seeming to push into too important a sphere.'

Having made a lucky purchase of butter, Samuel went amongst traders of his own kind for orders, and at first met with little but contempt. He persevered, nevertheless, and in a little time made his way. By little and little his house, of which he became a partner, acquired a footing, and began to be talked of as a kind of prodigy for a village. The leading principle followed, was to do business entirely by ready-money, in buying as in selling. A wonder may be felt how Mr Budgett contrived, with no advantage of capital at starting, to act upon this rule. The plan is simple, and may be easily followed. Let the transactions be in a proper proportion to the means. It looks a slow plan; but, in reality, by securing an exemption from pecuniary embarrassment, it allows a business, other circumstances being equal, to go on faster than might otherwise be the case. Mr Budgett could accept small profits on his ready-money transactions, and by their frequency, outstrip heavier-pursed but also heavier-minded men.

The leading maxims of Samuel Budgett in business were—*Tact, Push, and Principle*. In the two former, he was a great genius, and much he no doubt was indebted to them. Yet we are inclined to think that Principle had the chief hand in his success. He was entirely a just man. He would rebuke a young salesman more severely for a slight inequality in his weighing-scales against the public, than for a neglect of his duty. It was a custom of grocers to mix up pepper with an article called P. D. Mr Budgett long kept a cask of P. D.; but at length, reflecting seriously on it one evening, he went to the shop, re-opened it, took out the hypocritical cask to a neighbouring quarry, and there staved it, scattering the P. D. amongst the clods, and slags, and stones; after which he returned with a light heart to bed. There was also a benevolence at the bottom of all Mr Budgett's proceedings as a man of business. It appeared strongly in his relations to his subalterns and working-people. Though a strict disciplinarian, and not to be imposed upon in anything, he was so humane and liberal towards all around him, that they served him as much from love as duty. He has discharged men for misconduct or disloyalty, and afterwards pensioned their families till they got other employment. His liberality in supporting charitable institutions, and relieving private cases of distress, knew hardly any bounds; but, at a fair computation, it has been estimated at about £2000 a year.

Observing one of his men looking for some time very melancholy, he called him up, and inquired into the cause. 'The sickness of his wife had entangled

him in debt; he could not eat, he could not sleep; his life was a misery to him, and he had exclaimed with a pathos that sunk deep into my dear relative's tender heart: "Master, I am in debt; every time I go near the river, something bids me fling myself into it, telling me there's water enough to rid me of all my troubles; and that if I don't, I shall be sent into the prison there for debt!"

"Deeply affected, he inquired of the poor man the names of his creditors, the amount of their respective claims, and the peculiar circumstances which had led to the contraction of each liability. Having ascertained these particulars, and perfectly satisfied himself that the man had not forgotten the precept of the society of which he was a member—"Not to contract debt without at least a reasonable prospect of discharging it"—he asked him whether freedom from these liabilities would restore to him peace of mind. The question was answered by a sort of sickly smile, which seemed to indicate a perfect despair of such a consummation. "Well, come," said the master, "I don't think things are quite so bad, —, as they appear to be to you. See here, my poor fellow, you owe — pounds: it's a very large sum for a man like you, to be sure; and if you had run into debt to anything like this amount through extravagance, or even thoughtlessness, I should have regarded it as an act of dishonesty on your part, and I *might* have felt it right to discharge you. But you are to be pitied, and not to be blamed. Cold pity alone goes for nothing, so let us see how you can be helped out of your troubles. Now, do you think your creditors, considering all the circumstances, would take one-half, and be satisfied? Here's Dr Edwards—his bill is the heaviest; if we can get him to take one-half?"

"One-half, master!" exclaimed the poor man, "but if they *would* take half, where's the money to come from? I *arn't* got a shilling in the world but what's coming to me Friday night; and when I take my wages now, I *arn't* any pleasure in looking at the money, because it *arn't* my own; it should go to pay my debts, and I'm obliged to use it to buy victuals. I think in my heart I shall ne'er be happy again."

"Still more sensibly affected by the poor man's manner the longer the interview lasted, my kind-hearted relative begged him not to distress himself any more; he said that a Friend of his had given him a sum that was quite equal to one-half his debts, bade him return to his work, order a horse to be put into harness as he passed through the yard, and brought round in ten minutes; and told him to be sure to make himself as happy as he could till he saw him again. He immediately drove round to every creditor the poor man had, compounded with them for their respective claims, and obtained their receipts in full discharge. On his return, the poor man's stare of bewilderment was indescribable. He watched his master unfold the receipts one by one without uttering a syllable; and when they were put into his hand, he clutched them with a sort of convulsive grasp, but still not a word escaped him. At length he exclaimed: "But, master, where's the money come from?"

"Never do you mind that, —," was the reply; "go home, and tell your wife you are out of debt; you are an independent man. I only hope the creditors have felt something of the satisfaction in forgiving you one-half your debt to them, that we know God feels in forgiving our debts to him for Christ's sake: I have said that much to all of them."

"But the puzzling question had not yet been answered, and again it was put: "But, master, where's the money come from?"

"Well, well, I told you a FRIEND had given it to me for you. You know that Friend as well as I do. There now, you may leave your work for to-day: go home to your wife, and thank that Friend together for

making you an independent man. But stay, —, I had almost forgotten one thing. I called to see Mr P—— as I drove through Stoke's Croft; I told him the errand that had carried me away from home all day, and he gave me a sovereign for you to begin the world with."

"The poor fellow was too much affected to say anything more. The next morning, however, he appeared again, but after a most complete failure in a valorous attempt he made to express his thanks, he was obliged to leave the counting-house, stammering out that "both he and his wife felt their hearts to be as light as a feather."

Mr Budgett was, by family connection, a Wesleyan, and at all periods of his life under a strong sense of religion. He had even acted as a lay-preacher. It was his custom to have all the people of his establishment assembled for religious exercises every morning before proceeding to business. He was active as a Sunday-school teacher, and assisted with his purse and his own active exertions in every effort to Christianise the rude people of Kingswood. When he became a highly-prosperous man, he had a good country-house and a handsome establishment; but wealth and its refinements never withdrew him from familiar personal intercourse with his people. Neither did it ever in the least alienate him from his many humble relations. His conduct, indeed, in all these respects was admirable, and well entitled him to be, what he was, the most revered man of his neighbourhood and kindred. At his death, the expression of mourning was widely spread, as if the whole population had felt in his loss the loss of a friend.

The volume which supplies us with these particulars and extracts, is a very interesting one; yet we could wish to see it abridged of some portion of the long episodes, in the style of pulpit discourses, with which the author has thought proper to expand it. If properly condensed, and the details of the life presented given perhaps in somewhat better order, so as to explain more clearly the steps of Mr Budgett's rise as a merchant, the work might become a *vade-mecum* for the young man of business, exhibiting to him a model of character and conduct such as could not but exercise a good influence over his future career.

PET BIRDS OF INDIA.

It is said, that when women addict themselves to vice of any kind, they carry it to extravagance, and become far worse than bad men. In like manner, when the natural softness and amiability of the Hindoo character yield to the temptations of luxury and dominion, the individual grows into a tyrant as cruel and odious as any of those depicted in history. This apparent discrepancy has given rise to many speculative mistakes; but, in our opinion, it is as certain that the mass of the Hindoos are gentle and kindly in their nature, as it is that the mass of women are so. It is a curious thing to see the gallant sepoy on a march, attended by his pet lambs, with necklaces of ribbons and white shells, and ears and feet dyed of an orange colour. But even wild creatures are at home with the kindly Hindoo. Fluttering among the peasants threshing corn in a field, are flocks of wild peacocks, gleaming their breakfast; and in the neighbourhood of a village, a traveller can hardly distinguish between the tame and wild ducks, partridges, and peacocks. "There is a fine date-tree," says a recent writer, "overhanging a kind of school, at the end of one of the streets in the town of Jubbulpore, quite covered with the nests of the baya bird; and they are seen every day, and all day, fluttering about in scores, while the noisy children at their play fill the street below, almost within arm's reach of them."

Almost all the natives of India are fond of rearing

pet birds; and the pet is, more frequently than otherwise, a parrot, which is prized for its conversation. The same taste prevailed, we are told, in the fifteenth century, in the city of Paris, where talking-birds were hung out almost at every window. The authority says, that this was attended with rather an awkward result. 'Leading the public life they did, in which they were exposed to every sort of society, the natural morality of the birds was so far lost, that they had become fluent in every term of reproach and indecency; and thunders of applause were elicited among the crowd of passengers by the aptness of their repartees.' In India, the taste is the same, but the habits different; a sketch of which we furnish from our Old Indian. The carpenter, she tells us, while planing the plank, which he holds between his toes, amuses himself by talking to his parrot. The shoemaker, while binding his slippers, or embroidering his rich velvet shoes, for the feet of some sable beauty, pauses every now and then, to listen to the chattering of his pet. The *guala*, on returning home, after disposing of his butter or butter-milk, first takes up some bamboo twigs, one of which is appropriated to each customer, and marking, by a notch with a knife, the quantity disbursed to each, turns, as a matter of course, to his favourite parrot, and either listens to the recital of his previous lessons, or begins to teach him some fresh invocation to some score of gods and goddesses. These men seldom condescend to teach their favourites anything else; but should a lady be the owner, the parrot's lessons are more varied, and more domestic in their character. He is taught to call his mistress 'mother,' and himself 'Baba mittoo' (sweet child.) He is sometimes instructed to rail at her neighbours, and sometimes to scold the children; and thus she lives in sweet companionship with her bird, feeding him with steeped grain, rice and milk, sugar-cane and Indian corn. Of the two last he is exceedingly fond.

India abounds in a variety of parrots and perroquets, the names of many of which I have forgotten; but the generic name is *Tota*. The more common are the *kudlak*, *teeah*, and *pahari*. These learn to speak glibly, being generally taken out of the nest before they are fully fledged. Crutches of various kinds are selected for the poor captive, the most ingenious of which is made of a single joint of bamboo, the two ends being formed into cups—the middle part being cut, and then bent and arched over the fire; the perch being formed of a straight piece of bamboo, which joins the two cups below. A hook fastened to the top of the arch enables the owner to suspend it from the thatched ceiling of his hut; and thus the parrot swings about, listening to his master's pious ejaculations. At dusk, many of these men may be seen parading through the bazaar, with their pets in their hands, the latter loudly vociferating that Brahma is the greatest of gods, or that Krishna and Radha were a loving couple; and so on. I have often been amused at this mode of displaying religious zeal and pious adoration.

Should you penetrate into the more crowded parts of the bazaar, you might happen to see the taste of the bird-fancier displayed after a different, but, I am happy to say, exceptional fashion. A shop may sometimes be found having a square space enclosed with a railing, with a divan in the middle, for the accommodation of the master and his visitors. On this railing a number of birds are perched, many of them little tame bulbuls; these are detained by a ligature, passing over the shoulders of the bird, and tied under the breast, leaving his wings and legs free. The bulbul, though not the bird known by that name in Persia, is a pretty songster; but he is as desperate a fighter as a gamecock. Those, therefore, who delight in cruel sports, bring their little pets to these shops, where no doubt birds of the best mettle are to be found; and on the result of a battle, money and sweetmeats are lost and won, while many

a poor little bird falls a sacrifice to its master's depraved taste. The tiny *amadavad*, with his glowing carmine neck, and distinct little pearly spots, may also occasionally be seen doing battle; he fights desperately, though he also warbles the sweetest of songs.

The affluent Hindoo Baboo or Mohammedan Nawab, among other luxuries, keeps also his aviary. In these may be seen rare and expensive parrots, brought from the Spice Islands. They delight also in *diyuls* and *shamahs*. The latter is a smaller bird than our thrush, but larger than a lark; his breast is orange, the rest of his plumage black, and in song he is equal to our black-bird. The *diyul* also sings sweetly; he is about the same size as the *shamah*, his plumage black, with a white breast, and white tips to his wings. A well-trained bird of either kind sells for about ten rupees, and twenty will be given for a cuckoo from the Nepaul hills. A Baboo whom I knew had several servants to look after his aviary, one of whom had to go daily in search of white ants and ants' eggs for his insectivorous charge; for the *shamah* and *diyul* are both insect-eaters.

Some of the *Minas* (*Gracula*), of which there are several kinds in India, articulate as distinctly, and are as imitative, as the parrots. One of these birds was once brought as a present to my little girl. The donor took his leave, assuring us that the bird was a great speaker, and imitated a variety of sounds. This I found to be too true, for I was awakened by him next morning at dawn of day. He had evidently been bred in the neighbourhood of the hospital, and also initiated into the mysteries of the parade. He coughed like a consumptive patient, groaned like one in agony, and moaned as if in the last extremity. Then he would call a 'halt!' and imitate the jingling of the ramrods in the muskets so exactly, that I marvelled how his little throat could go through so many modulations. I was soon obliged to banish him to a distance from the sleeping-apartments, for some of his utterances were anything but suggestive of soothing or pleasurable sensations.

The hill mina, a mountaineer by birth, seldom lives long in confinement in lowland districts. After having endeared himself to his master and his family by his conversational powers and imitative qualities, he is not unfrequently cut off suddenly by a fit, and sometimes expires while feasting on his bread and milk or pea-meal-paste, or perhaps when he has only a few minutes before been calling out loudly his master's name or those of the children. The hill mina is a handsome bird, a size larger than our black-bird; he is of one uniform colour—a glossy black, like the smoothest Genoa velvet, harmonising beautifully with the bright yellow circle of skin round his eyes, his yellow beak and yellow legs.

The grackle or *salik*, which is a great favourite in the Isle of France, has been correctly enough described in *Partington's Cyclopaedia*. It is a gregarious bird, greatly enlivening the aspect of the grassy meadows at sunset, when his comrades assemble in large flocks, and having picked up their last meal of grubs and grasshoppers, resort for shelter to a neighbouring avenue, where they roost for the night. The grackle is a tame and familiar bird, and will sometimes build its nest close to the habitation of man. I have seen one on the top of a pillar, under the shelter of a veranda; and occasionally an earthen-pot is placed for its accommodation in the fork of a neighbouring tree. Though their brood may be constantly removed, they will return, year after year, to the same nest, expressing, however, their discontent and distress when robbed, by keeping up for some days a loud and querulous chattering.

Those who dwell on the banks of the Ganges may sometimes see, during the rainy season, a large boat floating past, having a raised cabin, like a Bengalee

hut, constructed of mat and straw. From the multiplicity of cages inside and outside, it may be gathered that here are fresh supplies for the bird-fancier—captives from the hills of Rajmahal and Moryheer. The constant fluttering among the inmates of the crowded cages, and their mournful and discordant notes, indicate that they are anything but a happy family—that they have been only recently caught, and are not yet habituated to confinement. They are soon, however, disposed of at the different stations or towns at which the boat anchors, and become in due time the solitary and apparently happy pets I have already described.

I need only add, that there is no lack of pretty little bird-cages in the Far East, constructed very tastefully by the neat-handed natives, and sold for two or three annas.

JUVENILE ENERGY.

In December 1807, W. H. Maynard, Esq., was teaching a school for a quarter in the town of Plainfield, Massachusetts. One cold, blustering morning, on entering his school-room, he observed a lad he had not seen before, sitting on one of the benches. The lad soon made known his errand to Mr Maynard. He was fifteen years old; his parents lived seven miles distant; he wanted an education, and had come from home on foot that morning, to see if Mr Maynard could help him to contrive how to obtain it. Mr Maynard asked him if he was acquainted with any one in the place. 'No.' 'Do your parents know any one here?' 'No.' 'Can your parents help you towards obtaining an education?' 'No.' 'Have you any friends that can give you assistance?' 'No.' 'Well, how do you expect to obtain an education?' 'I don't know, but I thought I would come and see you.' Mr Maynard told him to stay that day, and he would see what could be done. He discovered that the boy was possessed of good sense, but no uncommon brilliancy; and he was particularly struck with the cool and resolute manner in which he undertook to conquer difficulties which would have intimidated common minds. In the course of the day, Mr Maynard made provision for having him boarded through the winter in the family with himself, the lad paying for his board by his services out of school. He gave himself diligently to study, in which he made good but not rapid proficiency, improving every opportunity of reading and conversation for acquiring knowledge; and thus spent the winter. When Mr Maynard left the place in the spring, he engaged a minister, who had resided about four miles from the boy's father, to hear his recitations; and the boy accordingly boarded at home and pursued his studies. It is unnecessary to pursue the narrative further. Mr Maynard never saw the lad afterwards. But this was the early history of the Rev. Jonas King, D.D., whose exertions in the cause of Oriental learning, and in alleviating the miseries of Greece, have endeared him alike to the scholar and the philanthropist, and shed a bright ray of glory on his native country.

LITERARY CIRCLES OF LONDON.

The society of the literary world of London is conducted after this wise:—There are certain persons, for the most part authors, editors, or artists, but with the addition of a few who can only pride themselves upon being the patrons of literature and art—who hold periodical assemblies of the notables. Some appoint a certain evening in every week during the season, a general invitation to which is given to the favoured; others are monthly; and others, again, at no regular intervals. At these gatherings, the amusements are conversation and music only, and the entertainment is unostentatious and inexpensive, consisting of tea and coffee, wine or negus handed about in the course of the evening, and sandwiches, cake, and wine at eleven o'clock. Suppers are prohibited by common consent, for costliness would speedily put an end to society too agreeable to be sacrificed to fashion. The company meets usually between eight and nine, and always parts at midnight.—*The Critic.*

THE SKY-LARK'S SONG.

It comes down from the clouds to me,
On this sweet day of spring;
Methinks it is a melody
That angel-lips might sing.

Thou soaring minstrel! winged bard!
Whose path is the free air,
Whose song makes sunshine seem more bright,
And this fair world more fair!

I ask not what the strain may be,
Thus chanted at 'Heaven's gate'—
A hymn of praise, a lay of joy,
Or love-song to thy mate.

Vain were such idle questioning!
And 'tis enough for me
To feel thou singest still the notes
Which God gave unto thee.

Thence comes the glory of thy song,
And therefore doth it fall,
As falls the radiance of a star,
Gladdening and blessing all!

Oh! wondrous are the living lays
That human lips have breathed,
And deep the music men have won
From lyres with laurel wreathed:

But there's a spell on lip and lyre,
Sweet though their tones may be—
Some jarring note, some tuneless string,
Aye mars the melody.

The strings sleep 'neath too weak a touch,
Or break, 'neath one too strong;
Or we forget the master-chord
That should rule all our song.

When shall our spirit learn again
The lay once to it given!
When shall we rise, like thee, sweet bird!
And, singing, soar to heaven!

FANNY FARMER.

DOG-SELLING EXTRAORDINARY.

Two ladies, friends of a near relative of my own, from whom I received an account of the circumstance, were walking in Regent Street, and were accosted by a man who requested them to buy a beautiful little dog, covered with long, white hair, which he carried in his arms. Such things are not uncommon in that part of London, and the ladies passed on without heeding him. He followed, and repeated his entreaties, stating, that as it was the last he had to sell, they should have it at a reasonable price. They looked at the animal; it was really an exquisite little creature, and they were at last persuaded. The man took it home for them, received his money, and left the dog in the arms of one of the ladies. A short time elapsed, and the dog, which had been very quiet, in spite of a restless, bright eye, began to show symptoms of uneasiness, and as he ran about the room, exhibited some unusual movements, which rather alarmed the fair purchasers. At last, to their great dismay, the new dog ran squeaking up one of the window curtains, so that when the gentleman returned home a few minutes after, he found the ladies in consternation, and right glad to have his assistance. He vigorously seized the animal, took out his penknife, cut off its covering, and displayed a large rat to their astonished eyes, and of course to its own destruction.—*Mrs Lee's Anecdotes of Animals.*

Printed and Published by W. and R. CHAMBERS, High Street, Edinburgh. Also sold by W. & ORR, Amen Corner, London; D. N. CHAMBERS, 55 West Nile Street, Glasgow; and J. M'GLASHEAN, 50 Upper Beakville Street, Dublin.—Advertisements for Monthly Parts are requested to be sent to MAXWELL & Co., 31 Nicholas Lane, Lombard Street, London, to whom all applications respecting their insertion must be made.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 430. NEW SERIES.

SATURDAY, MARCH 27, 1852.

PRICE 1½d.

PRONOUNCERS.

Do you not find, in almost every company, one who pronounces decisively upon every matter which comes in question? His voice is loud and firm, his eye bold and confident, and his whole manner oracular. No cold hesitations as to points of fact ever tease him. Little time does he require to make up his mind on any speculative subject. He is all *yes* or all *no* at once and without appeal. Opposite opinions he treats with, at the best, a sublime pity, meant to be graceful, but, in reality, galling. He is often a goose; but, be what he may, it is ten to one that he carries off the majority of the company in the mere sweep of his gown. They are led by him for the time, fascinated by the energy of his pronunciations. They may all recover from him afterwards—some after one day, some after two, and particularly weak men after, perhaps, a week. At the moment, however, the pronouncer has vast influence, and, if immediate action can be determined on, it is very likely that he drags his victims into some commitment of themselves, from which subsequent escape may not be very easy.

While pronouncing is thus the prominent quality of a few, it is more or less the vice of nearly all. Men feel that they have an inherent right to their opinion, and to the promulgation of it, and are not very apt to reflect that there is another question—as to whether their opinion be worth delivering; whether it has been formed upon a good basis of knowledge or experience, or upon any basis at all; whether it is the emanation of ripe judgment and reflection, or of some mere passing gust of ideas springing from the whim of the minute. Hence, when any question arises, it is seldom found that any one is quite unprepared to give some sort of decision. Even the giddy girl of seventeen will have something to say upon it, albeit she may never have heard of the matter before. It is thought foolish-looking not to be able to pronounce, as if one imperiled the right of private judgment itself by not being prepared in every case to act upon it. In consequence, what absurd opinions do we hear in all kinds of companies upon all kinds of topics! How the angels, who know better, must weep!

A conversational party even of tolerably well-educated persons, often presents itself in a ludicrous light. Some question has arisen amongst them. No one has any clear or definite information upon it. They have had disputes about the simplest matters of fact involved in it. Yet no person there, down to the youngest, but would take scorn to be held as incapable of pronouncing upon it. There are as many opinions as there are persons present, and not one less confident than

another. What is very natural in such circumstances, no one has the least respect for the opinions of any of the rest. Each, in fact, does justice upon his neighbour for the absurdity of pronouncing without grounds, while incapable of seeing the absurdity in himself. And thus an hour will be passed in a most unprofitable manner, and perhaps the social spirit of the company be not a little marred. How much better to say: 'Well, that is a subject I know nothing about: I will not undertake to judge.' Supposing all who are present to be in the same predicament, they might dismiss the barren subject, and start another on which some one could throw real light, and from which, accordingly, all might derive some benefit.

Is not this habit of pronouncing without preparation in inquiry and reflection just one of the causes of that remarkable diversity of opinion which is so often deplored for its unpleasant consequences? In ignorance—fancy, whim, and prejudice usurp the directing power. If we take no time for consideration, we shall be apt to plunge into an error, and afterwards persevere in it for the sake of consistency, or because it has become a thing which we regard as our own. In such circumstances, no wonder there are as many 'minds' as 'men.' But when any one can speak on the ground of well-ascertained facts, and after some deliberation on the bearings of the question, he must carry others with him, not by fascination, but by real conviction, and thus greatly reduce the proportion of opinions to men. Very likely, some other man has got hold of a somewhat different range of facts, and come to different conclusions: he, too, will have his party of followers. But there being two or three discrepant views on the subject, is a much less evil than there being as many as there are individuals.

The right of pronouncing upon public affairs is one that would be particularly clung to if there were any danger of its being lost, and it certainly is not in England that any writer would be found ready to challenge so valued a privilege. At the same time, no one will seriously deny, that if this right were used more generally with the advantage of a tolerable knowledge of the subject, it would be an improvement. Public men may be acting, as, indeed, they must generally do, upon certain data carefully brought out by inquiry: they may judge and act amiss after all, for human judgment is fallible. But when we contrast their means of forming a judgment with those of many persons who hesitate not to pronounce upon their measures, it cannot be denied that they stand in a strong position. When we hear a bold condemnation of their acts from men who, so far from having gone through the same process of inquiry, have not even perused the

documents in which the grounds of the administrative policy were explained, can we do otherwise than smile at the pretensions of the *pseudo-judges*? Is not the frequency of this unfounded judging much more apt to harden an unlucky statesman than to make him amenable to counsel? On the other hand, when a public man finds himself and his actions criticised by men who have knowledge, he must be a hardy one indeed who can entirely disregard the judgment.

If we attentively study the progress of any man who has acquired influence over his fellow-creatures—apart from certain matters in which the feelings are mainly concerned—we shall find that he has distinguished himself by a habit of not pronouncing where he has no means of forming a judgment. Such a man has had the good sense to see and confess that he could not be expected to know many things sufficiently well to entitle him to pronounce authoritatively upon them. He has probably given some considerable share of attention to certain subjects that are of some importance to his fellow-creatures, and thus fitted himself, with regard to them, to speak with more or less decision. Never found guilty of giving a vague, crudely-formed judgment on things a hundred miles out of his way, but, on the contrary, obtaining credit occasionally for the manner in which he treats those with which he is conversant, he irresistibly acquires character and influence. Young hasty minds laugh at his taking such care not to commit himself: he is perhaps taxed with getting credit for merely looking grave and holding his tongue. But this very holding of the tongue when there is nothing to say, is, in reality, one of the greatest, though often one of the last-learned virtues. Were his merits purely negative, they would be great; tending as they do to save truth from that obscurity which a multitude of ill-formed opinions necessarily throw upon it. But we shall usually discover in such men a positive merit also in their power to illustrate and give a guiding opinion upon certain subjects of importance to public or private interests.

There is not one sentence in this little essay which may not be justly set down as mere commonplace. We acknowledge the fault; but defend it on the ground that sound and useful commonplaces require a continual refreshing and re-presentation, so many persons being, after all, unaware or forgetful of them.

On a similar ground of defence, we would take leave to remind mankind of the good old maxim, 'Hear the other party.' Familiar to most people, observed by some, there are multitudes who uniformly act as if they had never heard of it. To be quite candid, we often catch ourselves neglecting it; and always, at the best, it takes a struggle to make it a reality in our conduct. Experience, however, impresses us more and more with a sense of its being absolutely essential to the ascertainment of truth in any disputable case. There is so much bias from self-love, so much recklessness about truth in general, and so much of even a sincere faithlessness of narration, that no partial account of anything is to be trusted. It is but a small concession to the cause of truth, to wait till we hear the statement of the opposite party, or not to pronounce without it. If anything were required to prove how little this is reflected on, it would be the readiness of nearly all persons to tell their own story, without intimating the slightest doubt that it is to be implicitly received on their own shewing. One cannot walk along a street, but some friend will come up and inflict a narration, limited entirely to his own view of a case in which he is interested or aggrieved, practically ignoring that there can and must be another way of stating it. And so great is the complaisance of mankind, that no one thinks of intimating any necessity for consulting another authority before giving judgment. Here the vicious habit of thoughtless pronouncing is doubly bad, as it involves also a kind of flattery.

There are some novel doctrines and theories, which seem doomed to meet with prejudice and opposition, but which yet must have some vitality about them, seeing that they survive so much ill-treatment. It is curious to observe how little regard to the rules of reasoning is usually felt to be necessary in opposing these theories—how mere pronouncing comes to stand in their case in the stead of evidence and argument. Although they may have been brought forward as mere forms of possible truth—ideal points round which to rally the scattered forces of investigation—and only advanced as far as facts would go, and no further—you will find them denounced as visions, tending to the breach of the philosophic peace; while, on the other hand, those who oppose them, albeit on no sort of ground but a mere pronouncement of contrary opinion, obtain all the credit due to the genuine philosopher. Abstractly, it would be generally admitted that any doctrine for which a certain amount of evidence is shewn, can only be overthrown by a superior force of evidence on the other side. But practically this is of no avail. Doubt and denial are so important to philosophy, and confer such an air of superior wisdom, that merely to doubt and deny will be pretty sure to carry both the educated and the uneducated vulgar. To get a high character in that position is of course very easy. Little more than pronouncing is required. As to the respective positions of the affirmer and denier in some future time, when truth has attained the power of asserting her reign against prejudice, that is another thing.

To return to the general question—If any one be impressed by our remarks with a sense of the absurdity of pronouncing without knowledge and reflection, let him endeavour to avoid it, and he will confer a sensible benefit on society. When next he is in company, and a subject occurs to tempt him into an expression of opinion, let him pause a moment, and say to himself: 'Now, do I know anything about it—or if I know something, do I know enough—to enable me to speak without fear of being contradicted? Have I ever given it any serious reflection? Am I sure that I have an opinion about it at all? Am I sure that I entertain no prejudice on the point?' Were every one of us children of British freedom to take these precautions, there would be more power amongst us to pronounce wisely. There would be a more vigorous and healthful public opinion, and the amenity, as well as instructiveness of private society would be much increased.

COOLING THE AIR OF ROOMS IN HOT CLIMATES.

In our last number, allusion was made to a process for cooling the air of apartments in hot climates, with a view to health and comfort. The intolerable heat of the climate in India, during certain hours of the day, is well known to be the cause of much bad health among European settlers. By way of rendering the air at all endurable, the plan of agitating it with punkahs, hung to the roofs of apartments, the punkahs being moved by servants in attendance for the purpose, is adopted. Another plan of communicating a sensation of coolness, is to hang wet mats in the open windows. But by neither of these expedients is the end in view satisfactorily gained. Both are nothing else than make-shifts.

The new process of cooling now to be described, is founded on a scientific principle, certain and satisfactory in its operation, provided it be reduced to practice in a simple manner. The discoverer is Professor Piazzi Smyth, who has presented a minute account of it in a paper in the *Practical Mechanic's Journal* for October 1850, and also separately in a pamphlet. We invite public attention to this curious but simple invention,

of which we shall proceed to present a few principles from the pamphlet just referred to.

Mr Smyth first speaks of the uselessness of the punkah, and the danger of the wet mats. 'The wet mats in the windows for the wind to blow through, cannot be employed but when the air is dry as well as hot, and even then are most unhealthy, for although the air may feel dry to the skin, there is generally far more moisture in it than in our own climate; but the height of the temperature increasing the capacity of the air for moisture, makes that air at 80 degrees feel very dry, which at 40 degrees would be very damp. Now, one of the reasons of the lassitude felt in warm climates is, that the air expanding with the heat, while the lungs remain of the same capacity, they must take in a smaller quantity by *weight*, though the same by *measure*, of oxygen, the supporter of life; but if, in addition to the air being rarefied, it be also still further distended by the vapour of water being mixed with it, it is evident that a certain number of cubic inches by measure, or the lungs full, will contain a less weight of oxygen than ever; so little, indeed, that life can barely be supported; and we need not wonder at persons lying down almost powerless in the hot and damp atmosphere, and gasping for breath. Hence we see that any method of cooling the air for Indians, instead of adding moisture, should rather take it out of the air, so as to make oxygen predominate as much as possible in the combined draught of oxygen, azote, and a certain quantity of the vapour of water, which will always be present; and hardly any plan could be more pernicious than the favourite though dreaded one by those who have watched its results—of the wet mats. Cold air—that is, air in which the thermometer actually stands at a low reading—by reason of its density, gives us oxygen, the food of the lungs, in a compressed and concentrated form; and men can accordingly do much work upon it. But air which is merely cold to the feelings—air in which the thermometer stands high, but which merely gives us one of the external sensations of coolness—on being made by a punkah, or any other mere blowing machine, to move rapidly over our skin—or on being charged with watery vapour, or on being contrasted with previous excessive heat—such air must, nevertheless, be rarefied to the full extent indicated by the mercurial thermometer, and give us, therefore, our supply of vital oxygen in a very diluted form, and of a meagre, unsupporting, and unsatisfying consistence. . . . The *sine quâ non*, therefore, for healthy and robust life in tropical countries, is air cold and dry—cold to the thermometer and dry to the hygrometer; or, in other words, dense, and containing little else than the necessary oxygen and azote, and this supplied to a room, fresh and fresh, in a continual current.'

He next goes on to describe the principle of his new plan of cooling:—'The method by which I propose to accomplish this consummation, so devoutly to be desired, is chiefly by taking advantage of the well-known property of air to rise in temperature on compression, and to fall on expansion. If air of any temperature, high or low, be compressed with a certain force, the temperature will rise above what it was before, in a degree proportioned to the compression. If the air be allowed immediately to escape from under the pressure, it will recover its original temperature, because the fall in heat, on air expanding from a certain pressure, is equal to the rise on its being compressed to the same; but if, while the air is in its compressed state, it be robbed of its acquired heat of compression, and then be allowed to escape, it will issue at a temperature as much below the original one, as it rose above it on compression. Thus the air, being at 90 degrees, will rise, if compressed to a certain quantity, to 120 degrees; if it be kept in this compressed and confined state until all the extra 30 degrees of heat have been conveyed away by radiation and conduction, and the

air be then allowed to escape, it will be found, on issuing, to be of 60 degrees of temperature. If a cooler be formed by a pipe under water, and air be forced in under a given compression at one end, and be made to pass along to the other, it may thereby, if the cooler be sufficiently extensive, be robbed of all its heat of compression; and if the apparatus is so arranged, as it easily may be, that at every stroke of the pump forcing in air at one end of the pipe, an equivalent quantity of the cooled compressed air escape from under a loaded valve at the other, there will be an intermittent stream of cooled air produced thereby, of 60 degrees Fahrenheit, in an atmosphere of 90 degrees, which may be led away in a pipe to the room desired to be cooled.'

The only difficulty to be encountered consists in the erection and working of machinery. There can be little fear on this score. We have no doubt that any London engine-maker would hit off the whole scheme of an air-cooling machine in half an hour. What is wanted is a forcing-pump wrought by a one horse or two bullock-power. This being erected and wrought outside of a dwelling, the air will be forced into a convoluted of pipe passing through a tank of water, like the worm of a still, and will issue by a check-valve at every stroke of the piston into the apartments to be cooled. Properly arranged, and with a suitable supply of water trickling through the tank, air at 90 degrees will be reduced to 60 degrees or thereabouts, which is the temperature of ordinary sitting-rooms in England. What, it may be asked, will be the expense of such an apparatus for cooling the air of a dwelling-house? We are informed that it will not be greater than that usually paid for heating with fires in this country; and if so, the expense cannot be considered a serious obstacle to the use of the apparatus. In the case of barracks for soldiers, hospitals, and other public establishments, the process will prove of such important service, that the cost, even if greater than it is likely to be, should present no obstacle to its application.

THE CHURCH OF THE CUP OF COLD WATER.

ONE beautiful evening, in the year 1815, the parish priest of San Pietro, a village a few miles distant from Sevilla, returned much fatigued to his little cottage, where he found his aged housekeeper, the Señora Margarita, watching for him. Notwithstanding that one is well accustomed to the sight of poverty in Spain, it was impossible to help being struck by the utter destitution which appeared in the house of the good priest; the more so, as every imaginable contrivance had been resorted to, to hide the nakedness of the walls, and the shabbiness of the furniture. Margarita had prepared for her master's supper a rather small dish of *olla-podriga*, which consisted, to say the truth, of the remains of the dinner, seasoned and disguised with great skill, and with the addition of some sauce, and a name. As she placed the savoury dish upon the table, the priest said: 'We should thank God for this good supper, Margarita; this olla-podriga makes one's mouth water. My friend, you ought to be grateful for finding so good a supper at the house of your host!' At the word host, Margarita raised her eyes, and saw a stranger, who had followed her master. Her countenance changed, and she looked annoyed. She glanced indignantly first at the unknown, and then at the priest, who, looking down, said in a low voice, and with the timidity of a child: 'What is enough for two, is always enough for three; and surely you would not wish that I should allow a Christian to die of hunger? He has not tasted food for two days.'

'A Christian! He is more like a brigand!' and Margarita left the room murmuring loudly enough to be heard.

Meanwhile, the unwelcome guest had remained standing at the door. He was a man of great height, half-dressed in rags, and covered with mud; while his black hair, piercing eyes, and carbine, gave him an appearance which, though hardly prepossessing, was certainly interesting. 'Must I go?' said he.

The priest replied with an emphatic gesture: 'Those whom I bring under my roof are never driven forth, and are never unwelcome. Put down your carbine. Let us say grace, and go to table.'

'I never leave my carbine, for, as the Castilian proverb says, "Two friends are one." My carbine is my best friend; and I always keep it beside me. Although you allow me to come into your house, and do not oblige me to leave it until I wish to do so, there are others who would think nothing of hauling me out, and, perhaps, with my feet foremost. Come—to your good health, mine host, and let us to supper.'

The priest possessed an extremely good appetite, but the voracity of the stranger soon obliged him to give up, for, not contented with eating, or rather devouring, nearly the whole of the olla-podriga, the guest finished a large loaf of bread, without leaving a crumb. While he ate, he kept continually looking round with an expression of inquietude: he started at the slightest sound; and once, when a violent gust of wind made the door bang, he sprang to his feet, and seized his carbine, with an air which shewed that, if necessary, he would sell his life dearly. Discovering the cause of the alarm, he reseated himself at table, and finished his repast.

'Now,' said he, 'I have one thing more to ask. I have been wounded, and for eight days my wound has not been dressed. Give me a few old rags, and you shall be no longer burdened with my presence.'

'I am in no haste for you to go,' replied the priest, whose guest, notwithstanding his constant watchfulness, had conversed very entertainingly. 'I know something of surgery, and will dress your wound.'

So saying, he took from a cupboard a case containing everything necessary, and proceeded to do as he had said. The stranger had bled profusely, a ball having passed through his thigh; and to have travelled in this condition, and while suffering, too, from want of food, shewed a strength which seemed hardly human.

'You cannot possibly continue your journey to-day,' said the host. 'You must pass the night here. A little rest will get up your strength, diminish the inflammation of your wound, and—'

'I must go to-day, and immediately,' interrupted the stranger. 'There are some who wait for me,' he added with a sigh—'and there are some, too, who follow me.' And the momentary look of softness passed from his features between the clauses of the sentence, and gave place to an expression almost of ferocity. 'Now, is it finished? That is well. See, I can walk as firmly as though I had never been wounded. Give me some bread; pay yourself for your hospitality with this piece of gold, and adieu.'

The priest put back the gold with displeasure. 'I am not an innkeeper,' said he; 'and I do not sell my hospitality.'

'As you will, but pardon me; and now, farewell, my kind host.'

So saying, he took the bread, which Margarita, at her master's command, very unwillingly gave him, and soon his tall figure disappeared among the thick foliage of a wood which surrounded the house, or rather the cabin. An hour had scarcely passed, when musket-shots were heard close by, and the unknown reappeared, deadly pale, and bleeding from a deep wound near the heart.

'Take these,' said he, giving some pieces of gold to his late host; 'they are for my children—near the stream—in the valley.'

He fell, and the next moment several police-officers rushed into the house. They hastily secured the unfortunate man, who attempted no resistance. The priest entreated to be allowed to dress his wound, which they permitted; but when this was done, they insisted on carrying him away immediately. They would not even procure a carriage; and when they were told of the danger of removing a man so severely wounded, they merely said: 'What does it matter? If he recovers, it will only be to receive sentence of death. He is the famous brigand, José!'

José thanked the intercessor with a look. He then asked for a little water, and when the priest brought it to him, he said in a faint voice: 'Remember!' The reply was merely a sign of intelligence. When they were gone, notwithstanding all Margarita could say as to the danger of going out at night, the priest crossed the wood, descended into the valley, and soon found, beside the body of a woman, who had doubtless been killed by a stray ball of the police, an infant, and a little boy of about four years old, who was trying in vain to awaken his mother. Imagine Margarita's amazement when the priest returned with two children in his arms.

'May all good saints defend us! What have you done, señor? We have barely enough to live upon, and you bring two children! I suppose I must beg from door to door, for you and for them. And, for mercy's sake, who are these children? The sons of that brigand, gipsy, thief, murderer, perhaps! I am sure they have never been baptised!' At this moment the infant began to cry. 'And pray, Señor Clérigo, how do you mean to feed that child? You know very well that we have no means of paying a nurse. We must spoon-feed it, and nice nights that will give me! It cannot be more than six months old, poor little creature,' she added, as her master placed it in her arms. 'Fortunately, I have a little milk here,' and forgetting her anger, she busied herself in putting some milk on the fire, and then sat down beside it to warm the infant, who seemed half-frozen. Her master watched her in silence, and when at last he saw her kiss its little cheek, he turned away with a quiet smile.

When at length the little one had been hushed into a gentle slumber, and when Margarita, with the assistance of her master's cloak, and some of her own clothes, had made a bed for the elder boy, and placed him in it, the good man told her how the children had been committed to his care, and the promise he had made, though not in words, to protect them.

'That is very right and good, no doubt,' said Margarita; 'I only want to know how we are all to live?' The priest opened his Bible, and read aloud:

'Whosoever shall give to drink unto one of these little ones a cup of cold water only in the name of a disciple, verily I say unto you, he shall in no wise lose his reward.'

'Amen!' said Margarita.

Twelve years passed by. The parish priest of San Pietro, who was now more than seventy years old, was sitting in the sunshine at his door. Near him, a boy of about twelve years old was reading aloud from the Bible, looking occasionally towards a tall, fine-looking young man, who was hard at work in a garden close by. Margarita, who was now become blind, sat and listened. Suddenly, the sound of wheels was heard, and the boy exclaimed: 'Oh! the beautiful carriage!' A splendid carriage approached rapidly, and stopped before the door. A richly-dressed servant approached, and asked for a cup of water for his master.

'Carlos,' said the priest to the younger boy, 'go, bring water to the gentleman; and add some wine, if he will accept it. Go quickly!' At this moment, the carriage-door opened, and a gentleman, apparently about fifty years old, alighted.

'Are these your nephews?' said he to the priest.

'They are more than that, señor; they are my children—the children of my adoption.'

'How is that?'

'I will tell you, señor; for I am old and poor, and know but little of the world, and am in much need of advice; for I know not what to do with these two children.' He related the story we have just told.

'And now, señor, what do you advise me to do?'

'Apply to one of the nobles of the court, who must assign you a pension of four thousand ducats.'

'I asked you for advice, señor, and not for jest.'

'And then, your church must be rebuilt. We will call it the Church of the Cup of Cold Water. Here is the plan. See, this is to be the vicarage; and here, divided by this paling'—

'What does this mean? What would you say? And, surely, I remember that voice, that face'—

'I am Don José della Ribeira; and twelve years ago, I was the brigand José. I escaped from prison; and—for the revolution made great changes—am now powerful. My children'—

He clasped them in his arms. And when at length he had embraced them a hundred times, with tears, and smiles, and broken sentences; and when all had in some degree recovered their composure, he took the hand of the priest and said: 'Well, father, will you not accept the Church of the Cup of Cold Water?' The old man, deeply affected, turned to Margarita, and repeated:

'Whosoever shall give to drink unto one of these little ones a cup of cold water only in the name of a disciple, verily I say unto you, he shall in no wise lose his reward.'

'Amen!' replied the aged woman, her voice tremulous from emotion.

A short time afterwards, Don José della Ribeira and his two sons were present at the consecration of the church of San-Pietro-del-Vaso-di-Aqua-Fria, one of the prettiest churches in the neighbourhood of Sevilla.

MUSIC-GRINDERS OF THE METROPOLIS.

PERHAPS the pleasantest of all the out-door accessories of a London life are the strains of fugitive music which one hears in the quiet by-streets or suburban highways—strains born of the skill of some of our wandering artists, who, with flute, violin, harp, or brazen tube of various shape and designation, make the brick-walls of the busy city responsive with the echoes of harmony. Many a time and oft have we lingered entranced by the witchery of some street Orpheus, forgetful, not merely of all the troubles of existence, but of existence itself, until the strajn had ceased, and silence aroused us to the matter-of-fact world of business. One blind fiddler, we know him well, with face upturned towards the sky, has stood a public benefactor any day these twenty years, and we know not how much longer, to receive the substantial homage of the music-loving million. But that he is scarcely old enough, he might have been the identical Oxford-Street Orpheus of Wordsworth:—

'His station is there; and he works on the crowd,
He aways them with harmony merry and loud;
He fills with his power all their hearts to the brim—
Was aught ever heard like his fiddle and him!'

Decidedly not—there is nothing to match it; and so thinks 'the one-pennied boy' who spares him his one penny, and deems it well bestowed. Then there are the harpers, with their smooth French-horn-breathing and piccolo-piping comrades, who at the soothing hour of twilight affect the tranquil and retired paved courts or snug enclosures far from the roar and rumble of chariot-wheels, where, clustered round with lads and

lasses released from the toils of the day, they dispense romance and sentiment, and harmonious cadences, in exchange for copper compliments and the well-merited applause of fit audiences, though few. Again, there are the valorous brass-bands of the young Germans, who blow such spirit-stirring appeals from their travel-worn and battered tubes—to say nothing of the thousand performers of solos and duets, who, wherever there is the chance of a moment's hearing, are ready to attempt their seductions upon our ears to the prejudice of our pockets. All these we must pass over with this brief mention upon the present occasion; our business being with their numerous antitheses and would-be rivals—the incarnate nuisances who fill the air with discordant and fragmentary mutilations and distortions of heaven-born melody, to the distraction of educated ears and the perversion of the popular taste.

'Music by handle,' as it has been facetiously termed, forms our present subject. This kind of harmony, which is not too often deserving of the name, still constitutes, notwithstanding the large amount of indispensible talent which derives its support from the gratuitous contributions of the public, by far the larger portion of the peripatetic minstrelsy of the metropolis. It would appear that these grinders of music, with some few exceptions which we shall notice as we proceed, are distinguished from their praiseworthy exemplars, the musicians, by one remarkable, and to them perhaps very comfortable characteristic. Like the exquisite Charles Lamb—if his curious confession was not a literary myth—they have ears, but no ear, though they would hardly be brought to acknowledge the fact so candidly as he did. They may be divided, so far as our observation goes, into the following classes:—1. Hand-organists; 2. Monkey-organists; 3. Handbarrow-organists; 4. Handcart-organists; 5. Horse-and-cart-organists; 6. Blindbird-organists; 7. Piano-grinders; 8. Flageolet-organists and pianists; 9. Hurdy-gurdy players.

1. The hand-organist is most frequently a Frenchman of the departments, nearly always a foreigner. If his instrument be good for anything, and he have a talent for forming a connection, he will be found to have his regular rounds, and may be met with any hour in the week at the same spot he occupied at that hour on the week previous. But a man so circumstanced is at the head of the vagabond profession, the major part of whom wander at their own sweet will wherever chance may guide. The hand-organ which they lug about varies in value from L.10 to L.150—at least, this last-named sum was the cost of a first-rate instrument thirty years ago, such as were borne about by the street-organists of Bath, Cheltenham, and the fashionable watering-places, and the grinders of the West End of London at that period, when musical talent was much less common than it is now. We have seen a contract for repairs to one of these instruments, including a new stop and new barrels, amounting to the liberal sum of L.75: it belonged to a man who had grown so impudent in prosperity, as to incur the penalty of seven years' banishment from the town in which he turned his handle, for the offence of thrashing a young nobleman, who stood between him and his auditors too near for his sense of dignity. Since the invention of the metal reed, however, which, under various modifications and combinations, supplies the sole utterance of the harmonicon, celestina, seraphina, eolophon, accordin, concertina, &c. &c. and which does away with the necessity for pipes, the street hand-organ has assumed a different and infinitely worse character. Some of them yet remain what the old Puritans called 'boxes of

whistles'—that is, they are all pipes; but many of them might with equal propriety be called 'boxes of Jews-harpa,' being all reeds, or rather vibrating metal tongues—and more still are of a mixed character, having pipes for the upper notes, and metal reeds for the bass. The effect is a succession of sudden hoarse brays as an accompaniment to a soft melody, suggesting the idea of a duet between Titania and Bottom. But this is far from the worst of it. The profession of hand-organist having of late years miserably declined, being in fact at present the next grade above mendicancy, the element of cheapness has, per force, been studied in the manufacture of the instrument. The barrels of some are so villainously pricked that the time is altogether broken, the ear is assailed with a minim in the place of a quaver, and *vice versa*—and occasionally, as a matter of convenience, a bar is left out, or even one is repeated, in utter disregard of suffering humanity. But what is worse still, these metal reeds, which are the most untunable things in the whole range of sound-producing material, are constantly, from contact with fog and moisture, getting out of order; and howl dolorously as they will in token of their ailments, their half-starved guardian, who will grind half an hour for a penny, cannot afford to medicate their pains, even if he is aware of them, which, judging from his placid composure during the most infamous combination of discords, is very much to be questioned.*

2. The monkey-organist is generally a native of Switzerland or the Tyrol. He carries a worn-out, doctored, and flannel-swathed instrument, under the weight of which, being but a youth, or very rarely an adult, he staggers slowly along, with outstretched back and bended knees. On the top of his old organ sits a monkey, or sometimes a marmoset, to whose queer face and queerer tricks, he trusts for compensating the defective quality of his music. He dresses his shivering brute in a red jacket and a cloth cap; and, when he can, he teaches him to grind the organ, to the music of which he will himself dance wearily. He wears an everlasting smile upon his countenance, indicative of humour, natural and not assumed for the occasion: and though he invariably unites the profession of a beggar with that of monkey-master and musician, he has evidently no faith in a melancholy face, and does not think it absolutely necessary to make you thoroughly miserable in order to excite your charity. He will leave his monkey grinding away on a door-step, and follow you with a grinning face for a hundred yards or more, singing in a kind of recitative: 'Date qualche cosa, signor! per amor di Dio, eccellenza, date qualche cosa!' If you comply with his request, his voluble thanks are too rapid for your comprehension; and if you refuse, he laughs merrily in your face as he turns away to rejoin his friend and coadjutor. He is a favourite subject with the young artists about town, especially if he is very good-looking, or, better still, excessively ugly; and he picks up many a shilling for sitting, standing, or sprawling on the ground, as a model in the studio. It sometimes happens that he has no organ—his monkey being his only stock in trade. When the monkey dies—and one sees by their melancholy comicalities, and cautious and painful grimaces, that the poor brutes are destined to a short time of it—he takes up with white mice, or, lacking these, constructs a dancing-doll, which, with the aid of a short

plank with an upright at one end, to which is attached a cord passing through the body of the doll, and fastened to his right leg, he keeps constantly on the jig, to the music of a tuneless tin-whistle, bought for a penny, and a very primitive parchment tabor, manufactured by himself. These shifts he resorts to in the hope of retaining his independence and personal freedom—failing to succeed in which, he is driven, as a last resource, to the comfortless drudgery of piano-grinding, which we shall have to notice in its turn.

3. The handbarrow-organist is not uncommonly some lazy Irishman, if he be not a sickly Savoyard, who has mounted his organ upon a handbarrow of light and somewhat peculiar construction, for the sake of facilitating the task of locomotion. From the nature of his equipage, he is not given to grinding so perpetually as his heavily-burdened brethren. He cannot of course grind, as they occasionally do, as he travels along, so he pursues a different system of tactics. He walks leisurely along the quiet ways, turning his eyes constantly to the right and left, on the look-out for a promising opening. The sight of a group of children at a parlour-window brings him into your front garden, where he establishes his instrument with all the deliberation of a proprietor of the premises. He is pretty sure to begin his performance in the middle of a tune, with a hiccupping kind of sound, as though the pipes were gasping for breath. He puts a sudden period to his questionable harmony the very instant he gets his penny, having a notion, which is tolerably correct, that you pay him for his silence and not for his sounds. In spite of his discordant gurglings and squealings, he is welcomed by the nursery-maids and their infant tribes of little sturdy rogues in petticoats, who flock eagerly round him, and purchase the luxury of a half-penny grind, which they perform *con amore*, seated on the top of his machine. If, when your front garden is thus invaded, you insist upon his decamping without a fee, he shews his estimate of the peace and quietness you desiderate by his unwillingness to retire, which, however, he at length consents to do, though not without a muttered remonstrance, delivered with the air of an injured man. He generally contrives to house himself as night draws on in some dingy taproom, appertaining to the lowest class of Tom-and-Jerry shops, where, for a few coppers and 'a few beer,' he will ring all the changes on his instrument twenty times over, until he and his admiring auditors are ejected at midnight by the police-fearing landlord.

4. The handcart-organists are a race of a very different and more enterprising character, and of much more lofty and varied pretensions. They generally travel in firms of two, three, or even four partners, drawing the cart by turns. Their equipage consists of an organ of very complicated construction, containing, besides a deal of very marvellous machinery within its entrails, a collection of bells, drums, triangles, gongs, and cymbals, in addition to the usual quantity of pipes and metal-reeds that go to make up the travelling organ. The music they play is of a species which it is not very easy to describe, as it is not once in a hundred times that a stranger can detect the melody through the clash and clangor of the gross amount of brass, steel, and bell-metal put in vibration by the machinery. This, however, is of very little consequence, as it is not the music in particular which forms the principal attraction: if it serve to call a crowd together, that is sufficient for their purpose; and it is for this reason, we imagine, that the effect of the whole is contrived to resemble, as it very closely does, the hum and jangle of Greenwich Fair when heard of an Easter Monday from the summit of the Observatory Hill. No, the main attraction is essentially dramatic. In front of the great chest of heterogeneous sounds there is a stage about five or six feet in width, four in height, and perhaps eighteen inches or two feet in depth. Upon

* Among some of the continental nations, Justice, though blind, is not supposed to be deaf; she has, on the contrary, a musical ear, and compels the various grinders of harmony to keep their instruments in tune, under the penalty of a heavy fine. In some of the German cities, the police have summary jurisdiction in offences musical, and are empowered to demand a certificate, with which every grinder is bound to be furnished, shewing the date of the last tuning of his instrument. If he perpetrate false harmony, and his certificate be run out, he is mulcted in the fine. Such a by-law would be a real bonus in London.

this are a variety of figures, about fourteen inches long, gorgeously arrayed in crimson, purple, emerald-green, blue, and orange draperies, and loaded with gold and tinsel, and sparkling stones and spangles, all doubled in splendour by the reflection of a mirror in the background. The figures, set in motion by the same machinery which grinds the incomprehensible overture, perform a drama equally incomprehensible. At the left-hand corner is Daniel in the lion's den, the lion opening his mouth in six-eight time, and an angel with outspread wings, but securely transfixed through the loins by a revolving brass pivot, shutting it again to the same lively movement. To the right of Daniel is the Grand Turk, seated in his divan, and brandishing a dagger over a prostrate slave, who only ventures to rise when the dagger is withdrawn. Next to him is Nebuchadnezzar on all fours, eating painted grass, with a huge gold crown on his head, which he bobs for a bite every other bar. In the right-hand corner is a sort of cavern, the abode of some supernatural and mysterious being of the fiend or vampire school, who gives an occasional fitful start, and turns an ominous-looking green glass-eye out upon the spectators. All these are in the background. In the front of the stage stands Napoleon, wearing a long sword and cocked hat, and the conventional gray smalls—his hand of course stuck in his breast. At his right are Tippoo Saib and his sons, and at his left, Queen Victoria and Prince Albert. After a score or so of bars, the measure of the music suddenly alters—Daniel's guardian angel flies off—the prophet and the lion lie down to sleep together—the Grand Turk sinks into the arms of the death-doomed slave. Nebuchadnezzar falls prostrate on the ground, and the fiend in the gloomy cavern whips suddenly round and glares with his green eye, as if watching for a spring upon the front row of actors, who have now taken up their cue and commenced their performance. Napoleon, Tippoo Saib, and Queen Victoria, dance a three-handed reel, to the admiration of Prince Albert and a group of lords and ladies in waiting, who nod their heads approvingly—when *br'r'r! crack! bang!* at a tremendous crash of gongs and grumbling of bass-notes, the fiend in the corner rushes forth from his lair with a portentous howl. Away, neck or nothing, flies Napoleon, and Tippoo scampers after him, followed by the terrified attendants; but lo! at the precise nick of time, Queen Victoria draws a long sword from beneath her stays, while up jumps the devouring beast from the den of the prophet, and like a true British lion—as he doubtless was all the while—flies at the throat of the fiend, straight as an arrow to its mark. Then follows a roar of applause from the discriminating spectators, amidst which the curtain falls, and, with an extra flourish of music, the collection of copper coin commences. This is always a favourite spectacle with the multitude, who never bother themselves about such trifles as anachronisms and unities; and the only difficulty the managers have to overcome in order to insure a remunerative exhibition, is that of finding a quiet locality, which shall yet be sufficiently frequented to insure them an audience. There are equipages of this description of very various pretensions and perfection, but they all combine the allurements of music and the drama in a greater or less degree.

5. The horse-and-cart-organists are a race of enterprising speculators, who, relying upon the popular penchant for music, have undertaken to supply the demand by wholesale. It is impossible by mere description to impart an adequate idea of the truly appalling and tremendous character of their performances. Their machines are some of them vast structures, which, mounted upon stout wheels, and drawn by a couple of servicable horses, might be mistaken for wild-beast vans. They are crammed choke-full with every known mechanical contrivance for the production of ear-stunning noises. Wherever they burst forth into

utterance, the whole parish is instantly admonished of their whereabouts, and, with the natural instinct of John Bull for a row—no matter how it originates—forth rushes the crowd to enjoy the dissonance. The piercing notes of a score of shrill fifes, the squall of as many clarions, the hoarse bray of a legion of tin trumpets, the angry and fitful snort of a brigade of rugged bassoons, the unintermitting rattle of a dozen or more deafening drums, the clang of bells firing in peals, the boom of gongs, with the sepulchral roar of some unknown contrivance for bass, so deep that you might almost count the vibrations of each note—these are a few of the components of the horse-and-cart-organ, the sum-total of which it is impossible to add up. Compared to the vicinity of a first-rater in full blow, the inside of a menagerie at feeding-time would be a paradise of tranquillity and repose. The rattle and rumble of carts and carriages, which drive the professors and possessors of milder music to the side-streets and suburbs, sink into insignificance when these cataracts of uproar begin to peal forth; and their owners would have no occasion to seek an appropriate spot for their volcanic eruptions, were it not that the police, watchful against accident, have warned them from the principal thoroughfares, where serious consequences have already ensued through the panic occasioned to horses from the continuous explosion of such unwonted sounds. In fact, an honourable member of the Commons' House of Parliament made a motion in the House, towards the close of the last session, for the immediate prohibition of these monster nuisances, and quoted several cases of alarm and danger to life of which they had been the originating cause. These formidable erections are for the most part the property and handiwork of the men who travel with them, and who must levy a pretty heavy contribution on the public to defray their expenses. They perform entire overtures and long concerted pieces, being furnished with spiral barrels, and might probably produce a tolerable effect at the distance of a mile or so—at least we never heard one yet without incontinently wishing it a mile off. By a piece of particular ill-fortune, we came one day upon one undergoing the ceremony of tuning, on a piece of waste-ground at the back of Coldbath Prison. The deplorable wail of those tortured pipes and reeds, and the short savage grunt of the bass mystery, haunted us, a perpetual day-and-night-mare, for a month. We could not help noticing, however, that the jauntily-dressed fellow, whose fingers were covered with showy rings, and ears hung with long drops, who performed the operation, managed it with consummate skill, and with an ear for that sort of music most marvellously discriminating.

6. Blind bird-organists. Though most blind persons either naturally possess or soon acquire an ear for music, there are yet numbers who, from the want of it or from some other cause, never make any proficiency as performers on an instrument. Blindness, too, is often accompanied with some other disability, which disqualifies its victims for learning such trades as they might otherwise be taught. Hence many, rather than remain in the workhouse, take to grinding music in the streets. Here we are struck with one remarkable fact: the Irishman, the Frenchman, the Italian, or the Savoyard, at least so soon as he is a man, and able to lug it about, is provided with an instrument with which he can make a noise in the world, and prefer his clamorous claim for a recompense; while the poor blind Englishman has nothing but a diminutive box of dilapidated whistles, which you may pass fifty times without hearing it, let him grind as hard as he will. It is generally nothing more than an old worn-out bird-organ, in all likelihood charitably bestowed by some compassionate Poll Sweedlepipes, who has already used it up in the education of his bull-finches. The reason, we opine, must be that the major part, if not the whole, of the peripatetic instruments of the metropolis are the

property of speculators, who let them out on hire, and that the blind man, not being considered an eligible customer, is precluded from the advantage of their use. However this may be, the poor blind grinder is almost invariably found furnished as we have described him, jammed up in some cranny or corner in a third-rate locality, where, having opened or taken off the top of his box, that the curious spectator may behold the mystery of his too quiet music—the revolving barrel, the sobbing bellows, and the twelve leaden and ten wooden pipes—he turns his monotonous handle throughout the live-long day, in the all but vain appeal for the commiseration of his fellows. This is really a melancholy spectacle, and one which we would gladly miss altogether in our casual rounds.

7. The piano-grinders are by far the most numerous of the handle-turning fraternity. The instrument they carry about with them is familiar to the dwellers in most of the towns in England. It is a miniature cabinet-piano, without the keys or finger-board, and is played by similar mechanical means to that which gives utterance to the hand-organ; but of course it requires no bellows. There is one thing to be said in favour of these instruments—they do not make much noise, and consequently are no very great nuisance individually. The worst thing against them is the fact, that they are never in tune, and therefore never worth the hearing. After grinding for twelve or fourteen hours a day for four or five years, they become perfect abominations; and luckless is the fate of the poor little stranger condemned to perpetual companionship with a villainous machine, whose every tone is the cause of offence to those whose charity he must awaken into exercise, or go without a meal. These instruments are known to be the property of certain extensive proprietors in the city, some of whom have hundreds of them grinding daily in every quarter of the town. Some few are let out on hire—the best at a shilling a day; the old and worn-out ones as low as two or three pence; but the great majority of them are ground by young Italians shipped to this country for the especial purpose by the owners of the instruments. These descendants of the ancient Romans figure in Britain in a very different plight from that of their renowned ancestors. They may be encountered in troops sallying forth from the filthy purlieus of Leather Lane, at about nine or ten in the morning, each with his awkward burden strapped to his back, and supporting his steps with a stout staff, which also serves to support the instrument when playing. Each one has his appointed beat, and he is bound to bring home a certain prescribed sum to entitle him to a share in the hot supper prepared for the evening meal. We have more than once, when startled by the sound of the everlasting piano within an hour of midnight, questioned the belated grinder, and invariably received for answer, that he had not yet been able to collect the sum required of him. Still there can be no doubt that some of them contrive to save money; inasmuch as we occasionally see an active fellow set up on his own account, and furnished with an instrument immensely superior to those of his less prosperous compatriots. So great is the number of these wandering Italian pianists, that their condition has attracted the attention of their more wealthy countrymen, who, in conjunction with a party of benevolent English gentlemen, have set on foot an association for the express purpose of imparting instruction to poor Italians of all grades, of whom the vagabond musicians form the largest section.

It is easy to recognise the rule adopted in the distribution of the instruments among the grinders: the stoutest fellow, or he who can take the best care of it, gets the best piano; while the shattered and rickety machine goes to the urchin of ten or twelve, who can scarcely drag it a hundred yards without resting. It is to be supposed that the instruments are all rated according to their quality. There is at this moment,

wandering about the streets of London a singular and pitiable object, whose wretched lot must be known to hundreds of thousands, and who affords in his own person good evidence of the strictness of the rule above alluded to, as well as of the rigour with which the trade is carried on. We refer to a ragged, shirtless, and harmlessly insane Italian lad, who, under the guardianship of one of the piano-mongers, is driven forth daily into the streets, carrying a blackened and gutted old piano-case, in which two strings only of the original scale remain unbroken. The poor unwashed innocent transports himself as quickly as possible to the genteel neighbourhood he can find, and with all the enthusiasm of a Jullien, commences his monotonous grind. Three turns of the handle, and the all but defunct instrument ejaculates 'tink;' six more inaudible turns, and then the responding string answers 'tank.' 'Tink—tank' is the sum-total of his performance, to any defects in which he is as insensible as a blind man is to colour. As a matter of course, he gets ill-treated, mobbed, pushed about, and upset by the blackguard scamps about town; and were it not for the police, who have rescued him times without number from the hands of his persecutors, he would long ere now have been reduced to as complete a ruin as his instrument. In one respect, he is indeed already worse off than the dilapidated piano: he is dumb as well as silly, and can only utter one sound—a cry of alarm of singular intensity; this cry forms the climax of pleasure to the wretches who dog his steps, and this, unmoved by his silent tears and woful looks, they goad him to shriek forth for their express gratification. We have stumbled upon him at near eleven at night, grinding away with all his might in a storm of wind and rain, perfectly unconscious of either, and evidently delighted at his unusual freedom from interruption.

8. Flageolet-organists and pianists. It is a pleasure to award praise where praise is due, and it may be accorded to this class of grinders, who are, to our minds, the elite of the profession. We stated above that some of the piano-grinders contrive, notwithstanding their difficult position, to save money and set up for themselves. It is inevitable that the faculty of music must be innate with some of these wandering pianists, and it is but natural that these should succeed the best, and be the first to improve their condition. The instrument which combines a flageolet-stop with a piano is generally found in the possession of young fellows who, by dint of a persevering and savage economy, have saved sufficient funds to procure it. Indeed, in common hands, it would be of less use than the commonest instrument, because it requires frequent—more than daily—tuning, and would therefore be of no advantage to a man with no ear. Unless the strings were in strict unison with the pipes, the discordance would be unbearable, and as this in the open air can hardly be the case for many hours together, they have to be rectified many times in the course of a week. As might be reasonably supposed, these instruments are comparatively few. When set to slow melodies, the flageolet taking the air, and the piano a well-arranged accompaniment, the effect is really charming, and, there is little reason to doubt, is found as profitable to the producer as it is pleasing to the hearer. They are to be met with chiefly at the west end of the town, and on summer evenings beneath the lawyers' windows in the neighbourhood of some of the Inns of Court.

9. The hurdy-gurdy player. We have placed this genius last, because, though essentially a most horrid grinder, he, too, is in some sort a performer. In London, there may be said to be two classes of them—little hopping, skipping, jumping, reeling Savoyard or Swiss urchins, who dance and sing, and grind and play, doing, like *Cæsar*, four things at once, and whom you expect every moment to see rolling on the pavement, but who continue, like so many kittens, to pitch on

their feet at last, notwithstanding all their antics—and men with fallow complexions, large dark eyes, and silver ear-rings, who stand erect and tranquil, and confer a dignity, not to say a grace, even upon the performance of the hurdy-gurdy. The boys for the most part do not play any regular tune, having but few keys to their instruments, often not even a complete octave. The better instruments of the adult performers have a scale of an octave and a half, and sometimes two octaves, and they perform melodies and even harmonies with something like precision, and with an effect which, to give it its due praise, supplies a very tolerable caricature of the Scotch bagpipes. These gentry are not much in favour either with the genuine lovers of music or the lovers of quiet, and they know the fact perfectly well. They hang about the crowded haunts of the common people, and find their harvest in a vulgar jollification, or an extempore 'hop' at the door of a suburban public-house on a summer night. There are a few old-women performers on this hybrid machine, one of whom is familiar to the public through the dissemination of her *vera effigies* in a contemporary print.

The above are all the grinders which observation has enabled us to identify as capable of classification. The reader may, if he likes, suppose them to be the metropolitan representatives of the nine Muses—and that, in fact, in some sort they are, seeing that they are the embodiments to a certain extent of the musical tastes of a section at least of the inhabitants of London; though, if we are asked which is Melpomene? which is Thalia? &c. &c. we must adopt the reply of the showman to the child who asked which was the lion and which was the dog, and received for answer: 'Which-ever you like, my little dear.'

With respect to all these grinders, one thing is remarkable: they are all, with the exception of a small savour of Irishmen, foreigners. Scarcely one Englishman, not one Scot, will be found among the whole tribe; and this fact is as welcome to us as it is singular, because it speaks volumes in favour of the national propensity, of which we have reason to be proud, to be ever doing something, producing something, applying labour to its legitimate purpose, and not turning another man's handle to grind the wind. Yet there is, alas! a scattered and characteristic tribe of vagabond English music-grinders, and to these we must turn a moment's attention ere we finally close the list. We must call them, for we know no more appropriate name, cripple-grinders. It is impossible to carry one's explorations very far through the various districts of London without coming upon one or more samples of this unfortunate tribe. Commerce maims and mutilates her victims as effectually as war, though not in equal numbers; and men and lads without arms, or without legs, or without either, and men doubled up and distorted, and blasted blind and hideous with gunpowder, who have yet had the misfortune to escape death, are left without limbs or eyesight, often with shattered intellects, to fight the battle of life, at fearful odds. Had they been reduced to a like miserable condition while engaged in killing their fellow-creatures on the field of battle or on the deck of carnage, a grateful country would have housed them in a palace, and abundantly supplied their every want; but they were merely employed in procuring the necessaries of life for their fellows in the mine or the factory, and as nobody owes them any gratitude for that, they must do what they can. And behold what they do: they descend, being fit for nothing else, to the level of the foreign music-grinder, and, mounted on a kind of bed-carriage, are drawn about the streets of London by their wives or children; being furnished with a blatant hand-organ of last century's manufacture, whose ear-torturing growl draws the attention of the public to their woful plight, they extort that charity which

would else fail to find them out. If there be something gratifying in the fact, that this is the only class of Britons who follow such an inglorious profession, there is nothing very flattering in the consideration, that even these are compelled to it by inexorable necessity.

A VOICE FROM THE DIGGINGS.

THE voices that have come from the diggings in California and Australia have hitherto been so loud and so many, that they have served only to confuse. We have the image before our fancy of a vast crowd of human beings hastening over seas and deserts towards certain geographical points, where they meet, struggle, fix. We see them picking up lumps of gold from the surface, or digging them out of the earth, or collecting the glittering dust by sifting and washing; and then we hear of vast torrents of the precious metal finding their way into Europe, threatening to swamp us all with absolute wealth, and confound and travesty the whole monetary transactions of the world. What we don't see, is the gold itself. We should like, if it were only out of curiosity, to feel a handful of it in our pocket: but we grope in vain. A sovereign costs twenty shillings, as before; and twenty shillings are as hard to come at as ever. Nevertheless, we believe in the unseen presence of that slave-genius, who lends himself, with a sickly smile, to the service of mankind, and buys when we think he is sold! We have faith in bills of lading, and accept without question any amount that is reported to lie dormant in the reservoir of the Bank of England: only we wonder in private whether the importations of the precious metal are likely to increase permanently in greater proportion than the population in this quarter of the globe, and the spread of taste, comfort, and luxury, calling every day new arts into existence, perfecting old ones, and distributing wealth throughout the constantly widening circle of talent and industry.

But our present business is with the diggings and the diggers. We have often wished we could interrogate one of those unquiet spirits in the manner of Macbeth—'What is't ye do?' How do you manage? By what signs do you know a locality that is likely to repay your pains? What are your instruments, your machinery? What do you conceive to be the prospects of your singular trade? And, in fact, our curiosity is at this moment to a certain extent gratified: a Voice has been wafted across the ocean to our private ear, and, undisturbed by the thousand other tongues of the diggings, we can listen to an account, distinct so far as it goes, of the whole process of gold-hunting. The voice emanates from Mr S. Rutter, of Sydney, whose experience has lain both in the Californian and Australian mines, and we propose putting together, in as intelligible a way as we can, the rough hints with which we have been favoured.

Mr Rutter, on the 24th of May last, left Sydney for the Ophir diggings, with a party, including himself, of four individuals. A sleeping partner remained behind, whose duty it was to furnish the means of conveyance for the first trip; but the four travellers entered with each other into a more precise agreement, the chief articles of which we give, as being common in such adventures:—

- I. We solemnly agree to stand by each other in all circumstances.
- II. Each man is to come provided with firearms.
- III. The capital is to be contributed equally, or credit given, as may be agreed to by the majority.
- IV. The profit or loss to be equally divided.
- V. In the event of death or disablement occurring to any of the party, his share of the stock and profits is to be immediately handed over to his friends.

On this paction being signed, the party set forth,

provided with L.100 worth of goods, a cart and a team of horses, and reached Paramatta, a distance of eighteen miles, the first night, although they were obliged to send back one of the horses, which had proved to be useless. Here Mr Rutter slept in a bed for the last time during four months; and the next day, having purchased another horse, and sold some of their goods to lighten the wagon, they set forth again towards evening. The road was nothing more than a dray-track, to which the horses were unequal; and after proceeding a few miles, they were detained at the village of Prospect for a week, till one of the partners had returned to Sydney, and brought back a pair of bush-horses and a new cart. As they proceeded the next day, they found the track over which they travelled become more and more populous; till, on crossing the Macquarrie, they encamped in the midst of thirteen teams of cattle and their thirteen companies, all bound upon the same errand as themselves.

On the 12th of June, in the dusk of the evening, they reached the summit of a hill overlooking their destination. The Summerhill Creek lay before them, with the camp-fires of fifty or sixty huts; and as they descended into the midst, the inhabitants of this village of the desert were returning from work with laughter and rude merriment. After pitching their camp, and taking some refreshment, they proceeded anxiously to inquire the news; and that night they turned in with no very bright anticipations, after learning that the creek was high and goods low, the weather alternating between rain and frost, the mines overcrowded, and superfluous hands deserting them fast. They struggled for awhile against these evil auguries; they even contrived, with great labour, to pick up an ounce or two of gold; but at length, losing heart, the party broke up on the 28d, and all went home but our adventurer.

His geological and mechanical knowledge enabled him to obtain a partnership with another band of gold-hunters then at work; and after spending some days in prospecting on account of the new concern, he found 'a chink he liked the look of,' which appeared to have been partially worked. Licences were accordingly taken out, the commissioner being on the spot, and forty-five feet of frontage to the creek were marked off. As soon as the river became a little lower, they began in earnest to dig a race for turning the course of the water. Their pump was made and fixed ready to drain; a dam was emptied; six ounces of gold were obtained as an earnest of what they might expect; and then it began to rain, and the creek to roar, and the whole of their machinery was swept away.

Here was a new mishap: but these things will happen in the diggings; and so our adventurers, agreeing to pay the commissioner a monthly licence for their ground, intending to return in the dry weather to work it, removed bag and baggage to another part of the river. Here they dug away, but it appears with no tempting success; and they took care to return to the commissioner in time, as they thought, to implement their monthly bargain. On tendering the money for their licence, however, they discovered that they were just half an hour too late, and that the functionary had disposed of their forty-five feet to another bidder. What to do now? They fell in with a man, an old friend of Mr Rutter, just setting off on a journey of sixty-two miles to the north, where he told them a piece of gold had been found weighing 106 lbs. This invaluable man they instantly took into partnership, and purchasing fresh horses, they struck their camp, and followed their new companion across the country, in search of a place called the Devil's Hole, near the World's End. It is no wonder they lost their way. As there was no such thing as a road, they were obliged to transport their goods on the horses' backs; and the interesting nature of their journey may be guessed at from the fact, that they had to cross a

creek with steep banks sixteen times in the course of five miles.

They at length reached the Louisa Diggings, near those quartz-ridges where, in fact, a 106 lb. lump of gold had been found. They encamped in the dark; and getting up betimes the next morning, looked eagerly out on this land of promise. It was a dull, dreary morning, and a heavy continuous rain plashed upon the earth. About 200 persons were taking the air in this watery atmosphere, their dress and movements corresponding well with the aspect of the hour. Some were covered with an old sack, some with a blanket, some with a dripping cloak, but all glided slowly about in the rain, with a stick in their hands, and their eyes fixed upon the ground. These phantoms were gold-hunters; and the silent company was immediately joined by our adventurers, who glided and poked like the rest. The ground was new, and during two days gold was obtained in this way, from a particle the size of a pin's head to a lump of nearly an ounce. When the surface was exhausted, digging commenced; but the soil was too tough for the common cradle, and although rich in gold, it would not repay the trouble of washing. Upon this, the company broke up, each pursuing his own way; and our adventurer and another agreed to go down the country together to Maitland, prospecting on the way.

The place where the large mass of gold was found is an intersection between two quartz-ridges, rising from a high table-land in the midst of a congeries of mountains, offshoots from the range that extends from Wilson's Point, on the south, to Cape York, on the north. The clay soil covers many acres below and around the ridges, and wherever it was prospected by our adventurer, gold was found. On the 12th of September, he reached Maitland; and here he found a letter awaiting him, which determined him to choose a new hunting-ground. Some years before, it seems, a man he knew, who was at that time a shepherd in the Wellington District, while crossing the country on his master's business, lost his way in the gullies, and did not find it again for two days. While sitting down, in his dilemma, on a quartz-rock, he observed something glittering beside him, and breaking off with his tomahawk a piece of the stone, he carried it home with him as a curiosity. At home it lay for years, till the reported discoveries of gold induced him to offer it for sale to a goldsmith in Sydney. The result was, that he connected himself with a party of adventurers, and they all set forth for the place where he had rested among the gullies. His companions proved treacherous; and when they had come sufficiently near to be able, as they thought, to find the spot without his assistance, they turned him adrift. They sought the golden rock for three days—but in vain; and he went back to Sydney, to invite Mr Rutter to accompany him. Here ends our narrative for the present; and a most instructive one it is. The search for gold, our informant tells us plainly, is a mere lottery, its results depending almost wholly upon chance. Plenty as the metal is, it frequently costs twenty shillings the sovereign's worth; and, in short, we are at that point of transition when the mania is dying away, and the science has not begun. When capital and skill are brought to bear upon the process of mining in Australia, it will become a regular, though by no means a miraculously profitable business; and even at present, steady labouring-men may spread themselves over thousands of miles of the auriferous creeks, if they will be satisfied with a profit of seven or eight shillings a day.

According to his experience, the place to look for gold is in the neighbourhood of distinct traces of volcanic action, or in small streams coming direct from hills of volcanic formation, or rivers fed by these streams. An abundance of quartz (commonly called

spar) is universally reckoned an indication of the presence of gold; and if trap-rock is found cropping up amid this quartz, and perforated with streaks of it, so much the better. Sometimes the solid quartz itself is pounded, and gold extracted by the aid of quicksilver. When the gold is found in rivers, or on their banks, prediction is vain: nothing will do but the actual trial by the wash-pan. But where there is a bar or sand-bank, the richest deposit will always be on the side of the bank presented to the descending stream. The metal in such digging is almost invariably found in small spangles, that appear to have been granular particles crushed or rolled flat by some enormous pressure. In California, these spangles were the beginning of the gold-finding. When the streams and their banks were well searched, the crowds of adventurers tried, in desperation, what they could do by digging deep holes in the plains; and there the metal was found in such different forms as to indicate quite a different process of deposition. Some of these holes were productive—although it was severe labour to dig fifteen or eighteen feet through a hard soil merely as an experiment; and in the course of time the plains were covered with tents. The influx of adventurers continued; and the old diggers, dissatisfied with gains that seemed to the new prodigious, retired further and further back, and began to grope in the terraces on the sides of volcanic hills, and among the detritus of extinct craters. Here the harvest was rich, and as the crowning effort of the gold-passion, unassisted by machinery, they actually in some cases cut away the sides of the hills! 'My own impression is,' concludes our informant on this subject, 'that, both in California and Australia, the chances of individual enterprise, and even of small companies, are decreasing rapidly; but that when the mines so wrought have ceased to pay, capital and machinery, directed by science, will receive profitable employment for ages to come.'

The wash-pan we have mentioned may be of tin, if not required to be used with quicksilver, otherwise of copper or wood; but of whatever material made, it should be some 15 inches in diameter at the top, 10 or 11 at the bottom, and 5, or 5½ inches deep. The manner of using this is learned only by practice and observation, and consists in a peculiar motion, by which the heavier substances sink to the bottom and remain there, while the soluble and lighter parts are washed out. The principal use of the wash-pan is in rewashing the partially washed 'stuff' taken from the rocker, and in prospecting to ascertain by trial the value of a new place.

This rocker, or cradle, may be made of half-inch soft-wood, and consists of a trough 10 inches deep, 18 inches broad, and 4 feet long, closed at the broad end, and open at the other; with a transverse bar at the upper part, two feet from the broad end, to receive the tray. This machine is placed on rockers, like a cradle, and deposited so near the water that, when at work, the man who rocks with his left hand may be able to reach the water with a small tin baler, provided with a wooden handle two feet long. A bucketful of the earth to be washed is thrown into the tray, and the person who is to rock the cradle taking a balerful of water, throws it uniformly on the mass in the tray, and keeps rocking and washing till the gold becomes obvious. These are the simpler implements of gold-hunting; and provided with them, the little company of adventurers pitch their tent and continue to dig, till they come to earth they think will pay for washing. The next morning, they get up perhaps at daylight, for the sake of the coolness of the hour, and pass through the sieve ten or fifteen buckets before breakfast. After breakfast, all hands resume work till about twelve o'clock, when they dine, then rest through the heat of the day till three o'clock, and go on again till dark. They usually divide the work as follows: one in the hole

digs, fills the bucket with earth, and, if necessary, bales the water out of the hole; another takes the bucket and empties it into the tray of the machine; while a third rocks, supplies the machine with water, and empties the tray of the large stones. This, it will be seen, is no child's play: your gold-hunter is no idle wanderer, but a hard-working man, subjected to a thousand discomforts unknown in civilised life.

The quicksilver cradle is a more complicated and expensive machine, requiring six men instead of three to work it. It is understood, however, to save at least 20 per cent. of the metal, and indeed to be indispensable in some places in California, where the gold is in too fine particles to be detected by the common rocker. Quicksilver has so strong an affinity for gold, that the minutest particle of the latter having once touched, it is deprived of the possibility of escape; and when the process of washing has been completely gone through, the whole mass of gold particles will be found bound together by the quicksilver into a compact lump, in size and shape often resembling an egg. The gold is thus obtained in the form of an amalgam; but the quicksilver is easily evaporated, if its loss be of no consequence, or separated without loss by a more scientific process.

We have more than once used the word *prospecting*, which, we believe, is peculiar to this kind of mining. The deposits of gold are so capricious, that the adventurers, in order to lose as little time as possible in removing from place to place, detach one of their number on the hunt for a mine—and this is called prospecting. He sets out with a few provisions, a rifle, a pick and shovel, at all events, with a pan and large knife; and on reaching some hopeful-looking locality, he makes experiments on the soil by washing. The considerations that determine his calling the company to the spot are of course influenced by the circumstance of their having a common or a quicksilver cradle. He calculates the average value of the gold he finds in several panfuls of the soil at different depths; and he takes into account the distance it has to be carried for washing, the means of transit there exist, and how far off is the nearest store. The prospector, therefore, is a very important member of the concern, and in many cases the success of the adventure depends upon his experience and sagacity.

THE HISTORY OF JANE A POOLE.

IN the latter part of the fourteenth century, an incident occurred in the family of the Earl of Suffolk, which affords a curious illustration of old manners in England. We shall follow the account of the circumstance, given in a manuscript in the British Museum.

Sir Michel Poole, second Earl of Suffolk, had several sons and daughters. First was Mighell, son and heir; then William, second son; and afterwards ten additional olive branches, of diverse names and both sexes—all of whom, however, died, and went down unmarried to the cold tomb. Some fell off like nipped blossoms in their infancy; convents and wars absorbed the rest, till only the eldest two were left of all that numerous family to perpetuate the name of Poole, and raise the fortunes of the race. In due course of time, Sir Mighell married Elizabeth, daughter of the right noble knight, Thomas Duke of Norfolk; and these together had two children, Jane and Katharine, but, alas! no son. Years passed on, and the hope of an heir was at an end; but before that hope was quite laid aside, the tragedy of the house began.

Jane, as yet heiress and darling, a round, bright, wilful cherub, beautiful and loving, but mighty in her passionate force, and indomitable in her infant will, beyond all power of control—the one most cared for,

and on whom was anchored such a rich argosy of hopes and first fond love—was one day given into the safe keeping of Maud, a young serving-girl, a rough, untutored peasant-girl, who was one of the underwomen to the bower-maidens. The king was coming to the castle that night, and every female finger that could work was employed on the last stitches of a dainty tapestry-bed, which was to receive His Majesty as became his lordly dignity. Even the mother's care must give way to the housewife's duty; even love must yield to loyalty.

Left alone in an upper apartment with her young charge, Maud became weary of confinement, and resolved at all hazards to descend to the great hall, and have her share of the general amusement. Down, accordingly, she went. Jane, of course, accompanied her, and, contrary to orders, was allowed to romp about at pleasure. The day was cold, and the fire burned brightly in the open hearth. Nearer and nearer the little one crept to the blazing logs, watching the sparks fly up in a golden shower when the crackling masses fell to the ground, or when some rough soldier struck them with his mailed hand. No one looked to her while she played by the open hearth, and tried to seize the vivid sparks; once only, a trooper caught her roughly back; but again she stole towards the great blazing logs, and this time she was less fortunate. Suddenly, a cry was heard. Jane's clothes were in flames. Maud extinguished them as she best could. She crushed the burning with her hands in such haste as she might make; but, alas! to what a wreck had the fire reduced the child! Her long fair hair was withered to its roots; her pretty eyes were closed, and the curling lashes scorched to the skin; her pure neck was blackened and blistered; and, a mass of pain and sore, she lay like a dead thing, but for the wailing moans which shewed her sad title yet to a ruined existence. Alas for her that she did not die! Wo, that life was so strong in her now, when, blemished and disfigured for ever, she might not hold its honours or taste its joys!—now, when she must endure a worse thing than death for the sake of her family name! 'Therefore,' says the chronicle, 'she was in a manner loathed of her parents, and kept forth secretly from the common knowledge of the people.'

'The house of Poole must have no charred mummy for its heiress,' said old Dame Katharine; and Sir Mighell and his lady bowed their heads and acquiesced.

It was agreed, then, that she should be sent to a house of 'close nuns,' to be made a woman of religion, and so kept out of the sight of all men's eyes. With this view, she was brought up; taught nothing else; suffered to hope for nothing else; suffered to speak of nothing else. But they could not bind her thoughts; and by a strange perversity of will, these went always to the open fields and the unfettered limb, to the vague picturing of freedom, and the dreamy forecast of love. Yet she kept her peace; not daring to tell her mind to any, and nourishing all the more strongly, because in silence, the characteristics which destroyed the charm of a conventual life. When she came to the years of discretion, she was to be professed; but, in accordance with an old custom, before her profession she required to enter the world for a season, that her 'vocation' might be judged of, whether it were true or not, or simply the effect of education on the one hand, and of ignorance on the other; and thus, when she was fifteen years of age, she was dismissed to her father's house for the space of six months' nominal trial, after which time she must return to the convent for ever.

Now, Dame Katharine a Poole, Jane's paternal grandmother, was a fierce, proud old woman, whose heart was set on the creation of her son's house, and whose very virtue was her family pride. When she heard of Jane's return to the outer world of men, she

hastily rode over to see this ugly, despised thing, and to take her from her father's castle to the grim quiet of her own dungeon-like home, if so be that she was as unlovely as report had spoken her. They met; and for a moment the proud old dame was struck as by death. The seamed and scarred face, the closed eyes—one perfectly sightless, the other well-nigh so—the burnt and withered hair growing in long, ragged patches only, the awkward gait and downcast look; all were like daggers in Dame Katharine's heart; and 'she rebuked her greatly, seeing that she was too loathly for any gentleman who was equal to her in birth.'

Poor Jane bore all these coarse reproaches with much outward meekness; but the spirit which they woke up in her was little interpreted by the drooping head and tearful eyes. A fiery demon, breathing rage and vowing revenge, took such meek-seeming as this, and blinded the old grandam to the mischief she was working, until it was too late to repair it. Dame Katharine took the girl home; Sir Mighell and his wife consenting in gratitude to be so well delivered from such a heavy burden. Dame Elizabeth, the girl's mother, truly shed a few tears, quickly dried; and so young Jane parted for ever from her father's house.

Like a dead thing, revived by the fresh winds of heaven, Jane's comparative freedom aroused in her the most passionate abhorrence of the life to which she was destined, and the most passionate desire for liberty and affection. With each breath she drew by the open casement, with each glance cast into the depths of the dark woods beyond, rose up the strong instincts of her age, and turned her for ever from the convent gate. In vain the dame insisted; Jane stood firm; and declared that she would still refuse, at the very altar, to take the vow. Yet was she timid in all things but those of love and liberty; and Dame Katharine, by violence and threats, so worked on her fears, that she at last consented, amid grievous tears and bitter reproaches, to be deprived of her name and state, and given forth to the castle people as a poor gentlewoman, godchild to the dame.

'Anything for freedom!' sighed Jane, as she took the oath of secrecy. 'Any deprivation rather than that living tomb of the nun!'

It was now the dame's chief care to be rid of her charge. She cast about for suitors, but even the lowest squire shook his head at the offer. At last, she married her grandchild to the son of an honest yeoman of Suffolk, and so sent her forth to take her place in the world as the wife of a common peasant, and the mother of a family of peasants. Such was the fate allotted to Jane a Poole, daughter of the proud Earl of Suffolk!

Of her issue, we need say but little. Suffice it to know, that Jane and her ploughman William had four children, three sons and one daughter; of whom William, the second son, married an honest man's daughter, whose name was Alice Gryse, and whose children were living in 1490, when this chronicle was written.

Return we now to the puissant lord, Sir Mighell, Earl of Suffolk. He was not long suffered to enjoy his home; indeed, so ardent a soul as his would have eaten its way through his castle walls, as a chrysalis through its silken tomb, if he had been long inactive. If war had not been his duty, he must have made it his crime; if foreign foes had not called upon his valour, too surely would domestic friends have suffered from his disloyalty. Born for the fight, he would have fulfilled his destiny by force if he might not by right. At the battle of Agincourt (1415), he perished along with many other of England's nobles.

Sir Mighell having died without a son, his titles and estates went to his brother, Sir William. Dame Elizabeth, widow of Sir Mighell, and her daughter Katharine, shortly afterwards, as was usual in these

times, went to reside in the Abbey of Brasenode; and there they ultimately died.

Meanwhile, and for years afterwards, no one knew anything of Jane, who, though exiled from her rank and family, perhaps enjoyed more real happiness than those who had been guilty of her maltreatment. At length, her husband died, which was a source of grief. Honest William had thought her queer in manners; but he loved her for all that, and was proud of her, as the daughter of a poor gentleman. He blessed her on his death-bed; and she remained a widow for his sake. Many yeomen wished to marry her, but she refused them all. This went on for many years—long after Sir William a Poole had become fourth Earl of Suffolk, and had had children born to him; long after Alice Gryse had become Jane's daughter-in-law, and made her more than once a grandmother too; and then the whole of this strange story became known. Jane had kept her vow of secrecy with perfect fidelity; never had she breathed a syllable to her husband or children as to the family to which she belonged. It was only, late in life, through confession she made to a priest, that who and what she had been was revealed. Shocked with the depravity of her unnatural parents, this pious and learned doctor, says the chronicle, 'commanded her to publish this account to her children and their issues, that they might know of what race they came, if so be, by the great mercy of Providence, they might claim their own again. And not only to them, but also to make it known to all men, as far as was consistent with her own safety; for he said, that the great power of Almighty God should be published to all the world. For this reason was the chronicle written—that all men might take warning; for no deed of wickedness is done in the dark, which shall not be dragged forth to the light; and no oppression on the innocent shall prosper before the right hand of Eternal Justice.'

THINGS TALKED OF IN LONDON.

March 1852.

THE lecture experiment at the Museum of Practical Geology, in Jernyn Street, has proved eminently successful. There were a thousand more applications for tickets than could be supplied, in consequence of which the executive very wisely determined, that the course should be repeated until the demand was satisfied. This fact of numbers speaks highly in favour of the working-men of London—none others are admitted to the course here referred to; and once having got the knowledge, it is to be hoped they will be able to turn it to good account. One of the lecturers told me, that the hall is always crowded, and that a better-behaved auditory has seldom been seen in any quarter, which we may consider to be an encouraging sign of the times. The other courses are also going on for those who are able to pay high fees, and attend during the day. The titles of a few of the lectures will give you an idea of the nature of the instruction offered; namely—The Relations of Natural History to Geology and the Arts; On the Value of an Extended Knowledge of Mineralogy and the Processes of Mining; On the Science of Geology and its Applications; On the Importance of Special Scientific Knowledge to the Practical Metallurgist; and On the Importance of Cultivating Habits of Observation. You must remember, that the institution is a government school of mines as well as a museum of geology.

In connection with this, it may be mentioned that the Society of Arts are discussing a project for the 'affiliation' of all the literary, philosophical, scientific, and mechanics' institutions throughout the kingdom, with a view to render them less languid and more beneficial, than too many of them now are. Unity of purpose effected wonders with the Great Exhibition; and it is thought that the same cause should produce

a similar result in the educational and recreative establishments alluded to. There is a talk, also, of an assembling of most of the learned societies of our great city under one roof—a sort of Palace of Science, which has long been wanting in London, but which has long existed in Paris. Should this scheme be carried out, the philosophers might then adopt Brother Jonathan's motto—*E pluribus unum*. And, next, the Suburban Artisan School of Drawing and Modelling, established last year at Camden-Town, has succeeded so well that the committee, with Prince Albert as patron, have determined to establish four additional schools in our other suburban districts. These schools are to be open every evening for instruction, at a charge per month of 2s. No working-man in the metropolis after this need be ignorant of drawing. Then, again, a 'Department of Practical Art' is organised in connection with the Board of Trade, which, by means of travelling and stationary superintendents, and other officers, is to assist in the development of artistic talent, and its application to useful purposes, wherever it may be found.

Co-operation of some sort or other is the order of the day; and now a good deal of attention is excited by the announcement of an 'Athenæum Institute for Authors and Artists,' something different from the Guild of Literature and Art set afoot last winter, the object being to endeavour to form an incorporated association of the two classes mentioned—of course for their common benefit. The aid of the possessors of rank and wealth is to be asked at starting, because, as the promoters say, 'we think literature has a right to ask the assistance of these other two great powers of society, because it so materially assists them; and because, in many of its branches, it has no other mode of being paid by society. The severely scientific, the highly imaginative, the profoundly legislative authors, do not produce promptly marketable, though they produce priceless, works. La Place, Wordsworth, Bentham, could not have existed had they depended on the first product of their works; they would have perished before an acknowledging world could have given them bread.' They say, further, that 'the humblest literary man works for something more than hire, and produces something more effective than a mere piece of merchandise. His book is not only sold to the profit of the bookseller, but to the benefit of the public. The publisher pays for its mercantile value, but the public should reward the author for its moral and social effect, as they take upon themselves to punish, if it have an evil tendency.'

Whether the promoters are right or wrong in their views, will be best proved by the result; meantime, they put forth some good names as provisional president, vice-president, and managers, and propose that the Institute shall comprise four branches—namely, a Protective Society, a Philanthropic and Provident Fund, an Educational Association, and a Life-Assurance Department. The subscribers are to consist of two classes: those who give contributions for the benefit of the Institute, and those who seek to benefit themselves. The former are to be asked to insure their lives, for different rates of premium, the amounts to fall into the corporation at the decease of the subscribers; and thus a fund would be raised out of which, on certain conditions, participating subscribers would be able to secure a provision for old age, or premature decay of mental power, the means of educating their children, and leaving a *solatium* to their widows. If all this can be carried out, and if literary men, as a class, are capable of all that the prospectus of the new scheme implies, how much of distress and heart-breaking misery will be saved to society!

There are several subjects which, having recently been brought before our Horticultural Society, have somewhat interested gardening folk. At one of the meetings,

there was exhibited 'a very fine specimen of common mignonette,' which 'was stated to have been a single plant pricked out into a pot in January 1851, and shifted on until it had attained a large size. It was mentioned, that mignonette is not an annual, as many imagine it to be; but that it will become a woody shrub, and last for years, provided it is well managed, and kept free from frost and damp.' So runs the report in the society's journal.

There was, likewise, an exhibition of black Hamburg grapes by Mr Fry, a Kentish gardener, who made thereupon some observations, which appear to be deserving of wider circulation. The grapes were grown in a building seldom heated artificially, and were much attacked by mildew during the last two seasons, on which prompt measures were taken to diffuse perfectly dry 'sulphur vivum' throughout the house by means of a sulphurator, until fruit and foliage were completely but lightly coated. 'Fires were lighted, and the temperature kept up to from 80 to 90 degrees, ventilation being considerably diminished, and water in any form discontinued. After being subject to this treatment for about four or five days, the vines received a thorough syringing, which cleansed them from every particle of sulphur. With respect to the use of sulphur in killing mildew, many ladies and gentlemen,' adds Mr Fry, 'with whom I have conversed, consider it highly objectionable: they say, that they do not like the idea of eating sulphur with grapes; neither would any one, and I can prove to them that this need never be done; and, moreover, that the use of sulphur, when timely and judiciously applied, does not in any way deteriorate the fruit. I much question if the most practised eye could detect sulphur on the grapes exhibited, although they have been twice covered with it; and as to the mildew itself among vines, I fear it no more than I do green-fly among cucumbers, which is so soon deprived of existence by the fumes of tobacco.'

What is called 'a French sulphurator,' whose great merit appears to be 'simplicity and cheapness,' was also exhibited. It is described as 'a tin box for holding the sulphur, placed on the upper side of the pipe of a pair of common bellows. The sulphur gets into the pipe through small holes made for the purpose in the bottom of the box, and, in order that no stoppage may take place, a small hammer-head attached at the end of a slight steel-spring, is fixed on the under side of the bellows, a gentle tap from which, now and then, keeps up a continuous fall of sulphur into the pipe.' It is said, that 'these appliances, which may be attached to a pair of bellows for little more than sixpence, answer every purpose for which they are intended, equally as well as a more expensive machine.'

At the same time with this contrivance, some bunches of black Prince Grapes were shewn to the assembled horticulturists, which could only be preserved from mildew by frequent applications of sulphur. The bunches are to be afterwards cleaned by dipping in water, or what is considered preferable, 'syringing on all sides with a fine syringe,' which process, it is well to remember, disturbs the bloom on the fruit least when directed 'downwards, or obliquely, as rain would fall.'

As the season for gardening operations is coming on, Mr Rivers' account may be mentioned of his mode of growing strawberries in pots; it will be found to involve certain combinations opposed to ordinary practice. 'About the second week in July,' he says, he filled a number of six-inch pots 'with a compost of two-thirds loam, and one-third rotten dung, as follows: three stout pieces of broken pots were placed in the bottom, and a full handful of the compost put in; a stout wooden pestle was then used with all the force of a man's arm to pound it, then another handful and a pounding, and another, till the pot was brimful, and the compressed mould as hard as a barn-floor. The pots were then

taken to the strawberry-bed, and a runner placed in the centre of each, with a small stone to keep it steady. They were watered in dry weather, and have had no other care or culture. For two or three years, I have had the very finest crops from plants after this method, and those under notice promise well. If the pots are lifted, it will be apparent that a large quantity of food is in a small space. I may add, that from some recent experiments with compressed earth to potted fruit-trees, I have a high opinion of its effect, and I fully believe that we have yet much to learn on the subject.'

There is a committee sitting at the Admiralty, to devise a method for the uniform lighting of ships and steamers at night, the object being to diminish the chances of accident or error to vessels at sea. And apropos of this, Mr Babbage has published a plan which will effectually prevent one lighthouse being mistaken for another: it is, that every lighthouse, wherever situated, shall have a number—the numbers not to run consecutively—and no two adjoining lights to have the same numeral digits in the same place of figures. There would then be no need for revolving or flashing lights, as the only thing to be done would be to make each lighthouse repeat its own number all night long, or whenever it was illuminated. This is to be 'accomplished by enclosing the upper part of the glass cylinders of the argand burner by a thin tube of tin or brass, which, when made to descend slowly before the flame, and then allowed suddenly to start back, will cause an occultation and reappearance of the light.' The number of occultations denotes the number of the lighthouse. For instance, suppose the Eddystone to be 243, the two is denoted by two hidings of the light in quick succession; a short pause, and four hidings; another short pause, and three hidings, followed by a longer pause; after which the same process is repeated. It would not be easy to make a mistake, for the numbers of the lighthouses nearest to the Eddystone would be very different; and supposing that the boy sent aloft to watch for the light were to report 253 instead of 243, without waiting to correct his view, the captain, by turning to his book, would perhaps find that No. 253 was in the Straits of Sunda, or some equally remote situation, and would easily recognise the error. When we take into account the number of vessels lost by mistaking one lighthouse for another, the value of this proposal becomes apparent. Mr Babbage shews, that bell-strokes might be employed to announce the number of a beacon in foggy weather; and he believes that the time is not far distant when buoys will also be indicated by a light. Now that lighthouse dues are to be reduced one-half, we may hope to see improvement in more ways than one.

This is but a small part of what promises more and more to become a great question—that of navigation. It is felt that, in these go-ahead days, we must be paying not less attention to our maritime than to our inland arm of commerce; and this has brought the question of wood *versus* iron ships again into prominent notice. The advocates of iron shew that the dry-rot, so destructive to wood, cannot enter metal; that lightness and speed, those prime essentials, are insured by the use of iron; that iron ships are safer, more easily repaired, and cheaper than vessels built of wood; and that they are more lasting. The chief objection hitherto has been the liability of iron to become foul in tropical climates; but this now appears to be in a measure overcome. According to Mr Lindsay: 'An admixture has been applied, termed "Anti-Sargassian Paint," which has been found to answer the purpose better than any yet discovered. From the experience of its properties, we cannot say that in itself it is yet sufficient; but it appears a fair substitute till some other preparation is discovered. A gentleman at Glasgow,' he adds, 'has already discovered a compound, which, being mixed in a fluid state with the iron, is

expected to answer the desired purpose. There is another disadvantage which will soon be overcome—the greater liability to error in the compasses of iron ships; an error which, however, also occurs, though perhaps to a less extent, in every wooden ship. By a most ingenious invention, which will shortly be made public, such errors in any ships, under any circumstances, can at all times be at once detected.

An important patented process for producing tapered iron, has been explained before the Franklin Institute at Philadelphia—one by which every variety of taper may be produced, or combinations of taper, with flat or other forms; and seeing how much tapered iron is used on railways, in many kinds of machinery, in ships and steamers, the subject may be considered worthy of more than a mere passing notice. Tapered iron is a form to which machinery has been thought inapplicable, and only to be produced by hand-labour. The new method, however, which has been successfully carried into practice at the Phoenixville Ironworks, is thus described: 'The principle on which it acts is that of hydrostatic pressure, or, more properly, *hydrostatic resistance*. A small chamber, similar to that of the common hydrostatic press, is set on the top of each housing; the closed end of the press being uppermost, and a plunger entering from below; but instead of water being forced into the press, the chamber is at first filled with water, and the pressure of the iron in passing between the rollers, tends to lift the top one, which is held down by the plunger. An escape-pipe, provided with a valve, is inserted into the top of the chamber. When any upward pressure acts on the top roller, it is communicated by the plunger to the water, which escapes through the valve, and the roller rises.

'When the valve is partially closed, the water escapes more slowly; and the rise of the roller, and consequently the taper of the iron, are more gradual.

'Any rate of taper may thus be had by regulating the rise of the opening of the escape-valve. If the water is all driven out before the bar is entirely through the rollers, the top roller ceases to rise, and the iron becomes parallel from that point. Then, if the ends of the bar be reversed, and it be again passed between the rollers, the parallel portion will become tapered; thus we can get a bar.'

At the same time, a 'Thermometrical Ventilator' was exhibited, which is described as circular in form, with a well-balanced movable plate. 'Upon the side of the valve is an inverted syphon, with a bulb at one end, the other being open; the lower part of the tube contains mercury; the bulb, atmospheric air. An increase of temperature expands the air in the bulb, drives the mercury down one side and up the other, thereby destroying the balance, and causing the valve to open by turning on its axis. A diminution of temperature contracts the air in the bulb, causes the mercury to rise in the side of the tube, and closes the valve.' Besides this, there was 'an improved magneto-electric machine, for medical use, with a new arrangement, by which the shock is graduated by means of a glass tube, in which a wire is made to communicate with water, so as to produce at first a slight shock; by gradually pressing down the wire attached to a spiral spring, the shock is received in its full force.'

It now appears that Mr Robertson of Brighton claims priority of discovery touching the boring power of *Pholades*. His statements are founded on daily observation of the creatures at work for three months. 'The *Pholades dactylus*,' he says, 'makes its hole by grating the chalk with its rasp-like valves, licking it up, when pulverised, with its foot, forcing it up through its principal or bronchial syphon, and squirting it out in oblong nodules. The crypt protects the *Pholades* from confervæ, which, when they get at it, grow not merely outside, but even within the lips of the valves, preventing the action of the syphons. In the foot there is a gelatinous

spring or style, which, even when taken out, has great elasticity, and which seems the mainspring of the motions of the *Pholades dactylus*.'

At last, steam communication with Australia seems about to become a reality, for the first vessel is announced to start in May for Sydney, to touch at the Cape and other colonies on her way out; and accommodation is promised for two hundred passengers of different classes. There is also a project on foot for a line of steamers from Panama to Australia, and to Valparaiso, which, if brought into operation, will make a voyage round the world little more than a bagman's journey. Apropos of Australia, Mr Clarke, who first predicted that gold would be found in that country, says, 'that just 90 degrees west of the auriferous range in Australia, we find an auriferous band in the Urals; and just 90 degrees west of the Urals, occur the auriferous mountains of California.' A speculation for cosmogonists. In our own country, we are finding metalliferous deposits: vast accumulations of lead-ore have come to light in Wales, which are said to contain six ounces of silver, and fifteen hundredweight of lead to the ton; and in Northamptonshire, an abundant and timely supply of iron-ore has just been met with. We might perhaps turn our metallic treasures to still better account, if some one would only set to work and win the prize offered by Louis Napoleon; namely, 'a reward of 50,000 francs to such person as shall render the voltaic pile applicable, with economy, to manufactures, as a source of heat, or to lighting, or chemistry, or mechanics, or practical medicine.' The offer is to be kept open for five years, to allow full time for experiment, and people of all nations have leave to compete. One of the electric telegraph companies intends to ask parliament to abolish the present monopoly as regards the despatch of messages; in another quarter, an under-sea telegraph to Ostend is talked about, with a view to communicate with Belgium independently of France; and there is no reason why it should not be laid down, for the Dover and Calais line is paying satisfactorily. And, finally, another ship-load of 'marbles' and sculptures has just arrived from Nineveh; and the appointment of Mr Layard as Under-Secretary for Foreign Affairs (though now but temporary) is regarded as a praiseworthy recognition of his merits and services; and now that we have a government which combines a few *littérateurs* among its members, it is thought that literature will be relieved of some of its trammels.

CHILDREN'S JOYS AND SORROWS.

I can endure a melancholy man, but not a melancholy child; the former, in whatever slough he may sink, can raise his eyes either to the kingdom of reason or of hope; but the little child is entirely absorbed and weighed down by one black poison-drop of the present. Think of a child led to the scaffold, think of Cupid in a Dutch coffin; or watch a butterfly, after its four wings have been torn off, creeping like a worm, and you will feel what I mean. But wherefore! The first has been already given; the child, like the beast, only knows purest, though shortest sorrow; one which has no past and no future; one such as the sick man receives from without, the dreamer from himself into his æsthetic brain; finally, one with the consciousness not of guilt, but of innocence. Certainly, all the sorrows of children are but shortest nights, as their joys are but hottest days; and indeed both so much so, that in the latter, often clouded and starless time of life, the matured man only longingly remembers his old childhood's pleasures, while he seems altogether to have forgotten his childhood's grief. This weak remembrance is strangely contrasted with the opposing one in dreams and fevers in this respect, that in the two last it is always the cruel sorrows of childhood which return; the dream this mock-sun of childhood—and the fever, its distorting glass—both draw forth from dark corners the fears of

defenceless childhood, which press and cut with iron fangs into the prostrate soul. The fair scenes of dreams mostly play on an after-stage, whereas the frightful ones choose for theirs the cradle and the nursery. Moreover, in fever, the ice-hands of the fear of ghosts, the striking one of the teachers and parents, and every claw with which fate has pressed the young heart, stretch themselves out to catch the wandering man. Parents, consider then, that every childhood's Rupert—the name given in Germany to the fictitious being employed to frighten children into obedience—even though it has lain chained for tens of years, yet breaks loose and gains mastery over the man so soon as it finds him on a sick-bed. The first fright is more dangerous the sooner it happens: as the man grows older, he is less and less easily frightened; the little cradle or bed-canopy of the child is more easily quite darkened than the starry heaven of the man.—*Jean Paul Richter.*

A REJECTED LOVER.

You 'never loved me,' Ada!—Those slow words
Dropped softly from your gentle woman's tongue,
Out of your true and tender woman's heart,
Dropped—piercing into mine like very swords,
The sharper for their brightness! Yet no wrong
Lies to your charge; nor cruelty, nor art;
Even while you spoke, I saw the ready tear-drop start.

You 'never loved me?'—No, you never knew—
You, with youth's dewy yet glittering on your soul—
What 'tis to love. Slow, drop by drop, to pour
Our life's whole essence, perfumed through and through
With all the best we have, or can control,
For the libation; cast it down before
Your feet—then lift the goblet, dry for evermore!

I shall not die, as foolish lovers do:
A man's heart beats beneath this breast of mine;
The breast where—Curse on that fiend's whispering,
'It might have been!'—Ada, I will be true
Unto myself—the self that worshipped thine.
May all life's pain, like those few tears that spring
For me—glance off as rain-drops from my white dove's
wing!

May you live long, some good man's bosom-flower,
And gather children round your matron knees!
Then, when all this is past, and you and I
Remember each our youth but as an hour
Of joy—or torture; one, serene, at ease,
May meet the other's grave yet steadfast eye,
Thinking, 'He loved me well!'—clasp hands, and so
pass by.

THE TEARS OF OYSTERS.

Glancing round this anatomical workshop (the oyster), we find, amongst other things, some preparations shewing the nature of pearls. Examine them, and we find that there are dark and dingy pearls, just as there are handsome and ugly men; the dark pearl being found on the dark shell of the fish, the white brilliant one upon the smooth inside shell. Going further in the search, we find that the smooth, glittering lining, upon which the fish moves, is known as the *nacre*, and that it is produced by a portion of the animal called the *mantle*; and, for explanation's sake, we may add that gourmands practically know the mantle as the beard of the oyster. When living in its glossy house, should any foreign substance find its way through the shell to disturb the smoothness so essential to its ease, the fish coats the offending substance with *nacre*, and a pearl is thus formed. The pearl is, in fact, a little globe of the smooth, glossy substance yielded by the oyster's beard; yielded ordinarily to smooth the narrow home to which his nature binds him, but yielded in round drops, real pearly tears, if he is hurt. When a beauty glides among a throng of her admirers, her hair clustering with pearls, she little thinks

that her ornaments are products of pain and diseased action, endured by the most unpoetical of shell-fish.—*Leisure Hours.*

'ROBESPIERRE.'

In our recent notice of Robespierre, it was mentioned that, at the period of his capture in the Hôtel de Ville, he was shot in the jaw by a pistol fired by one of the gendarmes. Various correspondents point to the discrepancy between this account and that given by Thiers, and some other authorities, who represent that Robespierre fired the pistol himself, in the attempt to commit self-destruction. In our account of the affair, we have preferred holding to Lamartine (*History of the Girondists*), not only in consequence of his being the latest and most graphic authority on the subject, but because his statement seems to be verified by the appearance of the half-signed document which it was our fortune to see in Paris in 1849.

The following is Lamartine's statement:—'The door soon yielded to the blows given by the soldiers with the but-end of their muskets, amid the cries of "Down with the tyrant!" "Which is he?" inquired the soldiers; but Léonard Bourdon durst not meet the look of his fallen enemy. Standing a little behind the men, and hidden by the body of a gendarme, named Méda; with his right hand he seized the arm of the gendarme who held a pistol, and pointing with his left hand to the person to be aimed at, he directed the muzzle of the weapon towards Robespierre, exclaiming: "That is the man." The man fired, and the head of Robespierre dropped on the table, deluging with blood the proclamation he had not finished signing.' Next morning, adds this authority, Léonard Bourdon 'presented the gendarme who had fired at Robespierre to the notice of the Convention.' Further: on Robespierre being searched while he lay on the table, a brace of loaded pistols were found in his pocket. 'These pistols, shut up in their cases still loaded, abundantly testify that Robespierre did not shoot himself.' Accepting these as the true particulars of the incident, Robespierre cannot properly be charged with an attempt at suicide.

In the article referred to, the name Barras was accidentally substituted for Henriot, in connection with the insurrectionary movement for rescuing Robespierre. Barras led the troops of the Convention.

A correspondent asks us to state what was the actual number of persons slaughtered by the guillotine, and otherwise, during the progress of the Revolution. The question cannot be satisfactorily answered. Alison (vol. iv. p. 289) presents a list, which shows the number to have been 1,027,106; but this enumeration does not comprehend the massacres at Versailles, the prisons of Paris, and some other places. A million and a half would probably be a safe calculation. One thing is certain, that from the 2d of September 1792, to the 25th of October 1795, a space of little more than three years, 18,613 persons perished by the guillotine. Strangely enough, the chief destruction of life was among the humbler classes of society, those who mainly promoted the revolution; and still more strange, the greater number of victims were murdered by the verdicts of juries—a striking example of that general subserviency which has since become the most significant defect in the French character.

Just Published, Price 6d. Paper Cover,

CHAMBERS'S POCKET MISCELLANY: forming a LITERARY COMPANION for the RAILWAY, the FIRESIDE, or the BUS.

VOLUME IV.

To be continued in Monthly Volumes.

Printed and Published by W. and A. CHAMBERS, High Street, Edinburgh. Also sold by W. R. ORR, Ainen Corner, London; D. N. CHAMBERS, 55 West Nile Street, Glasgow; and J. M'GLASSAY, 50 Upper Sackville Street, Dublin.—Advertisements for Monthly Parts are requested to be sent to MAXWELL & Co., 31 Nicholas Lane, Lombard Street, London, to whom all applications respecting their insertion must be made.

No. 431. NEW SERIES.

SATURDAY, APRIL 3, 1852.

PRICE 1½d.

IMPERFECT RESPECTABILITIES.

EVERYBODY must have had some trouble in his time with imperfect respectabilities. Nice, well-dressed, well-boused, civil, agreeable people are they. No fault to find with them but that there is some little flaw in their history, for which the very good (rigid) don't visit them. The degree to which one is incommoded with imperfect respectabilities, depends of course a good deal upon the extent of his good-nature, or his dislike of coming to strong measures in social life. Some have an inherent complaisance which makes them all but unfit for any such operation as cutting, or even for the less violent one of cooling off. Some take mild views of human infirmity, and shrink from visiting it too roughly. They would rather that the sinners did not cross them; but, since the contrary is the fact, what can they do but be civil?

One great source of perplexity in the case, is the excessive urbanity of the imperfect respectabilities themselves. They come up to you on the street with such sunny faces, and have so many kind inquiries to make, and so many pleasant things to say, that, for the life of you, you cannot stiffen up as you ought to do. Some haunting recollection of a bad affair of cards, or some awkward circumstances attending an insolvency, will come across your mind, and make you wish the fellow in the next street; but, unluckily, there he is, cheerful, even funny, talking of all sorts of respectable things, such as the state of the money-market, and what Sir George said to him the other day about the reviving prospects of Protection; and what avails your secret writhing? He holds you by the glittering eye. You listen, you make jocular observations in reply; the cards and the insolvency vanish from your thoughts; you at length shake hands, and part in a transport of good-humoured old acquaintanceship, and not till you have got a hundred yards away, do you cool down sufficiently to remember that you have made a fool of yourself by patronising an imperfect respectability.

It is, after all, not a harsh and censorious world. Let the imperfect respectabilities bear witness. If rigid justice held rule below, or men were really persecutors of each other, there would be no life for that class. In point of fact, they not only live, but sometimes do tolerably well in the world. They only could do so by virtue of a certain mutual tolerance which pervades society. It is a nice matter, however, to say what degree of imperfect respectability will be endured. Some things, we all know, cannot be forgiven upon earth; and in such cases there is no resource but in obscurity. But there is also a large class of offences, the consequences of which may be overcome. Perhaps

the facts do not come fully out into general notice. Perhaps there may be some little thing to say in exculpation. If the offender can, after a short space, continue to make his usual personal appearances, he is safe, because the great bulk of his old friends would rather continue to recognise him, than come to a positive rupture—an event always felt as inconvenient. Of course, they will be too well-bred to allude before him to any unpleasant fact in his history. He will never recall it to their minds. By being thus thrown out of all common reference, it will become obscured to a wonderful degree, inasmuch that many will at length think of it only as a kind of domestic myth, to which no importance is to be attached. Thus Time is continually bringing in his bills of indemnity in favour of these unconfessing culprits. Were the world as harsh as is said, we should rather be having *post-facto* acts to punish them, supposing that existing statutes were insufficient.

One of the most curious points in the physiology of an imperfect respectability, is the fact of his almost always having something remarkably agreeable and attractive about him. Going down a peg in reputation seems somehow to have a specific effect upon the temper. From a bear it will convert a man into a perfect lamb. He becomes obliging to the last degree, has a kind word for everybody, and is never so happy as when he is allowed to render you some disagreeable piece of service. Scott, who knew everything, knew this, and hence it was that he made Glossin so very polite to the ostler at Kippeltringan. When a stranger comes to settle in a country place, the imperfect respectability is sure to be amongst the first to call and offer his services. He likes a new family, and thinks it a duty to be ready to do the honours of the place. He is also, to a remarkable degree, a family man. None is seen so often going about with wife and daughters. In fact, he is exemplary in this respect. Few pews, moreover, so regularly filled as his. When a subscription is got up, it is a positive pleasure to him to subscribe; ten times more to be allowed to come upon the committee, and join other two in going about with a paper. The effect of all this is, that the imperfect respectable is often a highly popular character. Everybody likes him, and wishes him at the devil.

When the case is so strong that disappearance is imperatively necessary, then of course disappear he must. Every now and then, some one of our old friends is thus dropping through the trap-doors of the social stage, to be seen and heard of no more. In travelling, one is apt to come upon some old-remembered face, which he had been accustomed to in such different circumstances that he has a difficulty in recognising

it. It may be in some village obscurity of our own country, some German watering-place, or some American wilderness. There it is, however, the once familiar face; and you cannot pass it unheeded. You soon discover that you have lighted upon an imperfect respectability in exile. He is delighted to see you, seems in the highest spirits, and insists on your coming home to see Mrs —, and dine or spend the night. He has never been better off anywhere. All goes well with him. It was worth his while to come here, if only for the education of his family. As he rattles on, speaking of everything but the one thing you chiefly think of, you cannot help being touched in spirit. You feel that there may be things you can respect more, but many you respect that you cannot love so much.

While the imperfect respectability bears up so well before his old acquaintance, who can tell what may be the reflections that visit his breast in moments of retirement? Let us not be too ready to set him down as indifferent to the consequences of the sin which once so unfortunately beset him. Let us not too easily assume that he has not felt the loss of place and reputation, because he laughs and chats somewhat more than he used to do. I follow my poor old friend to his home, and there see him in his solitary hours brooding over the great forfeit he has made, and bitterly taxing himself with errors which he would be right loath to confess to the world. He knows what men think and say of him behind his back, notwithstanding that not a symptom of the consciousness escapes him. And let us hope that, in many cases, the contrite confession which is withheld from men is yielded where it is more fitly due.

TALES OF THE COAST-GUARD.

THE LAST REVEL.

WHEN I was quite a lad, a servant lived with us of the name of Anne Stacey. She had been in the service of William Cobbett, the political writer, who resided for some years at Botley, a village a few miles distant from Itchen. Anne might be about two or three and twenty years of age when she came to us; and a very notable, industrious servant she was, and remarked, moreover, as possessing a strong religious bias. Her features, everybody agreed, were comely and intelligent. But that advantage in the matrimonial market was more than neutralised by her unfortunate figure, which, owing, as we understood, to a fall in her childhood, was hopelessly deformed, though still strongly set and muscular. Albeit, a sum of money—about fifty pounds—scraped together by thrifty self-denial during a dozen years of servitude, amply compensated in the eyes of several idle and needy young fellows for the unlovely outline of her person; and Anne, with an infatuation too common with persons of her class and condition, and in spite of repeated warning, and the secret misgivings, one would suppose, of her own mind, married the best-looking, but most worthless and dissipated of them all. This man, Henry Ransome by name, was, I have been informed, constantly intoxicated during the first three months of wedlock, and then the ill-assorted couple disappeared from the neighbourhood of Itchen, and took up their abode in one of the hamlets of the New Forest. Many years afterwards, when I joined the Preventive Service, I frequently heard mention of his name as that of a man singularly skilful in defrauding the revenue, as well as in avoiding the penalties which surround that dangerous vocation.

One day, he was pointed out to me when standing by the Cross-House near the Ferry, in company with a comparatively youthful desperado, whose real name was John Wyatt, though generally known amongst the smuggling fraternity and other personal intimates, by the *sobriquet* of Black Jack—on account, I suppose, of his dark, heavy-browed, scowling figure-head, one of the most repulsive, I think, I have ever seen. Anne's husband, Henry Ransome, seemed, so far as very brief observation enabled me to judge, quite a different person from his much younger, as well as much bigger and brawnier associate. I did not doubt that, before excessive indulgence had wasted his now pallid features, and sapped the vigour of his thin and shaking frame, he had been a smart, good-looking chap enough; and there was, it struck me, spite of his reputation as 'a knowing one,' considerably more of the dupe than the knave, of the fool than the villain, in the dreary, downcast, skulking expression that fitted over his features as his eye caught mine intently regarding him. I noticed also that he had a dry, hard cough, and I set down in my own mind as certain that he would, ere many months passed away, be consigned, like scores of his fellows, to a brandy-hastened grave. He indicated my presence—proximity, rather—to Wyatt, by a nudge on the elbow, whereupon that respectable personage swung sharply round, and returned my scrutinising gaze by one of insolent defiance and bravado, which he contrived to render still more emphatic by thrusting his tongue into his cheek. This done, he gathered up a coil of rope from one of the seats of the Cross-House, and said: 'Come, Harry, let's be off. That gentleman seems to want to take our picture—on account that our mugs are such handsome ones, no doubt; and if it was a mildish afternoon, I shouldn't mind having mine done; but as the weather's rather nippy like, we'd better be toddling, I think.' They then swaggered off, and crossed the Ferry.

Two or three weeks afterwards, I again met with them, under the following circumstances:—I landed from the *Rose* at Lympington, for the purpose of going by coach to Lyndhurst, a considerable village in the New Forest, from which an ex-chancellor derives his title. I had appointed to meet a confidential agent there at the Fox and Hounds Inn, a third-rate tavern, situate at the foot of the hill upon which the place is built; and as the evening promised to be clear and fine, though cold, I anticipated a bracing, cross-country walk afterwards in the direction of Hythe, in the neighbourhood whereof dwelt a person—neither a seaman nor a smuggler—whose favour I was just then very diligently cultivating. It was the month of November; and on being set down at the door of the inn somewhere about six o'clock in the evening, I quietly entered and took a seat in the smoking-room unrecognised, as I thought, by any one—for I was not in uniform. My man had not arrived; and after waiting a few minutes, I stepped out to inquire at the bar if such a person had been there. To my great surprise, a young woman—girl would be a better word, for she could not be more than seventeen, or at the utmost eighteen years old—whom I had noticed on the outside of the coach, was just asking if one Dr Lee was expected. This was precisely the individual who was to meet me, and I looked with some curiosity at the inquirer. She was a coarsely, but neatly attired person, of a pretty figure, interesting, but dejected cast of features, and with large, dark, sorrowing eyes. Thoughtfulness and care were not less marked in the humble, subdued tone in which she spoke. 'Could I sit down anywhere till he comes?' she timidly asked, after hearing the bar-woman's reply. The servant civilly invited her to take a seat by the bar-fire, and I returned, without saying anything, to the smoking-room, rang the bell, and ordered a glass of brandy and

water, and some biscuits. I had been seated a very short time only, when the quick, consequential step, and sharp, cracked voice of Dr Lee sounded along the passage; and after a momentary pause at the bar, his round, smirking, good-humoured, knavish face looked in at the parlour-door, where, seeing me alone, he winked with uncommon expression, and said aloud: 'A prime fire in the smoking-room, I see; I shall treat myself to a whiff there presently.' This said, the shining face vanished, in order, I doubted not, that its owner might confer with the young girl who had been inquiring for him. This Lee, I must observe, had no legal right to the prefix of doctor tacked to his name. He was merely a peripatetic quack-salver and vender of infallible medicines, who, having wielded the pestle in an apothecary's shop for some years during his youth, had acquired a little skill in the use of drugs, and could open a vein or draw a tooth with considerable dexterity. He had a large, but not, I think, very remunerative practice amongst the poaching, deer-stealing, smuggling community of those parts, to whom it was of vital importance that the hurts received in their desperate pursuits should be tended by some one not inclined to babble of the number, circumstances, or whereabouts of his patients. This essential condition Lee, hypocrite and knave as he was, strictly fulfilled; and no inducement could, I think, have prevailed upon him to betray the hiding-place of a wounded or suffering client. In other respects, he permitted himself a more profitable freedom of action, thereto compelled, he was wont apologetically to remark, by the wretchedly poor remuneration obtained by his medical practice. If, however, specie was scarce amongst his clients, spirits, as his rubicund, carbuncled face flamingly testified, were very plentiful. There was a receipt in full painted there for a prodigious amount of drugs and chemicals, so that, on the whole, he could have had no great reason to complain. He soon reappeared, and took a chair by the fire, which, after civilly saluting me, he stirred almost fiercely, eyeing as he did so the blazing coals with a half-abstracted and sullen, cowed, disquieted look altogether unusual with him. At least wherever I had before seen him, he had been as loquacious and boastful as a Gascon.

'What is the matter, doctor?' I said. 'You appear strangely down upon your luck all at once.'

'Hush—hush! Speak lower, sir, pray. The fact is, I have just heard that a fellow is lurking about here— You have not, I hope, asked for me of any one?'

'I have not; but what if I had?'

'Why, you see, sir, that suspicion—calumny, Shakespeare says, could not be escaped, even if one were pure as snow—and more especially, therefore, when one is not quite so—so— Ahem!—you understand?'

'Very well, indeed. You would say, that when one is not actually immaculate—calumny, suspicion takes an earlier and firmer hold.'

'Just so; exactly—and, in fact—ha!—'

The door was suddenly thrown open, and the doctor fairly leaped to his feet with ill-disguised alarm. It was only the bar-maid, to ask if he had rung. He had not done so, and as it was perfectly understood that I paid for all on these occasions, that fact alone was abundantly conclusive as to the disordered state of his intellect. He now ordered brandy and water, a pipe, and a screw of tobacco. These ministrants to a mind disturbed somewhat calmed the doctor's excitement, and his cunning gray eyes soon brightly twinkled again through a haze of curling smoke.

'Did you notice,' he resumed, 'a female sitting in the bar? She knows you.'

'A young, intelligent-looking girl. Yes. Who is she?'

'Young!' replied Lee, evasively, I thought. 'Well,

it's true she is young in years, but not in experience—in suffering, poor girl, as I can bear witness.'

'There are, indeed, but faint indications of the mirth and lightness of youth or childhood in those timid, apprehensive eyes of hers.'

'She never had a childhood. Girls of her condition seldom have. Her father's booked for the next world, and by an early stage too, unless he mends his manners, and that I hardly see how he's to do. The girl's been to Lymington to see after a place. Can't have it. Her father's character is against her. Unfortunate; for she's a good girl.'

'I am sorry for her. But come, to business. How about the matter you wot of?'

'Here are all the particulars,' answered Lee, with an easy transition from a sentimental to a common-sense, business-like tone, and at the same time unscrewing the lid of a tortoise-shell tobacco-box, and taking a folded paper from it. 'I keep these matters generally here; for if I were to drop such an article—just now, especially—I might as well be hung out to dry at once.'

I glanced over the paper. 'Place, date, hour correct, and thoroughly to be depended upon you say, eh?'

'Correct as Cocker, I'll answer for it. It would be a spicy run for them, if there were no man-traps in the way.'

I placed the paper in my waistcoat-pocket, and then handed the doctor his preliminary fee. The touch of gold had not its usual electrical effect upon him. His nervous fit was coming on again. 'I wish,' he puffed out—'I wish I was safe out of this part of the country, or else that a certain person I know was transported; then indeed!—'

'And who may that certain person be, doctor?' demanded a grim-looking rascal, as he softly opened the door. 'Not me, I hope?'

I instantly recognised the fellow, and so did the doctor, who had again bounded from his chair, and was shaking all over as if with ague, whilst his very carbuncles became pallid with affright. 'You—u—u,' he stammered—'You—u—u, Wyatt: God forbid!'

Wyatt was, I saw, muddled with liquor. This was lucky for poor Lee. 'Well, never mind if it was me, old brick,' rejoined the fellow; 'or at least you have been a brick, though I'm misdoubting you'll die a pantile after all. But here's luck; all's one for that.' He held a pewter-pot in one hand, and a pipe in the other, and as he drank, his somewhat confused but baleful look continued levelled savagely along the pewter at the terrified doctor. There was, I saw, mischief in the man.

'I'd drink yours,' continued the reckless scamp, as he paused for breath, drew the back of his pipe-hand across his mouth, and stared as steadily as he could in my face—'I'd drink your health, if I only knew your name.'

'You'll hear it plainly enough, my fine fellow, when you're in the dock one of these days, just before the judge sends you to the hulks, or, which is perhaps the likelier, to the gallows. And this scamp, too,' I added, with a gesture towards Lee, whom I hardly dared venture to look at, 'who has been pitching me such a pretty rigmarole, is, I see, a fellow-rogue to yourself. This house appears to be little better than a thieves' rendezvous, upon my word.'

Wyatt regarded me with a deadly scowl as he answered: 'Ay, ay, you're a brave cock, Master Warneford, upon your own dunghill. It may be my turn some day. Here, doctor, a word with you outside.' They both left the room, and I rang the bell, discharged the score, and was just going when Lee returned. He was still pale and shaky, though considerably recovered from the panic-terror excited by the sudden entrance of Wyatt.

'Thank Heaven, he's gone!' said the doctor; 'and

less sour and suspicious than I feared him to be. But tell me, sir, do you intend walking from here to Hythe?' 'I so purpose. Why do you ask?'

'Because the young girl you saw in the bar went off ten minutes ago by the same road. She was too late for a farmer's cart which she expected to return by. Wyatt, too, is off in the same direction.'

'She will have company then.'

'Evil company, I fear. Her father and he have lately quarrelled; and her, I know, he bears a grudge against, for refusing, as the talk goes, to have anything to say to him.'

'Very well; don't alarm yourself. I shall soon overtake them, and you may depend the big drunken bully shall neither insult nor molest her. Good-night.'

It was a lonely walk for a girl to take on a winter evening, although the weather was brilliantly light and clear, and it was not yet much past seven o'clock. Except, perchance, a deer-keeper, or a deer-stealer, it was not likely she would meet a human being for two or three miles together, and farm and other houses near the track were very sparsely scattered here and there. I walked swiftly on, and soon came within sight of Wyatt; but so eagerly was his attention directed ahead, that he did not observe me till we were close abreast of each other.

'You here!' he exclaimed, fairly gnashing his teeth with rage. 'I only wish'—

'That you had one or two friends within hail, eh? Well, it's better for your own health that you have not, depend upon it. I have four barrels with me, and each of them, as you well know, carries a life, one of which should be yours, as sure as that black head is on your shoulders.'

He answered only by a snarl and a malediction, and we proceeded on pretty nearly together. He appeared to be much soberer than before: perhaps the keen air had cooled him somewhat, or he might have been shamming it a little at the inn to hoodwink the doctor. Five or six minutes brought us to a sharp turn of the road, where we caught sight of the young woman, who was not more than thirty or forty yards ahead. Presently, the sound of footsteps appeared to strike her ear, for she looked quickly round, and an expression of alarm escaped her. I was in the shadow of the road, so that, in the first instance, she saw only Wyatt. Another moment, and her terrified glance rested upon me.

'Lieutenant Warnford!' she exclaimed.

'Ay, my good girl, that is my name. You appear frightened—not at me, I hope?'

'O no, not at you,' she hastily answered, the colour vividly returning to her pale cheeks.

'This good-looking person is, I daresay, a sweetheart of yours; so I'll just keep astern out of ear-shot. My road lies past your dwelling.'

The girl appeared to understand me, and, reassured, walked on, Wyatt lopping sullenly along beside her. I did not choose to have a fellow of his stamp, and in his present mood, walking behind me.

Nothing was said that I heard for about a mile and a half, when Wyatt, with a snarling 'good-night' to the girl, turned off by a path on the left, and was quickly out of sight.

'I am not very far from home now, sir,' said the young woman hesitatingly. She thought, perhaps, that I might leave her, now Wyatt had disappeared.

'Pray go on, then,' I said; 'I will see you safe there, though somewhat pressed for time.'

We walked side by side, and after awhile she said in a low tone, and with still downcast eyes: 'My mother lived servant in your family once, sir.'

'The deuce! Your name is Ransome, then, I suspect.'

'Yes, sir—Mary Ransome.' A sad sigh accompanied these words. I pitied the poor girl from my

heart, but having nothing very consolatory to suggest, I held my peace.

'There is mother!' she cried in an almost joyful tone. She pointed to a woman standing in the open doorway of a mean dwelling at no great distance, in apparently anxious expectation. Mary Ransome hastened forwards, and whispered a few sentences to her mother, who fondly embraced her.

'I am very grateful to you, sir, for seeing Mary safely home. You do not, I daresay, remember me?'

'You are greatly changed, I perceive, and not by years alone.'

'Ah, sir!' Tears started to the eyes of both mother and daughter. 'Would you,' added the woman, 'step in a moment. Perhaps a few words from you might have effect.' She looked, whilst thus speaking, at her weak, consumptive-looking husband, who was seated by the fireplace with a large green baize-covered Bible open before him on a round table. There is no sermon so impressive as that which gleams from an apparently yawning and inevitable grave; and none, too, more quickly forgotten, if by any resource of art, and reinvigoration of nature, the tombward progress be arrested, and life pulsate joyously again. I was about to make some remark upon the suicidal folly of persisting in a course which almost necessarily led to misery and ruin, when the but partially-closed doorway was darkened by the burly figure of Wyatt.

'A very nice company, by jingo!' growled the ruffian; 'you only want the doctor to be quite complete. But hark ye, Ransome,' he continued, addressing the sick man, who cowered beneath his scowling gaze like a beaten hound—'mind and keep a still tongue in that calf's head of yours, or else prepare yourself to—to take—to take—what follows. You know me as well as I do you. Good-night.'

With this caution, the fellow disappeared; and after a few words, which the unfortunate family were too frightened to listen to, or scarcely to hear, I also went my way.

The information received from Dr Lee relative to the contemplated run near Hurst Castle proved strictly accurate. The surprise of the smugglers was in consequence complete, and the goods, the value of which was considerable, were easily secured. There occurred also several of the ordinary casualties that attend such encounters—casualties which always excited in my mind a strong feeling of regret, that the revenue of the country could not be assured by other and less hazardous expedients. No life was, however, lost, and we made no prisoners. To my great surprise I caught, at the beginning of the affray, a glimpse of the bottle-green coat, drab knee-cords, with gaiter continuations, of the doctor. They, however, very quickly vanished; and till about a week afterwards, I concluded that their owner had escaped in a whole skin. I was mistaken.

I had passed the evening at the house whither my steps were directed when I escorted Mary Ransome home, and it was growing late, when the servant-maid announced that a young woman, seemingly in great trouble, after inquiring if Lieutenant Warnford was there, had requested to see him immediately, and was waiting below for that purpose. It was, I found, Mary Ransome, in a state of great flurry and excitement. She brought a hastily-scribbled note from Dr Lee, to the effect that Wyatt, from motives of suspicion, had insisted that both he and Ransome should be present at the attempt near Hurst Castle; that the doctor, in his hurry to get out of harm's way, had attempted a leap which, owing to his haste, awkwardness, and the frosty atmosphere and ground, had resulted in a compound fracture of his right leg; that he had been borne off in a state of insensibility; on recovering from which he found himself in Wyatt's power, who, by rifling his pockets, had found some memoranda that left no doubt of Lee's treason towards the smuggling

fraternity. The bearer of the note would, he said, further explain, as he could not risk delaying sending it for another moment—only he begged to say his life depended upon me.

'Life!' I exclaimed, addressing the pale, quaking girl; 'nonsense! Such gentry as Wyatt are not certainly particular to a shade or two, but they rarely go that length.'

'They will make away with father as well as Dr Lee,' she shudderingly replied: 'I am sure of it. Wyatt is mad with rage.' She trembled so violently, as hardly to be able to stand, and I made her sit down.

'You cannot mean that the scoundrel contemplates murder?'

'Yes—yes! believe me, sir, he does. You know the *Fair Rosamond*, now lying off Marchwood?' she continued, growing every instant paler and paler.

'The trader to St Michael's for oranges and other fruits?'

'That is but a blind, sir. She belongs to the same company as the boats you captured at Hurst Castle. She will complete landing her cargo early to-morrow morning, and drop down the river with the ebb-tide just about dawn.'

'The deuce they will! The cunning rascals. But go on. What would you further say?'

'Wyatt insists that both the doctor and my father shall sail in her. They will be carried on board, and—and when at sea—you know—you understand!'

'Be drowned, you fear. That is possible, certainly; but I cannot think they would have more to fear than a good keel-hauling. Still, the matter must be looked to, more especially as Lee's predicament is owing to the information he has given the king's officers. Where are they confined?'

She described the place, which I remembered very well, having searched it not more than a fortnight previously. I then assured her that I would get her father as well as Lee out of the smugglers' hands by force, if necessary; upon hearing which the poor girl's agitation came to a climax, and she went off into strong hysterics. There was no time to be lost, so committing her to the care of the servant, I took leave of my friends, and made the best of my way to Hythe, hard off which a boat, I knew, awaited me; revolving, as I sped along, the best mode of procedure. I hailed the boat, and instructed one of the men—Dick Redhead, he was generally called, from his fiery poll—a sharp, clever fellow was Dick—to proceed immediately to the house I had left, and accompany the young woman to the spot indicated, and remain in ambush, with both eyes wide open, about the place till I arrived. The *Rose* was fortunately off Southampton Quay; we soon reached her, shifted to a larger boat, and I and a stout crew were on our way, in very little time, to have a word with that deceitful *Fair Rosamond*, which we could still see lying quietly at anchor a couple of miles up the river. We were quickly alongside, but, to our great surprise, found no one on board. There was, however, a considerable quantity of contraband spirits in the hold; and this not only confirmed the girl's story, but constituted the *Fair Rosamond* a lawful prize. I left four men in her, with strict orders to lie close and not shew themselves, and with the rest hastened on shore, and pushed on to the doctor's rescue. The night was dark and stormy, which was so far the better for our purpose; but when we reached the place, no Dick Redhead could be seen! This was queer, and prowling stealthily round the building, we found that it was securely barred, sheltered, and fastened up, although by the light through the chinks, and a confused hum, it seemed, of merry voices, there was a considerable number of guests within. Still, Master Dick did not shew, and I was thoroughly at a loss how to act. It would not certainly have been difficult to force an entrance, but I doubted that I should be justified in

doing so; besides, if they were such desperadoes as Mary Ransome intimated, such a measure must be attended with loss of life—a risk not to be incurred except when all less hazardous expedients had failed, and then only for a sufficient and well-defined purpose. I was thus cogitating, when there suddenly burst forth, overpowering the howling of the wind and the pattering of the rain, a rattling and familiar chorus, sung by at least a dozen rough voices; and I had not a doubt that the crew of the *Fair Rosamond* were assisting at a farewell revel previous to sailing, as that Hope, which tells so many flattering tales, assured them they would, at dawn.

Such merriment did not certainly sound like the ferocious exultations of intending assassins; still, I was very anxious to make ten or a dozen amongst them; and continuing to cast about for the means of doing so, our attention was at length fixed upon a strange object, not unlike a thirty-six pounder red-hot round shot, not in the least cooled by the rain, projecting inquiringly from a small aperture, which answered for a window, half-way up the sloping roof. It proved to be Master Dick's fiery head, but he made us out before we did him. 'Is that Bill Simpson?' queried Dick, very anxiously. The seaman addressed, as soon as he could shove in a word edgewise with the chorus and the numerous wind-instruments of the Forest, answered that 'it was Bill Simpson; and who the blazes was that up there?' To which the answer was, that 'it was Dick, and that he should be obliged, if Bill had a rope with him, he would shy up one end of it.' Of course we had a rope: an end was shied up, made fast, and down tumbled Master Dick Redhead without his hat, which, in his hurry, it appeared, he had left behind in the banquetting-room. His explanation was brief and explicit. He had accompanied the young woman to the present building, as I ordered; and being a good deal wrought upon by her grief and lamentations, had suggested that it might be possible to get Dr Lee and her father to a place of safety without delay, proverbially dangerous. This seemed feasible; inasmuch as the fellow left in charge by Wyatt was found to be dead-drunk, chiefly owing, I comprehended, to some powerful ingredients infused in his liquor by Dr Lee. All was going on swimmingly, when, just as Dick had got the doctor on his back, an alarm was given that the crew of the *Fair Rosamond* were close at hand, and Dick had but just time to climb with great difficulty into the crazy loft overhead, when a dozen brawny fellows entered the place, and forthwith proceeded to make merry.

A brief council was now held, and it was unanimously deemed advisable that we should all climb up to Dick's hiding-place by means of the rope, and thence contrive to drop down upon the convivial gentlemen below, in as convenient a manner as possible, and when least expected. We soon scaled the loft, but after-proceedings were not so easy. The loft was a make-shift, temporary one, consisting of loose planks resting upon the cross rafters of the roof, and at a considerable height from the floor upon which the smugglers were carousing. It would, no doubt, have been easy enough to have slid down by a rope; but this would place the first three or four men, if no more, at the mercy of the contrabandists, who, I could see through the wide chinks, were all armed, and not so drunk but that they thoroughly knew what they were about. It behoved us to be cool, and consider well the best course to pursue. Whilst doing so, I had leisure to contemplate the scene below. Wyatt was not there; but around a table, lighted by two dip-candles stuck in the necks of black bottles, and provided with abundance of liquor, tobacco, tin pannikins, and clay-pipes, sat twelve or thirteen ill-favoured fellows, any one of whom a prudent man would, I am very sure, have rather trusted with a shilling than a sovereign. The

unfortunate doctor, pale and sepulchral as the death he evidently dreaded to be near at hand, was sitting propped up in a rude arm-chair; and Ransome, worse, I thought, than when I had seen him a few weeks previously, was reclining on a chest, in front of which stood his wife and daughter in a condition of feverish excitement. There at first appeared, from the temper of the roisterers, to be no cause for any very grave apprehension; but the aspect of affairs soon changed, and I eagerly availed myself of a suggestion of Dick Redhead's, and gave directions that preparation for its execution should be instantly and silently commenced. The thought had struck Dick when perched up there alone, and naturally looking about for all available means of defence, should he be discovered. Let me restate my position and responsibilities. It was my duty to rescue Lee, the agent of the Customs, from the dangerous predicament in which he was placed; and the question was, how to effect this without loss of life. It would, no doubt, have been easy enough to have turned up one or two of the loose planks, and have shot half the smugglers before they could have made their escape. This, however, was out of the question, and hence the adoption of Dick's proposal. It was this: in the loft where we lay, for stand upright we could not, there was, amongst several empty ones, one full cask, containing illicit spirits of some kind, and measuring, perhaps, between forty and fifty gallons. It was wood-hooped, and could be easily unheaded by the men's knives, and at a given signal, be soused right upon the heads of the party beneath, creating a consternation, confusion, and dismay, during which we might all descend, and end the business, I hoped, without bloodshed.

This was our plan, and we had need to be quick about it, for, as I have said, the state of affairs below had suddenly changed, and much for the worse. A whistle was heard without; the front entrance was hastily unbarred, and in strode Wyatt, Black Jack, and well did he on this occasion vindicate the justice of his popular designation. Everybody was in a moment silent, and most of those who could stood up. 'What's this infernal row going on for?' he fiercely growled. 'Do you want to get the sharks upon us again?' There was no answer, and one of the men handed him a pannikin of liquor, which he drank greedily. 'Lee,' he savagely exclaimed, as he put down the vessel, 'you set out with us in half an hour at latest.'

'Mercy, mercy!' gasped the nerveless, feeble wretch: 'mercy!'

'Oh, ay, we'll give you plenty of that, and some to spare. You, too, Ransome, prepare yourself, as well as your dainty daughter here'—He stopped suddenly, not, it seemed, checked by the frenzied outcries of the females, but by a renewed and piercing whistle on the outside. In the meantime, our fellows were getting on famously with the hoops of the huge spirit-cask. 'Why, that is Richards' whistle,' he exclaimed. 'What the furies can this mean? Unbar the door!'

This was instantly done, and a man, a sailor by his dress, rushed in. 'The *Fair Rosamond* is captured, and the preventive men are in possession of her.'

My 'Quick! quick!' to the men, though uttered too loud, from the suddenness of the surprise, was happily lost in the rageful outburst of Wyatt. 'Hell-fire!' he roared out. 'But you lie; it cannot be.'

'It is true,' rejoined the man. 'I and Clarke went on shore about an hour ago in the punt, just to get a nip of brandy this cold night, as you won't let us break bulk on board. When we returned, Tom went up the side first, was nabbed, and I had hardly time, upon hearing him sing out, to shove off and escape myself.'

We were now ready, and two of the planks just over Wyatt's head were carefully turned over. He seemed for a moment paralysed—for a moment only.

Suddenly he sprang towards Mary Ransome, grasped her hair with one hand, and in the other held a cocked pistol: 'You,' he shouted—'you, accursed minx, have done this. You went out two hours ago!'

I lifted my hand. 'Hurra! Take that, you cowardly lubber!' roared Dick Redhead; and down went the avalanche of liquid, knocking not only the pistol out of Wyatt's hand, but himself clean off his legs, and nearly drowning Mary Ransome, her mother, and half-a-dozen others. A rope had been made fast to one of the rafters, down which we all quietly slid before the astonished smugglers could comprehend what had happened. Resistance was then out of the question, and they did not attempt it. I took Wyatt and one or two others into custody, for having contraband spirits in their possession; and the others were permitted to make themselves scarce as quickly as might be—a licence they promptly availed themselves of.

I have but a few words to add. Henry Ransome died, I heard, not long afterwards, of pulmonary consumption, brought on by the abuse of alcoholic liquors, and his wife and daughter ultimately got into respectable service. Mary Ransome married in due time, and with better discretion than her mother, for she does, or did, keep one of the branch post-offices in Bermondsey. Dr Lee disappeared from the neighbourhood the instant the state of his leg enabled him to do so, and I have never seen him since. John Wyatt, *alias* Black Jack, was transported for life, under the *alias* of John Martin, for a highway robbery near Fareham, in the year 1827. Lately I saw him on board the convict hulk at Portsmouth.

AIR-TRAVELLING.

It may be generally known, that for some time extraordinary efforts have been making to discover a method by which locomotion through the air may be rendered as certain and practicable as locomotion by sea or land. In this desperate enterprise, of bringing the principle of aërostation into regular use, certain individuals in Paris have taken the lead. Our belief, like that of others, is, that plans of this kind will fail, as they have hitherto done; at the same time, we think it would be improper to dogmatise on the subject, and will only say, that if travelling by balloon becomes one of the established things of the day, so much the better.

With these feelings, we have thought it consistent with our duty as journalists, not to refuse publicity to an account of what was till lately doing in Paris to forward practical aërostation—we say, lately; for we are told by our correspondent, that the operations towards perfecting the invention have been stopped by orders of the French government, from an opinion that, if air-travelling were introduced, it would be injurious to the custom-house, and denationalise the country. This resolution of the French government is to be regretted, not less on the score of science, than from the ruin it has inflicted on the modest means of the ingenious operator. With these preliminary explanations, we offer the following paper, just as handed to us by a respectable party conversant with the details to which he refers.

'The chief difficulty in aëro-locomotion, is that of steering; because the atmosphere seems to present no substantial fulcrum which can be pushed against. But that this difficulty is not altogether insurmountable, is evident from the single fact, that birds really do steer their way through the air. This fact suggests, that a fulcrum is not necessarily a palpable substance: it may be pliant or movable. For instance, if we fasten

the string of a kite to a ball, this ball, which represents the fulcrum, being set in motion by the kite, becomes a movable fulcrum: a child also, holding the string in his hand, runs from right to left without impeding the motion of the kite, of which motion he is the movable fulcrum. Absolute stability, therefore, is not a necessary condition of a fulcrum; it is sufficient that there be, between the resistant force and the motive force, a difference of intensity in favour of the former. Thus, in water, the fulcrum, being liquid, is necessarily pliant and movable; yet it is quite possible, as every child knows, to obtain in this element purchase sufficient to steer the largest ships.

'In the air, which is a gas, the fulcrum being gaseous, must also be movable; but although the air, being the most elastic body with which we are acquainted, is therefore the least apt to furnish a fulcrum, yet, as compressed air is capable of bursting the strongest metallic receptacles, splitting the solid rock, and rending the bosom of the earth, it would seem that we have only to act upon the air through pressure, in order to obtain the requisite purchase from which to steer.

'Foremost among those who are thus endeavouring to render the balloon manageable, is M. Pétin of Paris, who has devoted fifteen years to the study of this subject, the last three years to lecturing upon it in the principal towns of France, and who has unfortunately expended the whole of his resources in constructing an air-ship intended to demonstrate, on a small scale, the possibility of steering according to the system which he has elucidated. We say on a small scale; for though the dimensions of the curious construction in question, intended to carry two hundred passengers, will appear large to those of our readers whose ideas of ballooning have never gone beyond the ordinary ascensions so much in vogue at the present day, they are yet of almost microscopic minuteness when compared with the developments of which M. Pétin and his friends conceive his plans to be susceptible!

'The body of this novel vessel consists of two covered decks, or galleries, connected by a series of narrow bridges, thrown across the open space between them, on a level with their floor; thus forming the body of the vessel, which looks not unlike a couple of Noah's Arks, placed parallel to each other, and connected by means of the aforesaid bridges. Suspended across the upper part of this open space, is a row of sixteen movable wings, placed one behind the other, and attached, by means of pivots, to the upper edge of the inner walls of the galleries; these wings are of oiled sail-cloth, set into oblong iron frames, and are worked by machinery. They may be opened or closed, inclined to or from each other, at any angle, upwards or downwards. At each end of the vessel, near the stem and the stern, is a pair of screws, similar to the propellers of a steam-ship, and worked by a couple of small steam-engines of three horse-power each, one being placed just above and behind each pair of screws. Lastly, attached to masts projecting horizontally from each end of the ship, are a couple of triangular or lateen sails; smaller sails are also attached to the under part of the balloons, which, enclosed in net-work of strong cord, are fastened to the roof of the galleries, directly over the wings, beneath which, again, are the bridges from which the crew are to work the ship.

'These skeleton galleries, which, with the exception of the floors, and the walls and roof of their central portion, are constructed of lattice-work, faced with thin

bands of iron, in order to render the whole as light as possible, are 162 feet in length, 8 feet in height by 4 feet in width in their central portion, but taper off to 18 inches in height and width at their extremities. This mode of building gives an oval form to the framework of the vessel. The central portion of the galleries, which is at the same time the highest and the widest, embraces a length of 66 feet, and is appropriated to the passengers. The boilers are placed here also, one in each gallery; the steam being conveyed to the engines by pipes.

'The total length of the ship, including that of the two projecting masts, is 198 feet; and its total weight, including that of the machinery, and a crew of eight men, is 14,000 pounds. The balloons are 66 feet in diameter, and will contain 15,000 cubic yards of gas. Their ascensional force is 20,000 pounds. The wings are 6 feet in length by 15 in width. The screws are made of pitched canvas, rimmed with iron; they are 6 feet in length.

'The eight central wings, disposed in the form of an upright roof—*parachute*—or of an inverted roof—*paramont*—are intended, by pressing on the air above in ascending, and on the air below in descending, to furnish the necessary point of resistance, or fulcrum, from which to steer. The other eight wings, four at each end of the central group, are intended, by being opened or shut, to act as a counterpoise; thus producing a rupture of equilibrium around the central fulcrum, and thereby changing the upward movement of the balloons into an oblique forward movement. In other words, the ship being raised into the air—to the stratum immediately above the region of storms—and maintained there by the ascensional force of the balloons, and being forced onward by the screws, the four anterior wings are to be opened, the four posterior ones remaining closed. The forepart of the ship being now relieved from the downward pressure of the air, caused by the upward movement of the balloons, this pressure still acting on the posterior wings, its equilibrium is destroyed; the forepart rises, the hindpart dips, thus changing the direction of the ship's course, by converting its vertical into an oblique movement, which is to carry it onward upon a plane inclined slightly upward.

'This operation is to be followed by its converse. The four posterior wings are to be opened, and the four anterior ones closed; the vessel now dips in the opposite direction, and moves forward on a plane inclined slightly downward; and so on. Thus, by alternately opening and shutting the two sets of lateral wings, M. Pétin proposes to make his ship sail forward on a series of inclined planes, upwards and downwards. He takes care to assure us, however, that the requisite degree of inclination will be so slight as to be imperceptible to his passengers; and instances, in corroboration of this opinion, the beds of rivers, where a very slight degree of inclination suffices to produce a rapid current.

'In order to determine perpendicular movement, the central wings—which, according to M. Pétin, when placed in an oblique position, will constitute the fulcrum—are to be brought into an upright position, thus offering no resistance to the air; the two pairs of screws are then made to turn in opposite directions with great velocity, forcing powerful convergent currents of air upon the two sets of lateral wings, maintained in oblique and opposite positions. The force of these currents, being decomposed by the resistance of the wings, is thus changed into a perpendicular pressure, acting upwards or downwards according to the position of the wings; by means of which the aeronaut hopes to be enabled to ascend or descend without losing either gas or ballast.

'This decomposition of the force of the currents produced by the screws, is analogous to that effected by the sails of a ship sailing across the wind; where,

the sails being inclined at an angle of 45 degrees to the course of the wind, the ship is impelled onwards in a direction at right angles to that of the wind: the only difference in the two cases being this—namely, that in the sails of the ship, the axis of inclination, represented by the mast, is *vertical*, creating *horizontal* movement; while, in the wings of the air-ship, the axis of inclination—the pivot on which they turn—is *horizontal*, creating *vertical* movement. Were there but one pair of screws, acting upon one set of inclined wings, a slight retrograde horizontal movement would be produced in addition to the vertical movement, as the current of blast from the screw would react upon the screw itself with a force greater than that with which it would impinge upon the wings, where a part of the blast will inevitably be wasted. But there being two pairs of screws, acting in opposite directions, they will neutralise each other's horizontal movement, while combining in the production of vertical movement. So, at least, reasons our inventor; but however ingenious this expedient, its efficiency may well be doubted, when we remember the immense amount of resistance, offered by the surface of the balloons, which would have to be overcome.

'To obtain lateral movement, the action of one pair of screws is suspended, leaving the other pair in motion: the ship, according to the calculation of M. Pétin, will immediately describe a curve, and turn.

'Such is the air-ship constructed by M. Pétin; but, unhappily for the demonstration of his views, the French government, either from fear of accident, or from some other motive, has interdicted its ascension; and the vessel which, three months ago, was ready—crew, captain, and machinery—to attempt its advertised flight round the walls of Paris, is still reposing, in inglorious idleness, upon its stocks in the Chantier Marbeuf (Champs Elysées), to the woful disappointment of its enthusiastic inventor, who, however, consoles himself with the hope of coming over to London for the purpose of testing his invention, as soon as the return of fine weather shall render it prudent to make the trial journey. In justice to M. Pétin, we would observe, that the sole point which he hopes to prove with this vessel is, *the possibility of obtaining a fulcrum in the air*, justly considering that if the question of *steering* were affirmatively settled, the necessary means, pecuniary and other, would soon be forthcoming to enable him to improve upon, or to change the original construction, and to build the mammoth vessels, containing closed apartments, warmed and fitted up with every provision for comfort, in which he hopes to transport several thousands of passengers at a time, and at a speed which it almost takes away one's breath to think of.

'For, urges M. Pétin, if we could once succeed in getting a fulcrum in the air in spite of its elasticity, this very elasticity would then enable us, with suitable motive-power, to move with a degree of rapidity far transcending the possibilities of locomotion in any other element. In fact, it would seem, according to M. Pétin's computations, that we might breakfast in London, lunch in Constantinople, dine in China, dance the evening out in Havannah, and get home to bed at an hour not much later than that at which the votaries of fashion usually betake themselves to their slumbers.

'The reasoning by which our inventor arrives at the seemingly paradoxical conclusion, that the air is destined to be the high-road *par excellence*, and to serve as the medium of transportation for the heaviest loads, is certainly very ingenious; of its conclusiveness, we must leave our readers to judge for themselves.

'Progression from the simple to the composite, says M. Pétin, is the universal law. In the works of nature, the action of this law is everywhere visible; and man, in his works, follows the path thus consecrated by the footsteps of the Creator. Thus we find, he continues,

that the point multiplied by itself produces the line; the line, in like manner, produces the plane; and the plane, the cube; an ascending series, which he conceives to have its exact analogy in that furnished by the earth, the water, and the air, considered as *media* of locomotion. In other words, the point, or primary germ of extension, corresponds, according to the theory of M. Pétin, with the fulcrum, or primary condition of locomotion; the line, first and simplest form of extension, corresponds with locomotion on the surface of the earth, where, owing to topographic inequalities, and other obstacles, locomotion can take place only in its first and simplest mode—namely, in a linear direction; the plane, produced by the movement of the line, and constituting a higher term of superficial development, corresponds with locomotion upon the water, whose unencumbered surface, which can be traversed in every direction, presents a locomotive medium, the facilities of which, compared with those offered by the surface of the earth, increase in the ratio of the difference of extension between the line and the plane.

'The cube, product of the plane multiplied by itself, corresponds with locomotion in the air, where the *aéronaut*, being surrounded on every side by fulcra furnished by the various strata of the atmosphere, moves at will in every direction; pressing on the higher strata in ascending, on the lower in descending, on the lateral in turning to the right or to the left, and thus commanding a sphere of locomotion whose extent and facilities, compared with those afforded by the water, are as the cube to the plane.

'Aërial navigation being thus, according to his theory, the highest form of locomotion, M. Pétin considers himself as justified in assuming, *a priori*, that this mode of transportation will offer facilities superior to those of every other in point of safety, speed, power, and cheapness; but on condition of its being carried into effect upon a scale commensurate with the vastness of its field and the importance of its results.

'To convince ourselves that such is really the intention of Providence, and that balloons are destined to transport the heaviest loads, we have only, continues M. Pétin, to examine the law which presides over the development of spheric bodies; the surface of a sphere being represented by the square of the radius, while its *contenance*, or containing power, is represented by the cube of the radius. In other words, if we increase the diameter of a sphere three times, although we increase its surface only nine times, we increase its containing power twenty-seven times. Therefore, by constructing balloons on a very large scale, as the extent of surface, and consequent resistance of the air, increases in an immensely smaller proportion than the containing power, we may obtain an almost fabulous amount of ascensional force. For instance: a balloon of one hundred yards in diameter would suffice to raise only ten millions of pounds; but ten such balloons ranged one behind the other, or, better still, a cigar-shaped balloon, which would be equivalent to these ten balloons united in one (an arrangement which, as the law of development is similar for spheric and for cylindric bodies, would greatly diminish the resistance of the air, without occasioning any loss of containing power), would suffice to raise one hundred millions of pounds; and allowing some four or five millions of pounds for the weight of the vessel and its machinery, which, for a ship of this size—supposing it were possible to make its various parts hold together—should be, M. Pétin computes, of twelve hundred horsepower, we should still have at command a surplus ascensional force of upwards of ninety millions of pounds; a force sufficient to sustain a body of fifty thousand men!

'In the construction of these enormous balloons,

M. Pétin proposes to substitute, in place of the silken bag hitherto used to contain the gas, a rigid envelope of a cylindro-conical form, composed of a series of metallic tubes, laid one above the other, and supplied with gas—obtainable to any amount and almost instantaneously—from the decomposition of water by a powerful electric battery; and with these resources at command, M. Pétin conceives that balloons might be constructed on a scale even larger than that just given!

'In fact, this assumption of the possibility of obtaining command of an unlimited ascensional force has suggested, to certain enthusiastic partisans of M. Pétin's theory and plans, a long perspective of astounding visions, from which sober-minded Englishmen would, in all probability, turn away with derision. These enthusiasts have evidently adopted the language of Archimedes, and are ready to exclaim: "Give us a *fulcrum*, and," with hydrogen gas as our lever, "we will move the world!"

'For ourselves, we have already stated the facts from which we derive our conviction that the conquest of the air, if achieved, is to be brought about through the agency of new and powerful mechanical combinations, rather than by means of the balloon; and though, as before remarked, the experiments of M. Pétin and others may probably not be without useful results, we dismiss these brilliant phantasmagoria with the charitable reflection, that the extravagance of overweening hopefulness is, at least in an age which has witnessed the advent of steam and electricity, more natural and more pardonable than the scepticism of confirmed despondency; and that "he who shoots at the stars," though missing his aim, will at all events shoot higher than he who aims at the mud beneath his feet.

'Meantime, the science of meteorology—a subject intimately connected with that of *aéro-locomotion*—though yet in its infancy, already furnishes many indications of great importance, as establishing a very strong presumption in favour of the existence of permanent atmospheric currents, blowing continuously in various directions at different degrees of elevation.

'We know that air, when rarefied by heat, becomes lighter and rises, cold air immediately rushing in to supply its place; and it is evident, therefore, that if two neighbouring regions of the atmosphere are unequally heated, this inequality of temperature will give rise to two currents of air—a warm one, in the upper region of the atmosphere, blowing from the warmer to the colder region; and a cold one, near the surface of the earth, blowing from the colder to the warmer region. It can, therefore, hardly be matter of doubt, that great permanent currents, caused by the unequal heating of the equatorial and polar regions, do exist in the higher strata of the atmosphere—an inference which is supported not only by the occurrence of the trade-winds and the monsoon, but by a variety of other facts and observations.

'Thus, for instance, it is found that in the region of the trade-winds, cinders from the craters of volcanoes, and other objects, are carried through the higher regions of the air in a direction exactly opposite to that in which the trade-wind itself is blowing below; and in this way cinders from the Cosiguina, in Guatemala, frequently fall in the streets of Kingston (Jamaica), lying to the north-east of Guatemala. Similar facts have been observed at the Peak of Teneriffe, in the Straits of Magellan, and elsewhere.

'The importance of this subject with regard to *aéro-locomotion* can hardly be overrated; for these currents, when clearly ascertained and correctly mapped out, would constitute so many great natural routes, where the aeronaut would be borne onward in the required direction with immense velocity, and without danger of encountering squalls or counter-currents.

'But here, fearful of exhausting the patience of our

readers, we bring our somewhat lengthened disquisitions to a close, and take our leave for the present of the tempting, though debatable ground of the CUBIC HIGHWAY.'

A MEMOIR FOR THE MILLION.

ON the meeting-line between a moorland and lowland district of Perthshire, stands an old baronial seat, dignified with the name of castle, to which, no doubt, it was entitled long after the date of its erection, in the fifteenth century, although no longer boasting of either the strength or magnificence which such a name implies. Its position, however, is picturesque—standing on the bank of a romantic and finely-wooded Highland glen, and commanding a view on one side of a mountain-range, and on the other of a cultivated country, with its towns and villages in the distance. The mansion is flanked on one side by a court-yard and 'louping-on-stane;' and on the other, by a velvety bowling-green, stretching along to an antique garden of cut yews and hollies overhanging the glen. It boasts, of course, its haunted chamber, and traditional stories of love and murder; but we have not now to do with life or death above stairs, though many a tale might be founded on truths 'stranger than fiction.' Our present purpose is with the neighbourhood of the kitchen. There, too, we find some relics of olden times; a fireplace which would legalise the Scottish invitation, to 'come in to the fire,' inasmuch as within the chimney-arch was the seat of honour and comfort, where a dozen cronies could sit beside the embers, while an ox might roast in front. From that cozy nook did the old fiddler play in the evening, when the spinning-wheels were put away, and the maids, generally tenants' daughters, had their dance with the stragglers from the stables and cottages. Near the kitchen was a much colder and more dismal place, that went by the name of 'the Pit'—a half-subterranean recess, several steps lower than the kitchen, into which scarcely a ray of light penetrated through the small 'bole' that was drilled in the massive walls for a window. The cheerless aspect of the place seemed to confirm the tradition, that it had sometimes served of yore as a place of involuntary restraint. Its present occupant, however, the son of a day-labourer, found no fault with the accommodation it afforded him. He was a young boy, who cleaned shoes, scoured knives, and received with great deference the commands of Daniel Don, the butler. This boy was called John Dickson. The Pit was his domicile, as well as his work-room, and he made it also a 'study;' for having earned a rushlight by running messages, or doing extra work for his neighbours, he might be found at night, as long as the light would last, poring over a book. In this way he had, unknown to others, while still a mere boy, read through that vast quarry of erudition, Henry's 'Commentary on the Bible.'

Old James, the gardener, was a tolerable scholar, and a well-informed man, and took great pleasure in encouraging young students; so, on discovering John Dickson's taste for books, he lent him an old Latin grammar, recommending him to commit it to memory. This John did with praiseworthy diligence, although, being written in a language he did not understand, he could make but little use of his acquisition. Old James, however, may be forgiven for having set John to study after the orthodox fashion of Ruddiman, for he had never been out of his own glen, and in those days

new ideas were long in penetrating to the country districts.

When John Dickson was promoted to assist in waiting at table, an incident occurred, which no doubt had some influence on his dreams, if not on his fortunes. A stranger, in regimentals, was at dinner one day, and being prepossessed by the lad's pleasing manners and expression of face, he turned to him, and clapping him on the shoulder, said: 'I was once in your present station, my boy, and if you are steady, and behave well, you may one day rise to be in mine.' The speaker was Dr Miller, a physician in the army. John, however, had few dreams and little ambition. He was not what is commonly called a genius; but he possessed sterling qualities of head and heart, perseveringly cultivated his natural abilities, and invariably conducted himself with the greatest propriety. It was no wonder, then, that he became a general favourite in the family; and that, when he carried the game-bag for the gentlemen, they purposely made long detours, and met him again at an appointed spot, in order to give him an hour at his book; for John always had a book in his pocket for a spare moment. Once, indeed, this custom occasioned some annoyance to his master, whom he had accompanied to a shooting-hut in the moors, nicknamed 'Grouse Hall,' where the unfortunate laird was detained by an intolerable fit of gout; a circumstance not apt to engender patience and resignation, especially when, from the other side of the cloth partition which divided the single apartment of the hut, he heard bursts of laughter pealing forth in succession—for John Dickson had managed to carry off a copy of Don Quixote to the moors.

When the younger sons of the family were sent to college in Edinburgh, John was chosen to accompany them. Let us now see how he conducted himself in this new and trying field; for trying it is. Country lads, in coming to a large town, meet with many temptations, and by these, hundreds of them fall. They cannot resist petty attractions to amusement and mispending of time. They enjoy themselves while they should work. They take to fun, instead of to labour. Well; to which did our hero attach himself? To regular, hard work, to be sure. He had the good sense to see, that here was his chance of getting on in the world. While other lads were amusing themselves at the theatre, or kicking their heels about the street, or hanging about the auction-rooms in front of the college, John Dickson stuck hard to his books. He also availed himself of other advantages connected with his situation. The tutor of the family in which he was employed was John Barclay, afterwards the celebrated anatomist, whose valuable museum was bequeathed to the Royal College of Surgeons of Edinburgh, on condition that they would build a hall, and form a more extended collection, which has been fulfilled. At this time, Dr Barclay had commenced his private lectures on anatomy, which soon became popular; and John made himself so useful in the arrangement of the classroom, that the doctor was induced to encourage him to attend the lectures, and assist in preparing the demonstrations. Thus Dickson spent many winters, at once attendant and pupil, returning to the country in summer in his old capacity. By degrees, he completed his medical education, obtaining gratis-tickets from the professors—a favour sometimes extended to deserving students, and of which he was well worthy. Dr Barclay once gave a good lesson to those who apply for such gratuitous favours for others. He was asked by a certain bookseller to give a perpetual gratis-ticket for his class to a student then standing in the shop, who could ill afford to pay the four-guinea fee. 'Most certainly,' said the doctor; 'I can never refuse in such a case. By the by, Mr —, I want a few books; will you

look them out for me now?' and the doctor enumerated several standard medical works, which were produced with great alacrity. He then selected four guineas' worth from among them, and handed them over to the astonished student, along with a lecture-ticket, saying: 'Of course, Mr — intended giving you the same value in books which I do in this ticket!' The bookseller, although a notoriously parsimonious character, had not a word to say. Dr Barclay took great pride in collecting a library, and invented the following device as a mark for his books: His initials were engraved in the centre of an oval, at the top was the sun, with the motto—'I weary not;' below, was a mountain, with 'I am firm;' and surrounding all, 'Excel if you can.'

These graphic mottos became the guiding-stars of John Dickson's career: he wearied not, nor wavered in whatever pursuit he engaged; and it was to this indomitable industry that he owed his success in life. His perseverance was displayed even in his amusements; he was fond of music, but had not a sufficiently correct ear to play the violin well, yet he would not abandon it, but scraped away year after year, in hopes of ultimate success, although in this instance without attaining his object. In more important pursuits, his industry was amply rewarded; and having taken his degree, we must now call the heretofore denizen of the Pit, Dr Dickson, and record, that the students of the university, on his leaving Edinburgh, presented him with a testimonial, to signify their appreciation of his valuable demonstrations in the class of Practical Anatomy. Some of his preparations may still be seen in the Museum of the College of Surgeons.

An appointment as assistant-surgeon in the navy was now procured for him; medical officers being then in greater request than they are in these piping times of peace. With affectionate regret, and not unmanly tears, he left the home that had sheltered him for so many and such important years of his life, and towards which he ever evinced the warmest attachment. His gratitude was not long in shewing itself practically. In a few years, he returned from abroad; and on landing in Britain, heard that the son of his former benefactor, with whom he had been on the most intimate terms, was desirous of leaving the army, and entering into partnership with some medical man in England, for which a considerable sum of money was necessary. Dr Dickson knew full well that there might be some difficulty in advancing the required amount to the youngest of a family of fourteen; so he addressed a beautiful and touching letter to him—saying, 'that he had already, out of the savings of his pay and prize-money, bought an annuity for his old mother, and had no one else to provide for. To you,' continued he, 'who always shared your jelly-pieces with me, when we were boys, I owe a debt of gratitude, and to your family, one which I can never repay. I trust you will not now refuse to share my earnings, but frankly accept of L.800, to assist you in settling in life.' This noble offer was, from motives as noble, declined, as well as the same sum, which Dickson now pressed upon his friend, as a loan; but an affectionate correspondence was kept up between them until Dr Dickson's death, more than thirty years afterwards.

In 1814, Dr Dickson visited Scotland, and was received as a beloved and honoured guest at the table where, long ago, he had waited as a servant, and where had sat the stranger gentleman in regimentals, who clapped him on the shoulder, and spoke to him words of encouragement which perhaps had sunk deeper into his mind than he was conscious of himself. His native politeness had always been remarkable, and now his general information and agreeable manners made his society a true acquisition. After a few months' visit, he left Scotland never to return. Again he went

abroad, and finally settled at Tripoli, the African port on the Mediterranean, under the Turkish dominion. Here the sultan's viceroy, the pacha, soon appointed Dr Dickson to be his chief physician—a post which he held for thirty years under various successive pachas, although the rival claimants for vice-regal authority sometimes fought so fiercely, that the English residents were glad to seek shelter in Malta, until it was decided who should reign. Still, Dr Dickson never lost his office, which has now descended to his son; an extraordinary instance of permanent favour under so arbitrary a government. Dr Dickson had married a Scottish lady, and being now settled in every way, his life, so far as we know, affords no farther incidents necessary to record. It was a career, however, of continued usefulness and benevolence, and, surrounded by a promising family, who revered their father, we believe he enjoyed as much happiness as usually falls to the lot of humanity.

One only drawback there was to the favour in which he stood with the pacha: the doctor was obliged, when attending the high ladies of the court, to drink in their presence one-half of every drug he prescribed—a custom it might not be amiss to introduce into England, although not with the view, as in Tripoli, of guarding against poison! Dr Dickson also acted as consul for Portugal, although for many years he received no salary: at last, on paying a flying visit to London, two years before his death, he was recommended to go home by Lisbon to seek redress. He found, however, that amid the clash of political factions, justice was difficult to be found, and so he gave up both the search and the post.

The estimation in which Dr Dickson was held at Tripoli, both by the English residents and native population, cannot be better described than by quoting entire a paragraph from a London newspaper, which inserted a notice of his death in the year 1847: 'Letters from Tripoli, just received, announce the death, on the 27th February, after only four days' illness, of Dr John Dickson, a half-pay surgeon of the British navy, who had been upwards of thirty years a resident at Tripoli, and where, such was the extent of his gratuitous attendance on the indigent, that the mournful event cannot but be looked upon as a great public calamity; and happening as it did, at the very instant the first gun announced the anniversary of the birth of the Prophet, not a few of the Mohammedans regarded the event with a superstitious awe. On the 1st of March, the remains of the lamented deceased were interred in the Protestant cemetery, which is distant about two miles from the town, escorted by a military guard of honour, sent by order of his Excellency the Pacha, and followed not only by every foreign consul, but by all the European residents of every class, and by several thousands of Jews and Mohammedans; and so anxious were many whom he had attended professionally to pay this last tribute of respect to his memory, that they actually rose from their beds of sickness and joined the mournful procession. Whilst it passed along the crowded streets, the shrieks and cries of the natives bewailing his death were audible, issuing from the miserable hovels which he had been wont to enter, to prescribe for suffering humanity.'

After this, it is needless to add anything in the way of exhortation. The little history here given is full of encouragement. It is that of a man who raised himself from humble life, not, it is true, to any dazzling eminence, but to a respectable and respected position in society; and this not by means of rare talent, but simply by industry, perseverance, and general propriety of conduct. The interest of the piece, we believe, would have been much lessened, had we, through false delicacy, withheld the real name of the individual. It is happily not the fashion in our day for self-educated and self-raised men to blush for their

origin; and we are quite sure that every word of this narrative will be read both with pride and pleasure by the flourishing and widely-scattered family of Dr John Dickson.

A DAY AT THE BATHS OF LUCCA.

THE baths of Lucca, ever since the opening of the continent, have been graced annually by the presence of from four to five hundred English, who shew their good taste in selecting this miniature Switzerland for their residence during the summer months. It is, in truth, a lovely valley, with its thickly-wooded hills, and shady lanes, and murmuring river; while the irregularity of the villages, or clusters of houses where travellers are generally lodged, give variety and interest to the landscape.

The first of these groups of buildings is the Ponte a Serraglio. Here are the principal hotels; the post-office; the English reading-room and club; the Casino; a few small shops dignified by such names as 'Magazine of Novelties,' and 'The Real Bazaar;' and a caffè; where congregate all the idlers of the community.

About a mile further on, attainable by a pretty road, winding at the foot of a mountain bordered by acacia trees, and overhanging the river Serchio, is situated the Villa—another range of tenements, the inhabitants of which arrogate to themselves greater staidness of demeanour than their brethren at the Ponte, thinking, perhaps, that the vicinity of the English chapel—a handsome structure, in the style of an ancient Venetian palace—may vindicate this assumption of decorum. There is but one hotel at the Villa—calm, dignified, and frigid; the remainder of a long rambling street of which the place is composed, consists entirely of lodging-houses, having gardens attached to each, where little children may be seen playing at the doors, and English nurse-maids pursuing their laborious avocations. This preponderance of small children at the Villa, is as much its characteristic distinction, as whatever relates to gaiety, or novelty, or scandal, may be considered the peculiar attribute of the Ponte.

A distinct race inhabit the Bagni alla Villa—a group of houses inaccessible to carriages, rising on a hill behind the palace belonging to the ex-duke of Lucca. A fourth division of dwellings is the Bagni Caldi, the highest point of all, the occupants whereof have to descend as if from an eyrie, to gain any of the other localities. They are a set of whom little seems to be known—quaint and unsocial personages, venturing out at dusk like bats and owls, and looking grimly on all but their immediate neighbours: the gentlemen, mostly gouty, or otherwise disabled; the fairer sex, isolated and ancient, with a marked predilection for close straw-bonnets, large brown parasols, and blue veils.

Thus much for the first outline of the place and its frequenters. We must now take a glance at their pursuits and enjoyments.

The general tenor of a day at the baths is easily described. Till about five in the afternoon but few people venture out, although early in the morning it is said that some, more active than the rest, sallied forth on their mountain rambles; but this deponent vouches not for their number or degree, never himself having had ocular demonstration of their movements. During the heat of the day, the greater part remain at home, excepting, indeed, the population of the Ponte, who, exulting in all the advantages their position unites,

circulate from the post-office to the caffè, from the caffè to the club, and condole with such of the hapless denizens of the Villa and Bagni Caldi as a thirst for news and devouring ennui have driven to brave a hot summer walk to their more favoured region.

There is always, even at noon, a buzz of animation in the little piazza of the Ponte—always a knot of worthies in loose brown holland coats and straw-hats, talking over every passing occurrence. The banker's office, too, is situated here, and that is a lounge in itself—a sort of private committee-room for the discussing of any fresh piece of gossip, ere it is submitted for dissection to the public at large. The English banker has now become an important feature in all continental circles. The unsophisticated beings who, perchance, imagine his duties simply limited to cashing travellers' bills, and discounting circular-notes, have now an opportunity of learning over how wide a field of action his arduous avocations must be spread. The English banker should be imperturbably good-tempered, active, and obliging; allowing no difficulties to dismay, no ungraciousness to offend him. His clients' happiness, interest, comfort, and amusement are his engrossing thought; and if, after experiencing an infinity of trouble, rudeness, and vexation, his only return should be the half-percentage on a L.50 draft, he is expected to smile, be contented, and with undaunted resolution, pursue the same train of kindness and civility towards the next new-comer. The banker's wife has also her line of tactics to pursue. She must call on all the influential families who bring letters of recommendation to her husband; listen with interest to all the detailed miseries of travelling with young children; and be sympathisingly anxious about little hopeful's eyeteeth. She must be an adept at writing notes, and be possessed of an immense store of local information to supply the incessant inquiries with which she is assailed. She must also give tea-parties and dances, get partners for all the disengaged young ladies, and stand up herself, if necessary, to complete the quadrille. Finally, she must be above feeling any affront or mortification, and learn to consider herself in the light in which she is commonly regarded—a sort of machine pertaining to the bank: just as much a part of the establishment, in fact, as the iron money-chest which stands in the office, and created solely for the advantage and convenience of her travelling country-people.

When the continental banker happens to have no wife, in his own person must be united the attributes I have described; and with a beaming face, and frank shake of the hand, must he advance from his desk to greet every visitor who breaks in upon his hours of business. Let us take a peep, for instance, one July morning, into the bank.

Two or three old *habitués* are reading the newspapers; before them is a table on which are army and navy lists; notices of the arrivals and departures of the French and Peninsular Steam-Navigation Company's packets from Leghorn; itineraries of the baths; cards of professors of various languages, &c. The banker is writing. Enter a lady; a boy, with turn-down collar and very red ears; a little girl in a nice hat; a Swiss *bonne*; and a baby, with a blue sash and feather.

Banker. (Advancing cordially.) Ah, Mrs Worryemwell, how do you do? (*Pats the boy on the head.*) And how are you, my fine fellow? (*Gives the baby an amicable poke in the ribs, whereat it laughs and crows uproariously.*) Take a seat on the sofa, will you, Mrs Worryemwell; and now, tell me, when did you leave Florence?

Mrs Worryemwell. The day before yesterday. We should have been here sooner, but we missed the train for Lucca, because one of the trunks was left behind at the Pisa station, and I would not move till it was found.

Banker. (Anxiously.) But you recovered it, I trust?

Mrs W. Yes; but we are in sad trouble now: a canister of arrow-root must have remained on the Lucca Railway, and baby will get ill without it. We had a good many small packages, and this one was overlooked in the confusion; but—

Banker. (Promptly.) I'll write to the clerk in charge at the station about it at once.

Mrs W. Oh! thank you. I was going to ask you to do so. A brown, japanned canister, fastened down with some strong twine.

Banker. Very good, very good. How do you like your house at the Villa? I gave orders that the beds should be aired, and charcoal and oil provided before your arrival, just as you directed.

Mrs W. Thank you; pretty well; but, as usual with all Italians, the owners are most disobliging. I wanted a cot put in for baby, but they say they have none, and that it was not stipulated for in the agreement. Now, surely (*impressively*), surely a person of your experience would never take a house for a lady and young children without such an indispensable thing as a cot?

Banker. You did not mention it in your letter, my good lady, and having four other friends' lodgings to fix that same day, it has, I fear, escaped me. (*Good-humouredly.*) But we'll try and arrange matters. I'll come down and talk to the *Padrone di Casa*—

Mrs W. (Taking a memorandum out of her reticule.) Let me see. Ah, yes! butter, milk, eggs. Could you favour me with the exact prices of all these necessities? for I am certain the people of the house have cheated in what they have procured for us.

Banker. Certainly. One of my clerks shall procure you every information.

Mrs W. Ah, yes! and if you will come this afternoon to the Villa, you can also insist on their white-washing my English servant's room. It overlooks the garden, and a scorpion was found on the window this morning. Now, white-washing the walls is the only safeguard; it would really annoy me if he were stung.

Banker. I will see about that too. Ahem! I must write at once about the arrow-root, or the post will have left. Can I supply you with any money?

Mrs W. You are very kind. I must think—(*putting her hand to her head*)—a few more things I wished to ask. Do you remember them, Freddy dear?

Boy. (Husily, and blushing.) Club, church, pony.

Mrs W. Very right, love. What is the subscription to the club and reading-room?

Banker. Three napoleons for the season.

Mrs W. Will you enter my name? They give parties there sometimes, I believe. Ah, then the church! how much is that?

Banker. Three sittings for you and your two children will not amount to quite so much as the club.

Mrs W. Of course not. But even so it is a bad system. The church ought not to be made a medium of traffic—paying for church-seats always gives me a headache. I think, do you know, two sittings will be sufficient; yes, put me down for two. I will take Freddy in the morning, and his sister in the afternoon. That is all, I believe.

Boy. (In an agitated manner, whispers) Pony!

Mrs W. Ah, true, dear! Can you recommend me where to hire a pony for my boy?

Banker. To be sure I can. (*Giving a card.*) Here are the address and terms of a man who lets them out either by the day or month. Ahem!—would you like the money in gold or dollars?

Mrs W. I am much obliged. On one other subject perhaps you could assist me. There really seems no

one worth knowing here at present, except a family who always reside at the baths, and often receive, and have written a book, and are quite celebrated. I should like—

Banker. (Hurriedly.) Really, that I fear I cannot manage for you. The arrow-root—

Mrs W. (Rising.) Oh, very well. It is late, I am afraid. I need not trouble you to-day for money, I believe. I brought sufficient from Florence for the present; we will wait till the exchange is more favourable.

Banker. (Heartily.) No matter; you can have it whenever you please. I shall come this afternoon and put all in order for you.

Mrs W. Thank you. Good-morning. (*Shakes hands, and exit.*)

In this manner, and through similar interruptions, much of the banker's time is taken up, till near three o'clock, which is the general dinner-hour at the baths. Many people are supplied with this renovating meal from the Europa Hotel at the Ponte, which is presided over by one of the most honest, obliging, indefatigable, and enterprising landlords in existence. Not only has he the direction of three hotels at the Ponte, two of them off-shoots from the parent Europa, but he undertakes the herculean task of daily sending forth thirty-six dinners to different families; the whole requiring a combination of artistic resource and fertility of intellect that fully justifies his right to the appellation bestowed on him by the ex-duke—that of 'the Napoleon of inn-keepers.' These repasts are conveyed in large tin boxes, containing warm embers, on which are placed the various dishes of which the dinner is composed; and they are carried to their destinations on the heads of divers active, nimble-footed *marmittons*. As the hour of three approaches, numbers of these emissaries are seen gliding swiftly along the roads; and I never yet encountered one without comparing him to the slave who appeared at the bidding of the Genius of the Lamp, and bore a sumptuous banquet to the presence of Aladin.

After thus recruiting the inward man, the whole population of the baths seem suddenly to kindle into activity; and soon after five every one is astrir. Some ride, some drive, some walk. You see every variety of conveyance, from the last London-built carriage, and livery servants, to an unpretending one-horse *timonella*; and in the same manner amongst the equestrians, the most ill-favoured little pony, its rider equipped in a straw-bonnet, with a shawl pinned across the saddle, will unblushingly thrust itself into companionship with a handsome English horse, whose owner is graced by the most unexceptionable habit and other appliances. Even the very donkeys walk along with dignified resolution, as if determined to ruffle it with the best, and not yield an inch of their prerogative. In fact, they evidently know their own value, and remember that not one of the hills around—not the giant tree on the heights of Lugliano, nor the tempting strawberry-gardens on the mountain of Benabbio—could be attained without their help. A few veteran ponies, it is true, now claim equal sureness of foot, but the popular feeling still leans towards the long-eared auxiliaries, who always lead the way on such excursions, displaying an accuracy of judgment which would not discredit their far-famed relations in the frightful passes of the Andes.

Thus the evening wears on; gradually the children and babies disappear from the scene; then follow the invalids, who had ventured out to sun themselves in the genial afternoon; and soon parties of riders are seen returning, their laughter and cheerful voices sounding pleasantly on the ear, leading one to fancy there may be some happy people after all! It is amusing, too, to watch some of those on foot, who stop in their homeward way, and peer wistfully over a range of green

palisades, that border the road in the vicinity of the Villa, and through a screen of spreading foliage, catch tempting glimpses of a winding path and veranda-like portico, where there are birds, and flowers, and vases, and which leads the way to a perfect *Tusculum* within. This dwelling is an object of interest to all the visitors at the baths; and if, like the banker's client, they have been unsuccessful in their overtures to procure access to its circle, they sometimes, nevertheless, hover curiously in the neighbourhood, and are disposed to be indignant at not having an 'open sesame' to its doors.

But as night begins to close, even these dissatisfied pedestrians must hasten their steps, for it is near tea-time, and almost every one at the baths has some one else to spend the evening with him. There is always a vast demolition of cold chickens, and cakes, and preserves, and then a little music, and a little conversation, and an immense deal of gossip. The general complaint is, that the place is rather dull; and, indeed, it must be owned, that formerly there were more facilities for spending a gay season than at present.

Some years ago, when the ex-duke came with his little court, weekly balls were given at his residence, as well as at the Casino. But all these scenes of pleasure have now passed away. The Grand-duke of Tuscany, the present possessor of Lucca, has at this moment weightier cares to occupy his attention than the summer amusements of a watering-place; the Casino, so long the opprobrium of the baths, is now closed—it is to be hoped for ever; and the English Club, or *Cercle de Réunion*, though at present in every respect flourishing, has had too much experience of the ungracious office of giving evening parties, to be inclined to resume the attempt.

The diversions of Lucca during the last summer were judiciously limited to rides and quiet tea-parties, and it may be said, that before eleven o'clock every social reunion breaks up. About ten o'clock, in fact, the shawling processes commence; and servants are seen escorting home their *padroni*, holding lanterns carefully near the ground, to guard against the contingency of their stepping on the toads, which disport themselves in all the lanes at night, and are of the size of respectable tortoises.

Then gradually the lights in every window disappear, fewer and fewer voices are borne upon the breeze, and ere the midnight bell has tolled, all is darkness and repose.

TWENTY-FOUR HOURS OF A SAILOR'S LIFE AT SEA.

ONE of the visions of youth is, that the life of a sailor is all fun, frolic, and happiness. Can there be anything more delightful, they think, than sailing about on the wide ocean, visiting far-distant regions of the earth, and seeing the strange manners of different countries? Little are they aware of the constant toil to which the poor mariner is exposed—the perils he encounters, the thankless life he is generally doomed to lead. He is, in fact, compelled to endure pretty much the lot of a slave; for, as is well known, government on shipboard is a species of despotism, often a cruel tyranny. Remonstrance in nearly every circumstance is in vain—it is mutiny. No matter how roughly orders are issued; they must be implicitly obeyed. 'D'ye murmur? Hold your tongue, you rascal, or I'll put you in irons!' Such is not a particularly uncommon form of address to the sailor, who so far forgets his position as to even hint a difference of opinion. Possibly, it is quite right, for the sake of discipline, and the safety of all concerned, that severity should be employed. We merely note the circumstance.

In the very best conducted ships, however, there must necessarily be toils and trials of temper. The most tormenting thing in a sailor's profession, is the want of that regular alternation of work through the day, and repose through the night, which is enjoyed by ordinary mortals. This is a matter on which so little is known, that we are induced to expatiate upon it. Dear landmen! would you like to know how idly and jovially a foremast Jack gets through his twenty-four hours at sea? Listen; and when we have 'said our say,' envy poor Jack his romantic calling, and begrudge him his L.2, 10s. or L.3 per month, as much as you can find in your hearts.

We are in the chief mate's watch (the larboard), and come on deck for the middle watch—that is, at 12 p.m.—having had our spell below of four hours during the first night-watch (8 p.m. to 12 p.m.) It is a cold, dark, squally night, with frequent heavy showers of rain—in fact, what seamen emphatically call 'dirty' weather, and our pea-jackets and sou'-westers are necessary enough. Hardly have we got on deck, ere the mate, who is a bit of a 'driver,' begins to order this brace to be pulled, that yard to be squared, this sheet to be belayed, that sail to be clewed up, and t'other set. The wind howls, the rain beats, the ship staggers, the salt spray flies over us from time to time. During the space of three bells, we have our hands pretty full, and then the mate bawls: 'For'ard there! In with jib; lay out, men!' The vessel is buried to her bight-heads every plunge she takes, and sometimes the solid sea pours over her bowsprit as far as the but-end of the flying jib-boom. But to hear is of course to obey; and while some of our messmates spring to the downhaul of the jib, and rattle it down the stay, we and another man get out along the bowsprit, and with our feet resting on the slippery, knotted foot-ropes to windward, we clutch hold of the jib, which is hanging down and lashing over to leeward. Pitch, pitch—splash, dash, go the bows; at one moment we are tossed high in the air, and the next we sink so low that the water reaches up to our knees as the ship settles down again, only to rise for a plunge heavier than before. We have just got the jib half-stowed, 'after a fashion,' when our messmate sings out: 'Hold hard, Jack!' and we cling for dear life. The next instant, a wave rolls a fathom high over our head, and we emerge, spluttering and gasping from a genuine cold salt-water bath, such as the hydropathists have no idea of. Before our nice little job is completed, we get two or three more comfortable duckings, and finally crawl on board half-drowned, and thankful that we were not altogether washed away, as many better fellows have been, at that same blessed task of jib-furling on a stormy night.

We have just given ourselves a good shake, like a Newfoundland dog, when four bells (2 a.m.) strike, and the man at the wheel is of course relieved, his time being up. It happens to be our turn, or 'trick,' at the wheel, and we must at once take to it, all dripping and exhausted as we are. The ship steers wildly, and we have continually to ease her when she pitches; yet, do what we can, the grumbling mate has many a complimentary word for us, flatteringly intimating his opinion, that we 'know no more about steering than our grandmother; but he'll work our old iron up to some tune, before he's done with us!' Ere our trick is out, our arms feel as stiff as iron bars, from

the violent and unrelenting strain on their muscles. The mate has steaming hot coffee brought him; but there's not a drop for poor Jack, if it would save his life. Oh, how we long to hear eight bells strike! At length they do strike, and the watch below are bid to 'tumble up, Beauties, and have a look at the lovely scenery!' We are then relieved at the wheel, and go below with our watch, hoping to enjoy four hours of blessed oblivion.

We swing ourself into our hammock (or berth, as it may happen), and are fast asleep in a minute. But we have not been an hour in the Land of Nod, ere three heavy blows from a handspike are struck on the fore-castle hatch, which is then slid back, and a hoarse voice bawls: 'All ha-and-a-ho-oy! tumble up to reef tops'ls!' Out we bundle, and grope for our clothes (the fore-castle being as dark as a dog's mouth), get them on somehow, and hurry-scurry on deck. We find the weather and sea altered much for the worse, and the Old Man (captain) himself on the quarter-deck, giving orders to the mates, who are tearing about, bawling and swearing like demons; while the 'idlers'—that is to say, the carpenter, steward, cook, and boys, who keep no regular watch—have all been roused up, to bear a hand, and 'pull their pound.' Halliards are let go, reef-tackles hauled chock-a-block, and we lay aloft helter-skelter, best man up first, and bend over the yard, till the weather-easing is secured; and then comes the welcome cry: 'Haul to leeward!' It is done, and then we all 'knot-away' with the reef-points. The reef having been taken (or two, perchance), we shin down again to mast-head the topsails, and get all in sailing trim. A grog is now served out, and we go below, to sleep out the rest of our four hours, one of which we have been deprived of by this reefing job. Sometimes it happens, however, that we lose three, or all four, when there is absolute necessity for all hands on deck.

Here, we pause a moment, to say a word on the serving of grog—a composition of rum and water. The use of this stuff is of old date in the navy, and would seem to be considered essential to navigation. In what are called temperance ships, no grog is served, neither after reefing topsails, nor at any other time; but what is very shameful, in many instances no substitute is allowed. If sailors might have coffee instead of rum, they would thankfully accept the substitute, for coffee is incomparably a better stimulant. The invigoration from rum is only momentary, and afterwards is perhaps rather pernicious; but the wholesome effect of coffee is felt for an hour. So they very excusably observe, 'Better grog than nothing!'

To resume the tenor of our narrative: at eight bells (8 a.m.) we are summoned on duty again, and find that the squall has passed over, and that it is now a fine sunshiny morning, with all available sail set, and only a heavy swell of the sea to tell what the night has been. We now get our breakfast (half an hour allowed for that), and the other watch, which has been eight hours up to our four, gets a forenoon watch below (8 a.m. to 12 a.m.) Alterations of sails and rigging, and no end of small jobs, keep us hard at work till eight bells (noon) once more strike, and we then get our luxurious dinner of a pound and a half of salt junk, with biscuits. But junk is capital stuff for sheathing material, when it is good: unfortunately, however, it too frequently is 'old horse;' and whatever its quality happens to be, all the nice juicy pieces are invariably picked out for the cabin table. Anything will do for poor Jack. His biscuits, too, are sometimes quite alive with weevils, especially on a long voyage in hot latitudes.

After dinner, all hands are on deck, and kept there till dark. In very large merchantmen, and all war-ships, this rule is departed from, and the watch is not so torturing—so true is it that the servants in small

establishments, whether on sea or land, are always the worst treated. However, we suppose that the hands are on deck. The breeze has now almost died away, and the sea runs in long, low, slow swells; the ship gently rocking, and the sails occasionally collapsing with a crash against the creaking masts. Surely, thinks the landsman, there is now nothing for Jack to do but turn his quid, crack his joke, smoke his pipe, or overhaul his chest, and put the things to rights in the fore-castle, after the 'hurrah's nest' created by the squall in the past night? Ah, friend, it is very evident that you don't 'know the ropes!' When on deck, a sailor is never idle in the day-time; even if rain is pouring, something is found for him to do; and in fine weather, like the day we are describing, there is a superabundance of work. The carpenter has his bench out—for 'a ship is like a lady's watch, always out of repair'; the steward is polishing the brass-work of the quarter-deck; the cook is scouring his pots and pans; the sailmaker is stitching away in the waist; and the crew are, one and all, engaged in picking oakum, spinning yarns (not such yarns as those amiable gentlemen, the naval novelists, talk so much about, but rope-yarns, by the aid of spinning-winches), plating sinnet, preparing chafing-gear, bowing slack rigging taut, painting boats and bulwarks, scraping yards and masts, fitting new running-rigging, overhauling the spare sails, and fifty other things—doing, in fact, everything but idling. And, mind, no conversation is allowed among the men—not a word more than necessary for the performance of their several duties. If they chat at all when on deck, it is 'on the sly,' and out of sight and hearing of the vigilant officers, who have eyes like the lynx, and ears as sharp as needles.

At 4 P.M. commences the dog-watch—that is, the ordinary watch of four hours divided into two watches of half that length; and the use of them is to shift the rotation of the night-watches. About 6 P.M. we get supper, and all hands are on deck till eight bells (8 P.M.), when the starboard-watch go below, and we, the larboard-watch, have the first night-watch—just as they had it last night, and will the next after. There is very probably plenty of work to do in shifting and trimming sails and rigging till eight bells again strike (12 P.M.), and then we summon the other watch with: 'Starboardings, ahoy!' and go below in turn; and so ends our day.

We have given a fair enough specimen of the twenty-four hours of a sailor's life at sea; but of course he sometimes has an easier, and sometimes a much harder life of it—depending on the kind of ship, the nature of the voyage, the state of the weather, and the character of the captain. Some sea-captains are excellent, kind-hearted men, and make the unavoidably hard duties of their crew as easy as it is possible; but others—and very many we fear—have terrible salt-water tyrants. A captain is the absolute master of all on board—his government, as we have said, is a despotism; and this ever-present sense of his will being law while afloat, too often hardens and brutalises an originally kind heart.

Landsmen! do you now envy and begrudge a living to the poor blue-jackets, who risk limb and life to carry on your commerce with the uttermost ends of the earth, and who man the wooden walls that alone render Britain the invincible mistress of the world? Ladies! dear, tender-hearted ladies! do you feel indifferent to the hard lot of the gallant fellows who sail the trackless ocean to supply you with silks and diamonds, with sugar and tea, and every conceivable luxury of dress and food? Be kind, we implore you, to Poor Jack, wherever you meet him, for he would shed the last drop of blood in his veins to defend you! Make every Christian allowance for his follies and his sins when ashore. Do all you can—and we think you might do much if you would—to ameliorate his physical

condition, and you will improve his moral one at the same time. For ourselves, we can only say that we ever shall own Poor Jack as a messmate and a brother, and while we have a shot in the locker, he shall freely share it, God help him!

INFLUENCE OF EXAMPLE.

In a certain village in Switzerland, some years ago, there were heavy complaints among all who possessed trees, that no fruit was safe; that the children plundered it perpetually before it came to maturity; and not only that, but that the green saplings had no security against them. Another serious complaint was the barbarity of the children towards all living creatures in their power. The clergyman, teacher, and elders, often laid their heads together, to find some remedy for this inhuman spirit, by which every child in the place was more or less affected. They could not conceive why such a spirit should prevail so specially in this village; but they could find neither cause nor remedy: all exhortations, all punishments, were in vain. The clergyman of the village was changed; and the new minister was a great friend to schools. His first walk was to the school-house. The vice of the scholars had been made known to him, and the failure of all preventive measures hitherto applied. But, determining within himself to watch the whole course of proceedings in school, he soon perceived that the teacher had a habit, and had acquired a singular dexterity in it, of knocking down and killing flies with his cane, to the end of which he had fastened a piece of leather. The windows were all on one side, and being exposed to the morning sun of summer, they were continually full of flies. The teacher's path lay along them, in front of his scholars; and while talking to the latter, he struck down the flies as they shewed themselves at the window. This manœuvre amused the children infinitely more than his instruction did, and they followed his example. They were incessantly on the watch for flies that buzzed through the room, caught them in their hands, and shewed as great dexterity in this kind of chase as their teacher in his. But their amusement did not end here: they had learned to play with their captives, treat them with detestable cruelty, and seemed to find a wicked delight in observing the shivering of their victims.

On observing these curious and far from pleasing peculiarities of the school, the intelligent and humane clergyman easily accounted for the spirit of destructiveness among the children; and his first step was to induce the teacher to take his leather from the end of the cane; and next, to turn the desks so that the boys sat with their backs to the windows, and the teacher's path lay on the other side of the room. Then the minister went frequently into the school, and examined so severely, that both teacher and pupils had more to do than to give their attention to the flies. As this was not yet entirely satisfactory in its results, the minister took advantage of the hot summer weather, to have instruction given only in the afternoon, when the school was not so full of flies, and thus he gradually banished the insects from the thoughts of teacher and children. But he knew that it was of little avail solely to pull the weeds out of the young mind. He obtained an unoccupied piece of land fit for planting, and, not far from the school, laid out a school-garden. This pleased the teacher, and the children willingly took part in the task, for they had soon learned to like their new minister, who came and worked amongst them. The garden was surrounded by a hedge planted with trees and shrubs, and each child had a tree or shrub given him to take care of. A nursery was soon laid out, and provision made for plenty of larger gardens and orchards in the village. And, behold! the spirit of

destructiveness among the children soon passed away; and every man's fruit and garden became safe, the youths even begging of their parents that trees might be planted in the fields for them to take care of. The new spirit was communicated from children to parents, till it spread throughout the entire village; every family had its pretty little garden; an emulation in cultivating flowers sprang into existence; idle and bad habits disappeared; and gradually the whole place was a scene of moral as well as of physical beauty.

This incident, the truth of which can be vouched for, has been communicated to us by a lady of rank, who happens to have lately become acquainted with the circumstances, and has thought that their publicity may be advantageous. We have no doubt of the fact, that the practice of amateur gardening is never associated with evil, but is always a token of advanced tastes and correct habits. Let every one, therefore, within his sphere, do what he can to promote this most desirable pursuit. We would further say, let every school, so far as it can conveniently be done, have its garden, not only for purposes of amusement, but as an important engine of education.

FACTS AS TO OYSTER-EATING.

The consumption of oysters in London is enormous. During the season of 1848-49, 130,000 bushels of oysters were sold in our metropolis. A million and a half of these shell-fish are consumed during each season in Edinburgh, being at the rate of more than 7300 a day. Fifty-two millions were taken from the French channel banks during the course of the year 1828; and now the number annually dredged is probably considerably greater, since the facilities of transport by rail greatly increase the inland consumption of these as of other marine luxuries. French naturalists report, that before an oyster is qualified to appear in Paris, he must undergo a course of education in discretion; for the artificial oyster-beds on the French coast, where the animals are stored to be carried away as required, are constructed between tide-marks; and their denizens, accustomed to pass the greater part of the twenty-four hours beneath the water, open their valves and gape when so situated, but close them firmly when they are exposed by the recession of the tide. Habituated to these alternations of immersion and exposure, the practice of opening and closing their valves at regular intervals becomes natural to them, and would be persisted in to their certain destruction, on their arrival in Paris, were they not ingeniously trained so as to avert the evil. Each batch of oysters intended to make the journey to the capital, is subjected to a preliminary exercise in keeping the shell closed at other hours than when the tide is out; until at length the shell-fish have learned by experience that it is necessary to do so whenever they are uncovered by sea-water. Thus they are enabled to enter the metropolis of France as polished oysters ought to do, not gaping like astounded rustics. A London oyster-man can tell the ages of his flock to a nicety. They are in perfection when from five to seven years old. The age of an oyster is not to be found out by looking into its mouth; it bears its years upon its back. Everybody who has handled an oyster-shell must have observed that it seemed as if composed of successive layers or plates overlapping each other. These are technically termed 'shoots,' and each of them marks a year's growth; so that, by counting them, we can determine at a glance the year when the creature came into the world. Up to the epoch of its maturity, the shoots are regular and successive; but after that time they become irregular, and are piled one over the other, so that the shell becomes more and more thickened and bulky. Judging from the great thickness to which some oyster-shells have attained, this mollusc is capable, if left to its natural changes and unmolested, of attaining a patriarchal longevity. Among fossil oysters, specimens are found occasionally of enormous thickness; and the amount of time that has passed

between the deposition of the bed of rock in which such an example occurs, and that which overlies it, might be calculated from careful observation of the shape and number of layers of calcareous matter composing an extinct oyster-shell. In some ancient formations, stratum above stratum of extinguished oysters may be seen, each bed consisting of full-grown and aged individuals. Happy broods these pre-Adamite congregations must have been, born in an epoch when epicures were as yet unthought of, when neither Sweeting nor Lynn had come into existence, and when there were no workers in iron to fabricate oyster-knives! Geology, and all its wonders, makes known to us scarcely one more mysterious or inexplicable than the creation of oysters long before oyster-eaters and the formation of oyster-banks—ages before dredgers! What a lamentable heap of good nourishment must have been wasted during the primeval epochs! When we meditate upon this awful fact, can we be surprised that bishops will not believe in it, and, rather than assent to the possibility of so much good living having been created to no purpose, hold faith with Mattioli and Fallopio, who maintained fossils to be the fermentations of a *materia pinguis*; or Mercati, who saw in them stones bewitched by stars; or Olivi, who described them as the 'sports of nature'; or Dr Plot, who derived them from a latent plastic virtue!—*Westminster Review*, Jan. 1852.

THE OASES OF LIBYA.

Nouour wholly waste or wretched will appear

Through all the world of Nature or of mind;

Hope's tender beamings soften Sorrow's tear,

The homeless outcast happy hours will find:

To polar snows the Aurora-fires are given,

The voice of friendship cheers the groping blind;

The dreary night hath stars to deck the heaven;

One law prevails beneficently kind:

E'en not all darkness is the silent tomb,

Faith points to bowers of bliss beyond the gloom.

So, Libya, in thy wide and fiery waste,

Gladdening the traveller, plots of verdure lie,

As if, when demons thence all life had chased,

They dropped in beauty from the pitying sky.

How weary pilgrims, dragging o'er the plain,

When first green Siwah's valleys they espy,*

Cast off their faintness! swiftly on they strain,

Drinking sweet odours, as the breeze floats by:

They see the greenery of the swelling hills,

They hear, they hear the gush of bubbling rills!

Oh! beautiful that soul-enchanting scene!

The fresh leaves twinkling, and the wild-birds singing;

The rocks so mossy, and the grass so green,

From tree to tree the vine's young tendrils swinging:

Fruits of all hue—pomegranate, plum, and peach,

Tempting the eye, and thoughts luxurious bringing;

Flowers of all breath that each stray hand may reach,

The glittering bee among them blithely winging:

While skies more clear, more blue seem to glow,

To match the bright and fairy scene below.

NICHOLAS MICKELL.

* Siwah, the Ammonia of the ancients, the most fertile of the Oases of Libya, presenting a succession of undulating hills and green meadows, watered by many springs, and producing every description of fruit-bearing trees.

EVIL-SPEAKING.

The Rev. Mr Stewart advised three questions to be put to ourselves before speaking evil of any man: First, is it true? Second, is it kind? Third, is it necessary!—*Poynder's Literary Extracts*.

THE MÆDIEVAL MANIA.

HISTORY is said to be a series of reactions. Society, like a pendulum, first drives one way, and then swings back in the opposite direction. At present, we may be said to be returning at full speed towards a taste for everything old, neglected, and for ages despised. Science and refinement have had their day, and now rude nature and the elemental are to be in the ascendant. In our boyhood, we learned the Roman alphabet; but youngsters now had need to add a knowledge of black-letter, which is rapidly getting back into fashion. Perfection is only to be found in the darkness and ignorance of the middle ages.

It is proper, no doubt, to get rid of what is tame and spiritless in art; and it must be owned that nearly everything that was done in architecture and decoration during the Georgian era was detestable. But it is one thing to reform, and another to revolutionise. Let us by all means go to nature for instruction; but nature under the exercise of cultivated feeling—selecting what tends to enoble and refine, not that which degrades and sends us back to forms and ideas totally out of place in the nineteenth century, and which, for that very reason, can have nothing but a temporary reign, to be followed in the succeeding age by a violent reaction.

On a former occasion, we drew attention to this tendency towards mediævalism as regards ornamental design, and took the Great Exhibition to witness the fact. We have also pointed to that strange phenomenon, the rise anew of monastic institutions among us, long after their object is accomplished, giving a spectre-like expression to an obsolete idea; we have exposed, likewise, the inclination of the working-classes to trust to the protection, and, on every emergency, claim as a matter of right the aid of the wealthy, thus wilfully and deliberately returning to the condition of serfdom: we have now to trace the mediæval mania in a department where, notwithstanding all this ominous conjunction of symptoms, its appearance is truly surprising—in the department of high art in painting.

Our readers need not fear that we are about to inflict on them a scientific dissertation. All we wish to do, is to explain to them a word, with the meaning of which many of them are very imperfectly acquainted, and by the mere explanation, to enable them to determine upon its claims to designate—not merely a school, but the school of art, destined, if founded in truth and nature, to overturn every other. This word—*Pre-Raphaelitism*—is taken from the name of one of the Italian masters, and it is necessary, in order to

understand the question, to ascertain what were the circumstances and the genius that have thus set him up as a landmark in the history of art.

After the fall of the Western Empire, the fine arts were lost, and their productions literally buried in the wreck. The minds of the composite nations that arose in Europe had no guide. Men were left to their own instincts, only faintly aided by the ruins and traditions of degenerate Rome; and each series of countries had its own style of art, framed or adopted by the genius of the people. During the middle ages, the style most general in Northern Europe was the Gothic; and by that term the whole system of art during the period is popularly known in England. The state of painting, under the Gothic régime, may be seen in the stained windows of the cathedrals; in which strong outlines and bright colours are laid down without any reference to *chiaro-scuro*, or the scientific arrangement of light and shadow. This seems a natural stage in art-development, and at the same moment it was seen in equal perfection in China and Europe. In the former region, the people are now beginning to advance a step beyond, through their imitation of English pictures; although, but a few years ago, they burst into fits of laughter on seeing the shadow of the nose in a portrait. In Europe, a gigantic and almost sudden stride was made, towards the close of the fifteenth century, under an influence from which the Chinese were debarred, and the nature of which we shall presently explain.

Let us first, however, just notice, that the charms of gaudy inartistic colouring frequently exercise a powerful sway even over minds familiar with better things; although that sway is always indicative of the decay of intellectual or moral freshness. Thus, it is remarked by an old Greek author (Dionysius of Halicarnassus), that the perfection to which painting had been brought by Apelles, had degenerated under Augustus; the painters being so much fascinated by the new art of colouring, that they neglected design, and preferred the brilliant or gaudy to the solid, and counterfeited to natural beauty. What this 'perfection' of Apelles was, we cannot now tell; but the probability is, that it existed only in design, and that the union of this with artistic colouring was reserved for the modern masters.

Before these masters appeared, and before the influence we are about to refer to was felt in Europe, some efforts were made by unassisted genius to rise beyond the conventionalities of the time; in the latter half of the thirteenth century, Cimabue already surpassed his modern Greek preceptors; and his disciple Giotto was considered so natural and original, that his style could not be referred to any existing school, but was

called the *maniera di Giotto*. 'Instead of the harsh outline,' says Vasari, 'circumscribing the whole figure, the glaring eyes, the pointed hands and feet, and all the defects arising from a total want of shadow, the figures of Giotto exhibit a better attitude; the heads have an air of life and freedom, the drapery is more natural, and there are even some attempts at foreshortening the limbs.' All this, however, although a decided improvement on mediæval art, was rude and imperfect—it was only the first faint dawn of a better light. 'As yet,' to use the words of Roscoe, 'the characters rarely excelled the daily prototypes of common life; and their forms, although at times sufficiently accurate, were often vulgar and heavy. . . . To everything great and elevated, the art was yet a stranger: even the celebrated picture of Pollajuolo exhibits only a group of half-naked and vulgar wretches, discharging their arrows at a miserable fellow-creature, who, by changing places with one of his murderers, might with equal propriety become a murderer himself.'

But the time at length came when that stimulus was to be communicated to taste which sent a thrill throughout the general heart of Europe. The pictures of the old Greeks were lost for ever, dead and gone; but their statues were only buried—buried alive—and now, at the command of wealth and genius, they were dug out of their tomb of ages, and came forth, unharmed, in their enchanted life and immortal beauty. Yes, unharmed; for in the head, the torso, the limb, the hand, the finger, the same principle of life existed as in the entire figure; and, owing to the sublime law of proportion, which bound all together, the minutest fragment indicated a perfect whole. The palace of Lorenzo de Medici was the assembling-place, and the ideal beauty of the Greeks found a new shrine in the groves of Florence. These became a true academia, where genius studied and taught, and where the presiding spirit of the place was Michael Angelo Buonarroti, the sculptor—painter—architect—poet, whose universal mind appeared to fit him, not so much to shine in any one department—although shine he did in all—as to give an impetus to the whole Revival. But Michael Angelo, as a painter, excelled chiefly in design; while one who was his contemporary, and being a few years later in the field, has been supposed by some to be his imitator, was the painter *par excellence* of the new era—the first great painter of the moderns. This was RAPHAEL. He was the pupil of Perugino; and while such, contented himself with imitating, with the utmost fidelity, the works of that artist; till at length emancipating himself from tutelage, he went for inspiration to the cartoons of Michael Angelo, to the sculptures of the Medici gardens, and to nature herself. Vasari makes Michael Angelo the *magnus Apollo* of Raphael; but Quatremère de Quincy assigns to the latter artist a holier worship. In a letter from him, which he quotes, respecting his famous picture of the Galatea, Raphael says, that in order to paint a beautiful woman, he must see many, but that, after all, he must work upon a certain ideal image present in his mind. 'We thus see,' says the French critic, 'that he really sought after the beautiful which Nature presents to art, but which the imagination of the artist alone can seize, and genius alone realise.'

Raphael was the first of the moderns to idealise beauty, or, in other words, to represent nature in the form she is striving, in her infinite progression, to attain, but which as yet she only indicates here and there in those hints and parts that prophetic genius combines and moulds into a whole. He softened the harsh outlines, mellowed the glaring colours, and harmonised the awkward proportions of mediæval art. With him, a new epoch commenced, adorned by many illustrious names, from Julio Romano, the poet of painters, to Titian, who dipped his pencil in the

rainbow. The Lombard school of Titian was the third of the three first great schools of the Revival, in which taste, emancipated from the darkness of the middle ages, sought inspiration in nature and the Greek sculptures. What would be thought if a school were to arise three hundred years later, not merely discarding the experience and teachings of the great masters, but claiming by its very name to return into the gulf from which these had been emancipated? This school of decline has, in fact, made its appearance among the other symptoms of the mediæval mania, and we now gravely hang up in our exhibitions the productions of the *Pre-Raphaelites*! The name at first provoked so much ridicule in England, that their friends were at pains to inform the world, that it was assumed merely for the purpose of intimating their entire separation from the schools of Raphael and his successors, and their exclusive devotion to nature. The artists of Germany, however, with whom the mania commenced, were less scrupulous.* They imitated, purposely, the rudeness of the early painters, and even favourably distinguished the juvenile works of Raphael when he was as yet the mere copyist of Perugino. It is thus only the reformed schools the *Pre-Raphaelists* avoid; for Mr Ruskin's notion, that there were no schools at all before Raphael, is quite too wild for answer.† The name, however, is of little consequence. The nature returned to is obviously, to any one who has eyes in his head, the nature of the middle ages; and if our readers will look again at the quotations we have made above—which were not taken at random—they will find, in the words of Dionysius of Halicarnassus, Vasari, and William Roscoe, a pretty accurate description of the genius and manner of the *Pre-Raphaelites*.

Nor could the fact be otherwise. We have noticed the identity of taste between the Chinese and the unawakened Europeans, as pointing to a natural stage in art-development; and if we allot to the new school a position one degree higher than that of Cimabue and Giotto, it is all that can be claimed by artists, who have even attempted to dismiss from their minds a later and nobler experience. Their rule is—to have no rule; to copy nature, just as she happens to be before them; to select nothing, reject nothing, subordinate nothing, and thus to have no composition and no *chiaro-scuro*. They recognise no inequality, no relationship of objects: a pin in a lady's dress, and the nose on the lady's face, are treated with the same even-handed justice. The harmony of colours is a mere dream: let them only be as bright as a stained-glass window, and all is well.

At this moment, there are two specimens of *Pre-Raphaelitism* to be seen at the Exhibition of the Scottish Academy in Edinburgh. They are both distinguished, like the philosopher in Andersen's *Drop of Ditch-water*, by having no name; but a quotation is appended to each of the numbers in the catalogue, and is to be supposed to indicate the subject. No. 9, in the Great Room, has this quatrain from Tennyson—

'She only said: "My life is dreary—
He cometh not!" she said;
She said: "I'm weary, away—
I would that I were dead."'

In illustration of this awkwardly-constructed stanza, a female, uncouth and ungraceful, is represented as standing in the attitude of a yawn, not indicated by the gaping mouth, but by the contorted person, and arms twisted behind the back. She is close to a stained-glass window, whose gaudy colours are challenged by her own bright blue dress, the object of the artist throughout appearing to be violent opposition, not harmony. The picture, with its violent dislocations, both of bones and

* See the *Modern Age* of Du Sommerard.

† *Pre-Raphaelitism*. By the author of *Modern Painters*.

impressions, conveys the idea of anything but repose, although a mouse on the floor bids us notice, that notwithstanding appearances, the ungainly lady stretches herself in silence. There cannot well be anything more inelegant and untrue than this piece; yet there is clever painting here and there; and some of the accessories, if taken without reference to the design, in which they are blots, are models of their kind. The thought belongs to the middle ages; the mechanical touch to the post-Raphaelite era.

The other picture, No. 93, in the same room, is larger and more ambitious. It represents a carpenter's workshop, with a mechanic at each end of the long bench; one of these, a half-starved, hideous wretch, with hardly a trace of the human anatomy in his composition; and the other, a respectable and rather sagacious-looking person, with immeasurable legs. Behind the bench is a frightful old woman, of the lowest class; and before it another, younger, but repulsively ugly and vulgar, examining, in conjunction with the respectable workman—and with her brow knotted in an awful congeries of wrinkles up to her fiery hair—the hand of a little boy. This little boy, though plebeian and red-haired, is not unpleasant; he has apparently cut his hand while playing with some of the edge-tools lying about the shop; while his brother, a better-figured as well as better-behaved boy, with a hairy apron round him, is making himself useful in carrying a basin of some dark-coloured stuff—probably carpenter's glue. But let us see what the legend attached to the number says: 'And one shall say unto him, What are these wounds in thine hands? Then he shall answer, Those with which I was wounded in the house of my friends.'—Zechariah, xlii. 6. What does this mean? It means, innocent reader, that the piece we have described in its principal features is the Holy Family of the Pre-Raphaelites! This is their mode of going to nature, selecting nothing but the mean and repulsive, and rejecting nothing but poetical and religious feeling and common decency.

But if the theory of the Pre-Raphaelites is just as regards painting, it must be just as regards the other departments of taste. Suppose it applied to musical composition. Let us throw overboard everything that degrades music to a science, and 'go to nature,' as Mr Ruskin counsels, 'rejecting nothing, selecting nothing, and scorning nothing.' What would be the result? The result would be the torture of everybody in the country who had the misfortune to possess a cultivated ear. And yet the music of that time would not be absolutely disagreeable in itself: it would merely involve the deprivation of what had become a necessary to the taste; for nature would still inspire simple sounds, connected more or less with the feelings. Nature, in fact, proceeds in music upon laws that are merely elaborated and carried out by science; while in painting, she offers an endless variety of objects and effects, to be selected, grouped, and made into a picture by the artist. We all feel this when gazing on natural scenery. We are actuated by an unconscious eclecticism, and make the composition for ourselves. To some natural scenes, no skill could impart interest of any kind; others attain to a certain character of the picturesque; while others, again, combine in themselves all the elements of a good picture. But even with these last, mere imitation will not do. Nature, as Hazlitt observes, 'has a larger canvas than man'—a canvas immensely larger; and the artist, since he cannot copy, must select. The same reasoning applies to figure and group-painting, and its accessories. Nature rarely forms a perfect group, because it is not her purpose to embody a single expression. As for small accessory objects, such as a pin or a leaf, being painted with the same care and accuracy as principal objects, this is a defect in drawing, that argues a singular want of

reflection. In nature, we see distinctly the figure and its more prominent parts, but we see the minute accessory parts so indistinctly, that sometimes we can scarcely tell what they are. The precise detailing of these objects, therefore, may have the truth of fact, but it is destitute of the truth of nature.

What would be the effect of the new system, if applied to romantic fiction? But the question is unnecessary; for the new system ignores romance, which is the truth of nature not of fact. A pre-Raphaelite story, taken from real life, might be romantic in its incidents and striking in its catastrophe; but it would want coherence in the design, and therefore produce no sustained emotion; and its characters being drawn, without selection, from vulgar prototypes, would excite more disgust than interest. The drama?—but there the new theory of art becomes too ridiculous: a tragedy on such a plan would be received with alternate yawns of ennui and shouts of laughter. All these are pertinent questions; for fine art, in literature, music, sculpture, painting, architecture, forms a homogeneous circle under one law of taste.

It may be supposed that we are ascribing too much importance to the department of the mediæval mania under examination; but, for our part, we 'scorn nothing' that presents a bar, however slight, to the progress of civilisation and refinement. Pre-Raphaelitism is only one form of a degradation of taste which appears to keep pace with the utilities of the time, and we shall never be slow in lending our aid to cleanse the temple of its desecrators. L. R.

A LEGEND OF AMEN-CORNER.

ABOUT the time that every prince in Europe was sending a special embassy to London, to congratulate James I. on his book against witchcraft, which none of them ever professed to have read, a strange occurrence happened in an ancient house, situated in the Amen-Corner of Paternoster Row. Like most of the houses of old London, its lower half was brick, and its upper, English oak. It had been built in the time of the first Tudor, but, being still a substantial tenement, was purchased some ten years before the period of this narrative, by two brothers named Christopher and Hubert, who carried on their business there. They were of English blood, but had been born in Germany, their grandfather having fled thither in Queen Mary's day under strong suspicion of owning a Coverdale Bible; and in the good city of Augsburg his son and grandsons had been brought up to his own craft, then known as the singular art and mystery of printing. A separate and a thinly-scattered guild was that of the printer in those days. Their craft had nothing in common with the world's older arts, excepting those of the scribe and the scholar. The entire book-trade, now divided into so many branches, was in their hands—binder, engraver, printer and publisher, being generally the same person; and this, together with the laborious precision required in working the primitive press, made them throughout Christendom a sort of caste who acquired their trade by inheritance, and kept it as such. Two generations of their family had transmitted the types to Christopher and Hubert; but not to them alone. There had been an elder brother, Gottlieb, who printed with them at Augsburg. Their mother had died early: the plague summoned their father when they were little more than boys, and the man grieved sore to leave his sons so young, and an edition of the Latin Fathers, which he had calculated on finishing in five years with great praise and profit, just begun; but Gottlieb promised him that he would finish the work in his name, and take care of his young brothers till they were old enough to be expert and prudent printers; so the old man died in peace.

Gottlieb was the glory of his craft, and the praise of

all Augsburg. Throughout Germany there was not a more skilful printer, nor in the city a more wise and virtuous youth. Old men asked his help in their difficulties, the young chose him as umpire in their disputes. He was charitable to the poor, a peacemaker among his neighbours, and a faithful and kindly guardian to his young brothers. Carefully he instructed them in all the mysteries of their art, though it lengthened his own labour by many a toilsome hour. Patiently he bore with the waywardness and inexperience of their youth. At hearth, and board, and labour, Gottlieb was their blithe companion; in hard work, their help; in times of trouble, their comforter; and when disputes came between them, he was the ready arbitrator, on whose justice both could rely. At the church, they sat one on either side of him; on festival and holiday, they walked out with each an arm of Gottlieb, and the burgomaster's son was not more confident in his father. Thus they lived and laboured cheerfully together, in the old house their father left them, for five years. The complete edition of the Latin Fathers went forward, and the boys grew to man's estate, till Gottlieb was no longer the tallest of the three. Neighbours remarked, too, that he looked no longer the strongest. His once ruddy cheek at times grew pale and wan; still, there was no complaint of sickness in the house, and the edition was completed. All men praised, and some printers envied the work, though it was finished in the name of their dead father.

One evening, Gottlieb rejoiced over it greatly, saying his promise was fulfilled, and Christopher and Hubert were now as good printers as himself: he bade them a kindly and glad good-night, and the young brothers talked long together, for Gottlieb slept alone; but in the morning he did not come as usual to call them, and when they went to wake him, their brother was kneeling at his bedside, with his hands clasped as if in prayer—an earlier summons had reached him, and the great soul was gone!

Honour and profit followed the work they had printed with him. Their craft grew proud of them, and friends began to say they might be burgomasters in time; but the light of their days had gone down with Gottlieb. The old house had grown so dreary without him, that they could not live in it. Every street and corner of the city brought their loss to mind; and hearing that there was peace and room for printers in their father's country, the young men sold their German dwelling to a wealthy burgher, collected their money, chattels, and types, and came with them to London. Paternoster Row was even in those days the resort of traders in books; and happening to see the antiquated house in Amen-Corner, the strangers thought it had a pleasant likeness to their old home; so they purchased it at the expense of nearly all they possessed, except their printing-press, with which they established themselves there, determined never to part, but live together in the country of their fathers.

Hard by there lived a widow of German parentage, whose husband had been a printer; but he and his seven children were all dead. Gunhilde, for such was her name, was old, poor, and lonely, and she became their housekeeper. Years of resolute toil and prudent frugality passed over the brothers, till they were no longer strangers in old London, nor inconsiderable among the inhabitants of the Row. Their press had done its part in the work of the times. They had printed the 'Book of Sports' and the 'Westminster Confession'; broadside ballads concerning Robin Hood and Maid Marian; and heavy folios on Free-will and Predestination. Christopher and Hubert had increased in substance also to a degree never dreamed of in their German home. The dealers in books began to talk of them as somewhat notable men; but cares and causes of division had come with property and importance.

In some respects, the brothers were of the same temper: both were earnest, brave, and high-spirited—strong to will, and steady to work. They had been faithful friends and loving brethren through many a change and trial; but there was a grievous fault in both. Each was given to exact from the other's friendship, though in a different fashion; for Christopher expected too much of inward affection, and Hubert had too much respect to outward observances. Alike, on the ground of resemblance and of difference, sprang up the roots of bitterness which troubled their days. At first, their strangership, their strivings to live and thrive in the English land, and, above all, the memory and loving counsels of their lost Gottlieb, had bound them heart and hand together; but as the years of manhood hardened heart and mind, as increasing gains brought leisure and anxious looks on life, differences of opinion, of tastes, and of inclinations, gradually crept in between them, and their elder brother waned away from their remembrance, far off among the scenes and familiars of youth.

Time brought further occasion of discord: the house of an English bookseller at the foot of the Row had grown more attractive than his own to Hubert, because of a certain Mistress Margaret who lived there with her father. The bookseller was old, narrow-minded, and stiff for presbytery; he approved of no people but Englishmen, and had a special prejudice against German Lutherans. His daughter believed firmly in his wisdom, and had been from infancy the old man's darling. She was fair, good, and clever; but the girl had a wayward pride, and a wit that was too ready for her judgment. Nevertheless, Hubert had found favour in her eyes as well as in those of her father, perhaps because he endeavoured earnestly to win it; while Christopher was composing tender verses, addressed to a young and very pious Catholic widow in the neighbourhood, who held fast her then persecuted faith.

The bookseller hesitated on giving his daughter to a Lutheran, and the widow remained undecided; but under their influence, Christopher and Hubert learned to contemn each other's choice, and dispute over creeds which neither acknowledged. Thus the controversies of the age, with all their bigotry and uncharitableness, found entrance to their home. Christopher lost no opportunity of throwing scorn on the Puritans, on account of the bookseller; and Hubert never spared to testify against Popish errors, by way of reflection on the widow. The loving brotherhood, which had been to them a rampart against the world's sins and follies, was broken down, and all manner of petty jealousies, vanities, and mistakes, flowed in to swell the flood of strife. There had been fierce debates and bitter words between them, wrath that overcame the friendship of years, hard misjudging of each other's motives, and mighty magnifying of small offences. One evening they sat in sullen pride and anger by the fire. It was the same hearth at which for ten years they had met when the work of the day was done. Their early difficulties in the great, strange city had been debated there. The gains of their prosperous days had been reckoned, their risks and speculations discussed, but now their seats were pushed to the most distant corners, and between them stood a table covered with papers and account-books; for they had at last determined to divide their possessions to the uttermost farthing, and part company for ever. With merchant-like exactness, every titlle was reckoned up and shared. The old house was to be sold to a Jew for a sum already agreed on, and one item only remained which they could not divide, an heirloom's value being fixed upon it. That was the Coverdale Bible with which their grandfather had fled to Germany.

Neither would consent to take the book, or receive anything in its stead, for a savage pride was in their hearts; and there lay the large worn folio, with its

brazen clasps, between them. The day's work had been hard, for though comparatively rich, Christopher and Hubert were laborious men from habit, and the elder at length leaned his head on the table to rest a moment, and think what could be done. Hubert also leaned his brow on his hand, and it might be the sight of that old volume, in spite of themselves, brought far-away memories crowding back on both. They thought of the German city where they had been born; of their long-dead father; and, last of all, of Gottlieb. They knew the grass was long upon his German grave; but suddenly, as wild and vague regrets for all that had come and gone began to rise upon them, the door of their room was opened, and there entered a stranger of most noble presence and aspect, who, without a word, drew back the table and seated himself between them.

The brothers were astonished; but when he said in their own German tongue: 'Friends, why do you muse so silently?' his voice sounded in their ears like the church-bells of Augsburg.

'We have cause for silence and musing, friend,' said Christopher.

'And what is your business with us?' demanded the fiery Hubert.

'I have come,' said the stranger, 'to shew you a rare and curious sight which lies in your very neighbourhood, though you never saw it, not having yet reached the ground from which it is rightly seen.'

'We have no time for sights at this late hour,' cried Hubert.

'Our accounts and goods occupy us now, but we will go to-morrow,' said Christopher.

'Nay, friends,' said the stranger, taking a hand of each, 'it were well that you should see it soon. All who earnestly look upon that sight, are somewhat instructed to their private benefit; and it may be that you also will learn something touching the use of these,' he added, pointing to the open account-books and the clasped Bible.

Christopher and Hubert felt persuaded to accompany him: he led them, it seemed but a few steps from their own door, through a dark and narrow lane, in which the busy men had never been; but there streets and houses abruptly terminated, and they stood by the side of a broad and thronged highway. A road like that the brothers had never seen in all their journeys. It ran due east and west, from the rising to the setting sun; but far to the eastward, a mist, like the smoke of congregated houses, shut out the view; and on the west, a fog more dense than that of autumn or mid-winter closed the prospect. The space between was thronged with travellers, who emerged from the eastern mist, and were manifestly going to the other.

A light shone on them, but it was gray and uncertain, like that of twilight. Sometimes the sun, sometimes the stars shone through, and strange clouds and meteors passed across the sky.

'What way is this,' thought the brothers, 'which lies so near our own dwelling, and yet has neither night nor day?' But as their eyes grew accustomed to the light, they perceived that the travellers on that road were of all ages—man, woman, and child. Yet each journeyed in a track cut for himself in the soil, from which it appeared none could stray. Some of these tracks were wide, and others narrow; some had numerous windings, and some were but slightly curved; many were rough and stony, others of the bare earth, with brambles growing thick at their edges; and some were half covered with grass and wild-flowers. Christopher and Hubert, however, observed that none of them were perfectly smooth or straight; that dust and rubbish were plentiful in them all; and that every track on that highway crossed some other. The travellers, too, differed wonderfully in their manner of journeying. Some moved like mourners at a funeral;

some like runners to a goal. There were those who went steadily forward, with the pace of soldiers on a march; others, who seemed in great fear, looking perpetually behind or before them; and very few who walked at their ease.

As the brothers marvelled at this diversity, they discovered that there was none of all the travellers without a burden, and in that matter there appeared no less variety. Bundles of every shape and size were on their shoulders: some looked huge, and were tied up in sackcloth; others were covered with rich cloth, and bound with silken cords. Some bore theirs concealed under long mantles; but Christopher thought it was mostly weights of iron or lead they carried. Further particulars astonished the brothers still more. The greater part appeared to have a strange propensity for increasing the difficulties of their way, by walking in whatever manner was least practicable. Many augmented the burdens, under which they already staggered, with dust and rubbish, which they collected from all sides; and far more were endeavouring to pile up the scattered stones and thorns on their equally burdened neighbours. All this time, the air was filled with a clamour of complaints, generally referring to their tracks and burdens; and Christopher and Hubert remarked with amazement, that it was by no means those who had the roughest track, or the heaviest bale to carry, that travelled most laboriously, or seemed least content with the journey.

No traveller, indeed, appeared satisfied, and whenever their tracks crossed, the unruly creatures were sure to jostle each other; but let the accident happen as it would, every man laid the blame loudly on his neighbour. They had also innumerable disputes concerning the clouds and meteors of the sky; regarding the dust under their feet; and more especially touching some glimpses of an azure heaven, which they caught at times through the western mist. On that subject, the fierceness of their debates was marvellous, and the clamour occasionally became deafening; but the brothers observed that the noisiest traveller generally came quietly out of the one mist, and disappeared with as little tumult in the other.

'What think ye of these people?' said the stranger, when Christopher and Hubert had gazed and wondered long.

'They are mad!' said Christopher, 'to give and take such trouble for no end.'

'What grievous disturbance they make about so short a journey!' cried Hubert. 'Good stranger, tell us of what Bedlam are they?'

'They belong to all the madhouses of the world,' said the stranger.

'But why are they here?—where are they going?—and what lies beyond these mists?' cried the brothers in a breath.

'Dear brothers, who were so true and loving of old,' said the stranger, 'concerning this matter, believe that you will learn hereafter; for the present, know that this which ye have seen is the great and busy road of life; but strive to become more wise and prudent travellers, and see that ye fall not out by the way.'

As he ceased, a gleam of sunshine broke through the twilight, and fell full upon him. In its brightness, the noble aspect did not alter, but grew more familiar to their eyes; and Christopher and Hubert knew at the same moment that he was none other than their brother Gottlieb. Both sprang to embrace him, but the way, the travellers, and Gottlieb, vanished from them. They looked into each other's faces by the early sunlight which streamed through the closed shutters of their room, and gleamed on the brazen clasps of the Coverdale Bible, still lying between them on the table where they had fallen asleep.

Such is the account of the affair given by themselves; although more, it is believed, to suit the taste

and belief of the time they lived in than their own. The two brothers had passed many hours silent and in the dark; and it is not unreasonable to suppose that the visionary world, into which they had unconsciously slipped, presented to both such phenomena—founded on the meditations and recollections in which both had been immersed—as were easily rendered in the exoteric types of romance. The brothers talked long over the vision, and could scarcely satisfy even themselves that it was indeed a dream; but they agreed on its use of wisdom and warning, and disputed no more. The old house was not sold, nor the types divided. It is even affirmed that the bookseller's daughter and the Catholic widow lived there as right friendly sisters-in-law; and after many a broadside and folio page, the press they had worked for so many years at length struck off the tale we have just related—the German brothers supposing that some honest men in England might profit, as they had done, by a look upon Life's Highway.

DUST-SHOWERS AND RED-RAIN.

RECENT scientific investigations in Europe and America have thrown some interesting light on the nature of these very curious phenomena. The results arrived at may be brought familiarly before our readers.

Mr Charles Darwin, in the narrative of his voyage in the *Beagle*, states that while he was at St Jago, one of the Cape de Verd islands, in January 1832: 'The atmosphere was generally very hazy; this appears chiefly due to an impalpable dust, which is constantly falling, even on vessels far out at sea. The dust,' he goes on to say, 'is of a brown colour, and under the blow-pipe, easily fuses into a black enamel. It is produced, as I believe, from the wear and tear of volcanic rocks, and must come from the coast of Africa.' The same opinion was held by scientific men generally, as well of the dust met with in the North Atlantic, as of that which sometimes falls on the islands and shores of the Mediterranean: Africa was supposed to be the original source of the air-borne particles. Some of the dust, however, having been sent to Ehrenberg of Berlin, that celebrated *savant*, after a microscopical examination, laid an account of his inquiry before the Akademie der Wissenschaften, in May 1844, in which he shewed that the dust, so far from being inorganic, contained numerous specimens of a species of flint-shelled animalcules, or infusoria, known as polygastrica, and minute portions of terrestrial plants. The investigation led him to certain conclusions: '1. That meteoric dust-rain is of terrestrial origin. 2. That the same is not a rain of volcanic ashes. 3. That it is necessarily a dust carried up to a great height by a strong current of air or whirlwind from a dried-up swamp-region. 4. That the dust neither demonstrably nor necessarily comes from Africa, notwithstanding that the wind may blow from thence as the nearest land when the dust falls, because there are in it no forms whatsoever exclusively native to Africa.' These were remarkable facts, but warranted by the evidence: one, if not more, of the animalcules was proved to be peculiar to America, and that country was naturally inferred to be the quarter from which they had been derived.

The inquiry once begun was followed up; other specimens of dust were submitted to the same critical test, and found generally to contain a much greater number and variety of infusoria than the first—mostly fresh-water forms, but with a few of marine origin;

whence the conclusion, that they had been brought from a coast-region; and especially remarkable was the fact, that among all the forms there was not one peculiar to the African continent. One example was known to belong to the Isle of France, the others were chiefly South American. After an examination of six specimens, obtained at different intervals, Ehrenberg discovered that they contained four organisms in common. 'I now consider myself,' he observes, 'justified in the conclusion, that all the Atlantic dust may come only from one and the same source, notwithstanding its extent and annual amount. The constant yellow and reddish colour of the dust, produced by ferruginous matter, its falling with the trade-winds and not with the harmattan, increase the interest of the phenomena.'

It had always been supposed, that the dust which traversed the Mediterranean was borne from the Great Sahara; but in a quantity collected on board the ship *Revenge*, at Malta, an infusoria peculiar to Chili was met with, which, with other characteristics, proved the dust to be the same as that observed on the Atlantic. Their colour, too, was identical; while the Sahara is a 'dazzling white sand': hence the dust brought across the Mediterranean by the sirocco was not peculiar to Africa. The conclusion here arrived at was still further verified by another sirocco-storm in May 1846, which extended to Genoa, and bore with it a dust that 'covered the roofs of the city in great abundance.' This, as was clearly ascertained, contained formations identical with those which had been collected off the Cape de Verd; and it was shewn that the dust-showers of the Atlantic, and those of Malta and Genoa, were 'always of a yellow ochre-like colour—not gray, like those of the kamsin, in North Africa.' The peculiar colour of the dust was found to be caused by iron-oxide; and from one-sixth to one-third of the whole proved to consist 'of determinable organic parts.' In the following year, 1847, Ehrenberg had another opportunity of testing his conclusions, in specimens of dust which had fallen in Italy and Sicily in 1802 and 1813; the same result came out on examination; 'several species peculiar to South America, and none peculiar to Africa.'

Thus, omitting the two last-mentioned instances, there had been five marked falls of dust between 1830 and 1846; how many others passed without notice, it would now be impossible to ascertain. The showers sometimes occur at a distance of 800 miles from the coast of Africa, and this region lies between the parallels of 17 and 25 degrees north latitude, and whence, as we have seen, they extend to the northern shores of the Mediterranean. In the dust collected from these various falls, there have been found altogether nineteen species of infusoria; of which eight were polythalamia, seven polygastrica, and two phytolitharia, these chiefly constituting the flint-earth portion of the dust. The iron was composed of the gailionilla, and 'the carbonic chalk earth corresponded tolerably well to the smaller number of polythalamia.' The uniform character of the specimens obtained at intervals over so long a course of years is especially remarkable.

To turn, now, for a few moments to the second phenomenon indicated in our title. In October 1846, a fearful and furious hurricane visited Lyon and the district between that city and Grenoble, during which occurred a fall of blood-rain. A number of drops were caught and preserved, and when the moisture had evaporated, there was seen the same kind of dust—of yellowish-brown or red colour—as that which had fallen in a dry state on the occasions already referred to. The strictest pains were taken to ascertain that it was not the common dust swept from roads during a gale of wind; and when placed under the microscope, it exhibited a greater proportion of fresh-water and marine formations than the former instances. Phytolitharia

were numerous, as also 'neatly-lobed vegetable scales;' which, as Ehrenberg observes, is sufficient to disprove the assertion, that the substance is formed in the atmosphere itself, and is not of European origin. For the first time, a living organism was met with—the '*Eunotia amphyois*, with its ovaries green, and therefore capable of life.' Here was a solution of the mystery: the dust, mingling with the drops of water falling from the clouds, produced the red rain. Its appearance is that of reddened water, and it cannot be called blood-like without exaggeration.

Again, in March 1847, a coloured snow fell in the Tyrol, presenting a most singular appearance, and, when dried, leaving behind a brick-coloured dust. Most of the organised forms therein contained were European and American, with a few African; and again the microscope shewed it to be similar to the dust before examined, leaving no room to suppose it of local origin. 'The predominating forms, numerically, of one kind of dust, are also the predominating forms in all the rest,' as Ehrenberg observes; and says further: 'Impossible as it is to conceive of all the storms now compared from 1880 to 1847, as having a continuous genetic connection, it is equally impossible also to imagine the masses of dust transported by them, with such a degree of similarity, *not to have a genetic connection*. . . . The great geographic extent of the phenomenon of a reddish dust nearly filling the atmosphere, and itself filled with organisms so similar, many of which are characteristic of South America, not only admits of, but demands a more earnest attention to the probable cyclical relations in the upper and lower atmosphere, whereby very great masses of fixed terrestrial matter, earths and metals, and especially flint-earths, chalk, iron, and coal, apparently heterogeneous, and yet related by certain peculiarities, are held swimming in the atmosphere, now like clouds thinly spread by whirlwinds or electricity over a broad space, and now condensed, and, like the dust of the fir-blossoms, falling in showers in every direction.'

Ehrenberg, then, states his views as to the cause of the phenomenon. 'Although far from attaching undue weight to a hypothesis, I cannot but consider it a matter of duty to seek for a connection in the facts, and feel myself constrained—on account of the above-mentioned particulars, and in so far as they justify a conclusion—to suppose an atmospheric current, connecting America and Africa with the region of the trade-winds, and sometimes, particularly about the 15th and 16th of May, turning towards Europe, and bringing with it this very peculiar, and apparently not African dust, in countless measure. If instead of attacking hypothesis by hypothesis, we strive with united effort to multiply scientific observations, we may then hope for a progressive explanation of these mysterious relations, so especially worthy of study.'

Some progress has already been made by a transatlantic investigator in the explanation so much desired by the distinguished naturalist. Lieutenant Maury, of Washington—an outline of whose views regarding the winds was given in No. 412 of this Journal—finds in Ehrenberg's researches a beautiful and interesting confirmation of his own theory; namely, that the trade-winds of either hemisphere cross the belt of equatorial calms. Observations at the Peak of Teneriffe have proved that, while the trade-wind is sweeping along the surface of the ocean in one direction, a current in the higher regions of the atmosphere is blowing in the reverse direction. According to Lieutenant Maury, a perpetual upper current prevails from South America to North Africa, the volume being equal to that which flows southward by the north-east trade-wind. This wind, it should be remembered, does not touch the African continent, but the limits of its northern border are variable; whence the fact, that the falls of dust vary between 17 and 25 degrees of north latitude, as

before stated. As the belt of calms shifts its position, so will there be a variation in the locality of the descending atmospheric current.

The dust-showers take place most frequently in spring and autumn; that is, 'after the equinoxes, but at intervals varying from thirty to fifty days;' the cause being, that the equatorial calms, at the time of the vernal equinox, extend to four degrees on either side the equator; and as the rainy season then prevails between those limits, no dust can consequently be taken up in those latitudes. But the same period is the dry season in the valley of the lower Orinoco, and the surface of that extensive region is in a favourable condition to give off dust; and at the time of the autumnal equinox, another part of the great Amazonian basin is parched with drought, on which Lieutenant Maury observes: 'May not, therefore, the whirlwinds which accompany the vernal equinox sweep over the lifeless plains of the lower Orinoco, take up the "rain-dust," which descends in the northern hemisphere in April and May—and may it not be the atmospheric disturbances which accompany the autumnal equinox, that take up the microscopic organisms from the upper Orinoco and the great Amazonian basin for the showers of October?' Humboldt gives a striking picture of the region in question, and, if the phrase may be permitted, of its dust-producing capabilities; so that the origin of this light powder, as regards one locality, may be said to be placed beyond a doubt.

As yet, the reason why the dust falls, as it were, concretely, and not generally diffused through the atmosphere, is not known; it is one of the obscure points waiting further investigation. Why it should travel so far to fall in a particular spot is, in the present state of our knowledge, not easy to explain. The coarsest dust is generally the first to fall; and it seems clear, that the descent occurs when and where the conditions are favourable. Lieutenant Maury considers, 'that certain electrical conditions are necessary to a shower of dust as well as to a thunder-storm;' and that, in the periodical intervals, we may get a clue to the rate of motion of the upper aerial currents, which appear to be 'remarkable for their general regularity, their general direction, and sharpness of limits.'

It is scarcely possible not to feel that the investigations here briefly sketched, possess unusual interest. As Ehrenberg says, the subject is one 'of vast, manifold, and rapidly-increasing importance, and is but the beginning of a future great department of knowledge.' Now that it has been published in a connected form, and the attention of scientific observers directed to it, we may hope soon to hear of corroborative evidence from all parts of the world. We may mention, as bearing on the question, that sand-showers are not unfrequent in China. Dr Mc'Gowan of Ningpo, in a communication to the Asiatic Society of Bengal, states, that at the beginning of 1851, three showers occurred within five weeks; the last, which commenced on the 26th March, and continued four days, being the heaviest. The wind during the time varied from north-east to north-west, the breeze interrupted by occasional calms. No rain had fallen for six weeks; and though, as the doctor observes, 'neither cloud, fog, nor mist obscured the heavens, yet the sun and moon were scarcely visible; the orb of day appeared as if viewed through a smoked glass, the whole sky presenting a uniform rusty hue. At times, this sameness was disturbed, exhibiting between the spectator and the sun the appearance of a water-spout, owing to the gyratory motions of the impalpable mineral. The sand penetrated the most secluded apartments; furniture wiped in the morning, would be so covered with it in the afternoon, that one could write on it legibly. In the streets, it was annoying—entering the eyes, nostrils, and mouth, and grating under the teeth. My

ophthalmic patients generally suffered a relapse, and an unusual number of new cases soon after presented themselves. Were such heavy sand-storms of frequent occurrence, diseases of the visual organs would prevail to a destructive extent.

These showers sometimes spread over several provinces at once, and far out to sea. The Chinese call them yellow-sand. Their source is the great desert of Gobi, or Sand-Ocean, more than 2000 miles long, and from 800 to 400 broad, in the interior of Asia. Dr McGowan states, that the fall amounted to ten grains per square foot, but without specifying whether this quantity includes the whole duration of the shower. During calms, it remains suspended. The dust thus raised from the Mongolian steppes gives the peculiar tinge to the Yellow Sea.

Notwithstanding the annoyance of these dust-showers, they have a valuable compensation. The Chinese, whose closeness of observation in agricultural matters is well known, assert that they are always followed by a fruitful season—not, it is true, as cause, but as effect. The explanation is, that the soil of the provinces most subject to the visitation, being of a compact character, is loosened and lightened by the sand borne on the wind from the Tatarian plains, and at the same time, the lighter fertilising matters carried away by the great rivers are replaced; and thus, that which at first sight appears an unmitigated evil, becomes the cause of good harvests, for they invariably follow a fall of sand.

THE CITY INQUEST FOR THE POOR.

I KEEP a shop in the City, and open it every morning as Bow Church bells are ringing out eight o'clock. I pay a very heavy rent, as well as Queen's taxes and poor's-rates; and I could do neither, to say nothing of maintaining my family, if I did not mind my business, and work hard. But by the help of constant attention and industry, I am happy to say, I am able to make my shop keep me and my family too, which it does comfortably, and lifts me, in some sort, above the world, and enables me to bear the character, which I should always like to retain, of a respectable man.

We dwellers in London City proper are supposed to entertain a very high regard for respectability, and so we do; and I am going now to detail the operations of what, I suppose, must be called an institution altogether peculiar to the City, of which the world out of the City knows very little, and which has been in being I don't know how many centuries—before there were any poor-laws, or any 'good Queen Bess'; and which must have been a respectable affair—if I am any judge of what that means—from the very first, whenever that was. It is a good thing to relieve necessity in any shape, and a better thing to help it to help itself; but to dispense charity without doing a mischief in some way or other, either by rewarding imposture, encouraging idleness, or repressing the springs of self-reliance or self-exertion, is about the hardest business I have ever had to do with, and I have had some knotty affairs to get through in my time. Now, the various wards of the City do every year, I think, manage this difficult matter very carefully and efficiently, though not without a good deal of trouble; and as I think their mode of doing it sets a good example, I have made up my mind to let the public know something about the Inquest for the Poor, which comes off in December every year. I believe it will be a novelty to most people out of the City limits, and to not a few within

them as well. What I know about it, I have derived from experience: that, indeed, is all I have to relate; and when I have told my tale, the reader will be as wise as I am, in this respect at least.

About the middle of last December, I received a citation to attend a wardmote, to be held in the school-room of my parish. I was in expectation of this summons, as, the parishioners being called upon in rotation, I knew that my turn would come on upon this occasion. The number of tradesmen, who must be all of respectable character, summoned to the first meeting, is always greater than the number required to serve on the inquest, because many find it very inconvenient, and others find it impossible, to give their services. Valid excuses are admitted in plea against the performance of the duty; but a frivolous excuse is not allowed; and a tradesman, whose turn it is to serve, if he can prefer no good reason for not serving, must serve or pay the fine. Six guineas is the heavy penalty inflicted upon a recusant who declines service altogether. This preliminary meeting is called merely to insure a sufficient company to be in attendance in the vestry of — Church, at the general wardmote held on St Thomas's Day.

After an early breakfast on the morning of the day above named, I repaired to the vestry, which was very fully attended, and where, in the course of the forenoon, the common-councilmen for the ward were elected for the ensuing year, and, their election settled, were all duly admonished respecting their duties by the chairman. Then, from the number of respectable tradesmen in attendance, myself and eleven others were elected to prosecute the inquest for that year on behalf of the poor; and we in our turn were admonished by the same authority, that we were not to compass any treason, nor to conspire against Her Majesty the Queen—than which, I am very sure, nothing could have been further from our thoughts. The inquest being thus incorporated, we proceeded to elect a foreman and a treasurer, and to decree fines for non-attendance. The fines were appropriated to the payment of expenses, no part of the money collected being available for any other purpose than that of charity. The collection commenced by a contribution from each member of the inquest, each giving liberally, and setting a generous example. All these necessary preliminaries being settled, every man of us got into a handsome cloak, trimmed with fur, hired for the occasion, at a cost of five shillings per head, and, with the beadle of the ward blazing in scarlet and gold, pacing majestically beneath a three-cornered hat, and pushing a ponderous gold mace in advance, we were marched off to Guildhall, to pass muster before Gog and Magog, and to be presented to his worship the lord mayor. His lordship, who was surrounded by a staff of officials in gorgeous liveries, was very glad to see us: indeed he told us so—said that he was extremely gratified at receiving so highly respectable a company, and expressed more than once his satisfaction at finding that we were so ready to act in the cause of charity as to sacrifice our valuable time, and unite together for the succour of the distressed. He addressed us, in fact, for nearly a minute and a half; after which, as time was pressing, and others were waiting to be presented, we were signaled forward to a side-door, and made a very sudden exit into the street, whence we marched back to the vestry to disrobe, with the exception of some few of our number,

who knowing that the business of the charity was done for the day, abandoned their cloaks to the care of the owner, who contrives generally to be in attendance at this critical moment, and proceeded to look after their own private affairs. We all met, however, in the evening, and partook of a substantial dinner, to which, according to a custom which has prevailed from time immemorial, the church-wardens of the parish and the foreman and treasurer of the inquest of the preceding year were invited. The dinner went off, as a dinner should do, with perfect harmony and good-feeling; and some very excellent speeches were made on the subject of the inquest—its undeniable efficacy and utility, and its great antiquity. We broke up at a sober hour, each member being charged to present himself at the vestry at nine in the morning on that day week, under the penalty of half-a-guinea.

It would have suited my interests very well, when the day came round, to have forfeited my half-guinea, and have attended exclusively to my own business; but judging it more to my credit to go through with the work I had undertaken, I was at my post, together with several of my colleagues, before the hour had struck. Some of our members did not come at all the first day, but sent their half-guineas; others, having to come in from the suburbs before omnibus-time, arrived too late, and were fined in smaller sums for the breach of punctuality. Our party being at length complete, to the number of ten, we indue our cloaks, and, pioneered by the ward-beadle with his ponderous mace, we sally forth to feel the charitable pulse of several parishes. Ten good men and true, swathed to the chin in voluminous folds of broad-cloth fringed with fur, and headed by the ample proportions of the mace-bearer in scarlet and cloth of gold; our apparition, and our mission too, were plainly a mystery to the major part of the population, who, seeing us but once a year, and then but momentarily, as the procession emerges suddenly from one door to plunge into another, do not very well know what to make of it. 'Is that there a buryin' or a marryin'?' 'What's that lot o' fellows after?' 'What's up now, Jem?'—such are a few of the inquiries which from time to time testified the astonishment of the uninitiated; to all of which our imperturbable leader opposed a face as impenetrable as that of the sphinx of the desert. We should have been sadly at a loss, by the way, without him. He knew every soul in the whole ward who would come down to the extent of a sixpence for the sake of the poor; and he led his small phalanx boldly to the charge through all impediments. Under his guidance, we did what certainly we should never have attempted without it. We stormed the stout citadels of the merchants, and carried their strongholds up as high as the third and fourth floors, and captured many a poor man's dinner from the very jaws of the cash-box. We dived into cellars, and crouched and crept into subterranean dens. We threaded muddy lanes, and wandered among bewildering wharfs, and mounted lofts and sheds, and squeezed ourselves into all sorts of out-of-the-way slums. We climbed ladders leading up into creaking timber galleries, and got into regions of old planks and cobwebs, dim with dust and odorous with ancient smells. We assailed the scholar at his studies, and the craftsman at his labour, and from all and each we met with a courteous reception, and gathered the sinews of benevolence. The dispositions of men vary in few things more than in their several modes of conferring a favour. Some of our most liberal donors thoughtfully sent their bank-notes to the vestry, to save us the trouble of waiting upon them; others, on the contrary, levied the full value of their gifts, by keeping us wearily waiting before we got them: A barber, whom we found at his block busily weaving a wig, and whose diminutive crib would not contain half our company, apologised because it was not in his power to do much for us, and

then diffidently tendered a guinea. A portly dealer in feminine luxuries talked largely of the claims of our indigent brethren, and the sacred obligations of charity, and wound up his sonorous homily with the climax of half-a-crown. We found one burly gentleman, buried up to the elbows in red-tape and legal documents, who professed a perfect horror, a rooted antipathy, to the poor in every shape, and who had a decided conviction that poverty was a nuisance which ought to be put down. When he had said all this, and a great deal more, he very consistently lent a hand towards abating the nuisance, by presenting us with a contribution of double his usual annual subscription. When we had got out of earshot, our experienced chaperon remarked to me: 'When I hered him agoin' on so, I knowed he was agoin' to come down 'ansome. He's a very nice genelman, what enjoys a grumble, and don't mind paying for it!'

Our domiciliary visits occupied between three and four days, and the rain fell in torrents during the whole time. We were wet through in spite of the cloaks we wore, but canvassed the whole district successfully notwithstanding, and probably collected every shilling that was to be got. Our guide had so often felt the pulse of the whole ward in this way, that he never suffered us to waste our time or our demands upon those whom he knew to be impracticable; and thus we got through the business much more quickly, as well as more prosperously, than we could possibly have done had we been left to our own resources. The result of our united labours was a purse of nearly £200; and now came the more pleasant part of our duty—the distribution of alms, at a season when poverty is most severely felt, to the most deserving of the most needy.

The distribution took place a few days after the collection was finished. In the interim, blank tickets had been distributed to such of the donors as chose to receive them, upon which they inscribed the names of the poor persons whom they recommended for relief. The vestry where we were elected was the scene of the distribution. The body of the church was allotted for the accommodation of the poor ticket-holders, who formed a numerous and very motley crowd, and who were called in to receive their dole in rotation, by the ward-beadle, from a list which he had prepared. I suspect, however, that the system of rotation was not very rigidly observed, inasmuch as half-a-dozen women, with squalling children in their arms, were among the very first who were called in and dealt with, by which means something like peace and quietness were obtained while the claims of the crowd of the remaining applicants were severally considered. What followed was a very different affair from that which transpires weekly at the parish pay-table. I have been church-warden, overseer, and guardian of various parishes in my time, and I have seen the poor in all conditions and under all circumstances, and I thought I knew them well enough; but I derived a new lesson now, and learned that it is possible for humanity to undergo the direst misfortunes without losing heart and hope—to drain the cup of misery to the dregs without becoming utterly selfish—and to be long immersed in the lowest depths of necessity, and yet be human still. I shall describe one or two of these hapless claimants upon the benevolence of their wealthy fellow-citizens, premising that a few of them only are the recipients of parish pay. They see no disgrace, perhaps, in participating in a voluntary alms, because it is voluntary, and, as such, cannot be regarded as the peculiar property of that numerous class who assert and maintain a life-interest in compulsory funds legally levied for their support.

One of the first who seemed to attract general sympathy was an old, old man, trembling on the very verge of the grave, who had outlived almost every faculty of mind and body. He could walk only by instinct, advancing his foot mechanically, to save himself from

falling, when he was pushed gently forwards. When standing, he could not seat himself—and when sitting, he could not get up without help. In whatever posture he was placed, there he remained. Altogether insensible to question and remark, he looked wildly round upon us, and smiled, and winked with both eyes. These were his sole remaining capabilities—to wink, and to look agreeable. He had been recommended as an object worthy of charity by a liberal donor, and he was brought in person to justify the recommendation. He was clean, and neat, and tidily dressed, but evidently in a state of perfect unconsciousness of everything around him. He had lived once, but it was in times long past and gone: you might guess him to be what age you chose, but you could hardly think him older than he was; time, who had stolen his faculties, had forgotten to wreck the casket that contained them: the spirit of life had left its tenement, and by some strange mistake, the animated machine had gone on without it. My neighbour, the watchmaker, compared him to a clock with the striking-train run down, and the works rusty beyond repair. He could not thank us for the alms we gave him, but he did all he could—he winked, and smiled, and tried to make a bow, but failed in the attempt, and resigned himself cheerfully to the care of his friends, who carried him off.

Another quiet applicant was a lady, whose natural-born gentility poverty might obscure but could not conceal. Years of want and struggling deprivation had dimmed her charms; but they had neither bowed nor bent her stately form, nor quenched the inherent virtue of self-respect, nor deprived her of the correct and appropriate diction, and the winning and courteous expression which once graced a drawing-room. She was introduced to us by the beadle as Lady W—; and although draped in very humble and well-worn apparel, she looked what she was—a gentlewoman in every sense of the word; though beyond an empty title, she possessed hardly anything in the world. She answered our inquiries with a natural courtesy, which at least some of us felt to be a condescension. 'Gentlemen,' she said, 'it is true, as your attendant states, that I am a lady. In my youth, I married a titled man. I make no boast of that—it was, indeed, my misfortune. I was brought up and educated to occupy a station inferior to few: I filled that station for many years; it is not for me to say how appropriately; and though calamity has overtaken me now, and I have been familiar with necessity for so long a time, yet I feel that I am a lady still. I may be reproached with poverty, and that I can bear; but I trust I shall never be justly reproached with having fallen to the level of my circumstances. I am grateful to you for the assistance you so kindly render me; and I can express that sentiment, and feel it deeply, too, without humiliation, because the aid you supply is as voluntary on your part as its acceptance is necessary on mine.' When our foreman had instinctively wrapped the donation awarded to her in a quarter sheet of letter-paper, and presented her with it, she bent with a dignified obeisance, and silently withdrew.

A third applicant, worthy of a passing notice, was a lady of a very different stamp. Who or what she had been in former years, I could not ascertain, but she appeared before us in the character of a middle-aged mince-pie monomaniac, and jam-tart amateur. The poor harmless creature was clad in the veriest shreds of dusky feminine attire, which barely shielded her limbs from the inclemency of the weather. She had a notion that she, too, was a lady, and that, being a lady, she was bound to live by the consumption of pastry, and nothing else. We were admonished by our custodian that whatever amount we awarded her, whether it were much or little, would be forthwith consigned to the confectioner, in exchange for mince-pies and tarts of the very best quality; and I regret to say, that this

announcement had the effect of reducing considerably the sum she derived from the charity of the ward, and effectually preventing the consummation of any very formidable debauch with her favourite viands. But the poor simpleton was as merry as she was innocent and harmless; and all unsuspicious of the latent grudge which had lessened her gratuity, tripped hastily off, to enjoy at least one delicious repast.

After we had sat some hours, a very distressing case was brought forward. A poor woman, the wife of a working-man, and the mother of a young family, had been deserted by her husband, who had left her, besides her own children, the charge of his bedridden parents. Under this accumulation of burdens, she had been heroically struggling for some months, in the vain attempt, by her single energies, to ward off the approach of want, and to act at the same time the part of nurse to the old couple. She had succeeded in a great measure, and modestly sought but a little help to enable her to persevere in her arduous undertaking.

Then came an old man, verging on fourscore, the very *beau idéal* of the merchant's serving-man of the last century. He had once been comparatively prosperous, but, judging from his cheerful face, perhaps hardly ever happier than he was now. For fifty years of his life, he had been *custos* and confidential house-keeper to a well-known firm, which, after four or five generations of unvarying prosperity, had sunk in the panic of 1846 into the gulf of bankruptcy. In the general wreck that followed, old Benjamin was forgotten, or remembered only with a pang of unavailing regret. He found a refuge, however, in some small garret, where he contrives to preserve his cheerfulness and his pigtail, the only outward and visible sign of his former respectability, and where he acts as master of the ceremonies to a clique of ancient ladies, his fellow-lodgers, to whom he is at once the guardian and the beau of the fourth floor. When he had received his own little modicum of benevolence, he pleaded hard for the immediate settlement of the claim of one of his fair *coterie*, a widow of fourscore and five; and finding that his request could not be complied with, but that she must be left till her turn came, he retired to a corner of the room, and waited a full hour and more, until her business was settled, when he bowed ceremoniously, till his pigtail pointed to the zenith, and tendering his arm, escorted her home with all the vivacity and politeness of the days of hoops and high-heeled shoes. I have scarcely yet found out the reason why it was that the spectacle of this happy, kind old soul, made me feel a little, only a little, ashamed of myself.

This cosy old couple had hardly tripped out of sight, when our prosy synod was honoured by the advent of a real and extraordinary phenomenon. This was nothing less than a half-crazy poetess, who prided herself on speaking in rhyme—and such rhyme, amusing from its very badness. On she was going at a great rate, when she was called to order in a manner which admitted of no demur.

'Mrs Margaret Maggs!' roared the beadle; and the tenth Muse, brought to a sudden stand-still, ceased her oracular utterances, and, grasping her modicum of shining silver, vanished from the presence.

The distribution lasted the whole of the day; and it was a weary day for some of the poor applicants, whose turn came last, and who almost fainted for want of refreshment. But all who deserved it, went home effectually relieved and gladdened; and many who did not, got a lesson upon the occasion, and learned that Charity is not always as blind as she is supposed to be. The whole of the money collected is not distributed at once. About a third part of the amount is reserved until the approach of the next ensuing winter, when a second distribution takes place, generally to the same applicants.

I have heard it insinuated before now, that City functionaries of all sorts are prone to take too good

care of themselves, whenever they meet to consider the wants of the poor. I may perhaps be allowed to say, that when we have a feast, we pay for it; and that not one farthing of any collection made in the City for the poor was ever, to my knowledge, appropriated to any other purpose. As a respectable man, I, for one, would never countenance any intromission of that kind.

OCCASIONAL NOTES.

LONDON CAB REFORM.

Ir John Bull were not, with all his grumbling, one of the most patient animals in existence, he could never have endured so long the cabs which he has to employ for the conveyance of his person through the streets of his metropolis. They are very poorly furnished and nasty, far below similar conveyances in any continental city with which we are acquainted. Greater fault still is to be found with the drivers, a large proportion of whom are so prone to overreach, that it is hardly possible to settle for their fares without a squabble. Our experience leads us to say, that at an average a stranger pays 30 per cent. above the proper sum, besides having his temper in almost every instance ruffled to some extent by the sense of having no adequate protection from the rudeness of this class of men. For a lady, there seems to be no chance of escape but by the alternative of some enormous overcharge. Altogether, this department of public economy in London is in a most unsatisfactory state. Most people avoid using these street vehicles whenever they can, and this is especially true of strangers. We can state as a fact, that a provincial gentleman of our acquaintance is accustomed to take the inconvenience of the cab-system into account in deliberating whether he shall have a month of London life or not. It is one of the repelling considerations, to a degree that the Londoners themselves are not aware of.

In an age of such exquisite contrivance and precision in mechanical and commercial matters, it might have been anticipated that the bad system of London cabs could not long survive. All dishonest businesses write their own doom. Those only thrive which sincerely seek the good of the public. Accordingly, it is not surprising, at a time when one-and-a-half per cent. is a fact in banking, to find two large and powerful companies getting up to supersede the bad, old, dear, cheating cabs with a new and civilised set. It is proposed by one of these bodies to 'provide for the public a superior class of carriages, horses, and drivers, at reduced and definite fares; to afford the utmost possible security for property, and especially prompt and easy redress of complaints.' With better vehicles at three-fourths of the present charges—namely, 6d. a mile—and these to be settled for in a manner which will preclude disputes, this company deserves, and will be sure to obtain, the public patronage. One good feature of the proposed arrangements will, we think, be highly satisfactory: the company will form a sufficient magistracy in itself to give quick and easy redress in the case of any wrong. But, indeed, from the precautions taken as to the employment of drivers, and the hold which the company will have over them, through the medium of guarantee and their own deposits in a benefit-fund, it seems to us that the good conduct of the men towards their 'fares' must be effectually secured. The other company proposes to have two classes of vehicles—one at 8d. and the other at 4d. a mile; and it contemplates the use of a mechanism for indicating the distance passed over. We most earnestly hope that both companies will succeed in establishing themselves and carrying an improvement so important to the public into effect.

COLONIAL PENNY-POSTAGE.

'I shall write to every one in turn, but it is expensive sending to many at once,' says one of the poor

needlewomen, whom Mr Sydney Herbert's Female Emigration Fund has enabled to obtain a comfortable home at Adelaide. Well might she complain of the expense. When at home, she could send a letter to the most distant corner of the United Kingdom for a penny. In Australia, she finds that the cost of sending a letter to her mother in London is a shilling. It is strange that the colonists do not make an outcry about so extravagant a charge. Of all the anomalies in English legislation, our colonial postage-system is certainly one of the most glaring; and yet, in the midst of so much effort for emigration and colonisation, hardly any one seems to be aware of it. The people of England, Ireland, and Scotland have, for the last twelve years, enjoyed the incalculable benefits of Penny-Postage, but they have never thought of extending its blessings to their fellow-countrymen, scattered abroad among our various colonies over the whole surface of the globe.

Under the old dear system, the cost of sending a letter home from any of the colonies was not felt so much as it is now. The emigrant, before he left home, had always been accustomed to pay from 9d. to 1s. 2d. for letters from distant parts of the United Kingdom, and he could not complain at finding the postage from Canada or Australia to the mother-country only a little dearer. But the case has been entirely changed since Rowland Hill's plan came into operation. What seemed a moderate rate before that great improvement took place, is now an exorbitant charge, which no working-man will pay very frequently. In this, as in most other affairs, it is not the actual but the comparative cost of the article which makes it seem dear. To a person who has recently left his native land, and who is probably still suffering from homesickness, a letter from any beloved friend or relative is worth far more than many shillings; indeed, the value cannot be estimated in sterling coin. But, unfortunately, the first mode in which the emigrant discovers that the social luxury of correspondence has advanced 1100 per cent. in price, is not in the tempting shape of a letter from home. He must first write to his friends before he can expect them to write to him, and that is a task which nine persons out of ten, on the most charitable calculation, are very strongly tempted to procrastinate, from day to day, even without any pecuniary obstacle. But how much stronger the temptation to put off the writing of 'that letter' from day to day for weeks, and at last for months, when the poor emigrant, still struggling with difficulties, finds that, instead of only a penny for each letter, he must now pay a shilling? What wonder though many thousands, who have left friends and relatives behind them, all anxiously on the outlook for some tidings of their welfare, should defer the task of writing home for a month or two, finding it so dear; and, having got over the first few months, gradually become careless, and never write home at all? There are few people who have not known many instances of this kind; and we have little doubt that it is owing mainly to this cause that they have given up all correspondence with the old country.

It is strange that Mr Sydney Herbert, Mrs Chisholm, and the rest of those honourable men and women who have taken so much pains to promote emigration, should not have seen the importance of obtaining colonial postage reform. Mr Gibbon Wakefield, in his *England and America*, published nearly twenty years ago, lays much stress upon the impulse which healthy emigration to our colonies would derive from any measure which should enable the poorer class of emigrants to write home more frequently. As a proof of this, he remarks, that the great emigration from England which had recently taken place—an increase of about 200 per cent. over former years—had been mainly caused by the publication of letters from poor

emigrants to their friends at home. With a view to encourage such correspondence, he suggests that, for some years after their arrival in a colony, poor emigrants should be allowed the privilege of sending their letters free of postage. Thanks to Rowland Hill, we have learned that letters can be carried at so very small a cost, that even the poor can afford to pay the sum charged by the post-office authorities in this country; and it requires little more than a stroke of the colonial secretary's pen to extend the same invaluable privilege to the thousands of emigrants who leave this country every month for some one or other of our numerous colonies. What Mr Gibbon Wakefield says of the free-postage plan of that time, would apply with nearly equal force to the proposed Colonial Penny-Postage:—'In this way, not only would the necessary evil of going to a colony be diminished—that is, the emigrants would depart with the pleasant assurance of being able to communicate with their friends at home—but the poorer classes in the mother-country would always hear the truth as to the prospects of emigrants; and not only the truth, but truth in which they would not suspect any falsehood.' He goes on to say, that the statements published about that time, by an emigration-board sitting in Downing Street, shewing what high wages were obtainable in the colonies, 'though perfectly true, have not been received with implicit faith by the harassed, and therefore suspicious class to whom they were addressed; nor would any statements made by the government ever obtain so much credit as letters from the emigrants themselves.' All who have ever paid any attention to the subject of emigration, and who have mixed familiarly among the poorer classes, will agree with Mr Wakefield. All the government returns that ever were made, backed by ever so many extracts from colonial newspapers, about the high rate of wages, and the cheapness of provisions, will not make half the impression upon a poor man which a single letter from an emigrant brother, a son, or a trustworthy friend, will produce.

We should be glad to see the country rouse itself on this important question, regarding which numerous meetings have already been held.

SURVEYING VOYAGE OF THE RATTLESNAKE.

SIXTH war went out of fashion, many officers of the British navy have been employed in exploring seas, and surveying coasts, in different parts of the world, for the laudable purpose of facilitating navigation; and there would be little harm in supposing, that there might be as much glory in verifying the position and extent of a shoal or sunken rock, as in capturing an enemy's frigate. At all events, these surveying voyages furnish useful occupation, not unattended with danger; and they involve the necessity for a good deal of hard work, of a dry and technical character, three years being the time usually allotted to a cruise. Australia, owing to the dangerous character of its northern and eastern shores, has been the scene of numerous surveys, among the latest of which was that by Captain Blackwood in the *Fly*. One important result of this survey was the finding of a passage through the great Barrier Reef for vessels navigating Torres Strait; but as more than one passage was considered essential to the safety of a route so much frequented, the *Rattlesnake* was commissioned, in September 1846, for a further survey, to be carried on in what is called the Coral Sea, having New Guinea, the Louisiade Archipelago, and the continent of Australia, as its boundaries *

After some months spent in preliminary examination of different parts of the Australian shores and seas, the *Rattlesnake* sailed from Sydney, at the end of April 1848, for the main object of her cruise. She had the *Bramble*, a small schooner, as tender, and was accompanied by the *Tam o' Shanter*, a vessel chartered for the conveyance of Mr Kennedy's expedition, which was to land at Rockingham Bay, 1200 miles to the northward, 'and explore the country to the eastward of the dividing range, running along the north-east coast of Australia, at a variable distance from the shore, and terminating at Cape York.' Having assisted in landing this party, and arranged to meet them at the head of Princess Charlotte's Bay, on their toilsome, and, as it proved, disastrous overland journey, the ships pursued their route, and soon commenced a series of triangulations, which were continued without a break for more than 600 miles. The *Bramble* waited ten days at the appointed rendezvous without seeing anything of the overland expedition, which, as it afterwards appeared, did not reach the same latitude until two months later, and then at a considerable distance from the coast.

In October, the vessels were at Cape York, waiting for Mr Kennedy, and receiving supplies from a store-ship despatched from Sydney, and letters from the 'post-office' on Booby Island. In his capacity as naturalist and ethnologist, Mr Macgillivray made frequent excursions, collecting plants and animals, and words for a vocabulary. The natives are described as inordinately fond of smoking whenever they can get *choka*, as they call tobacco. 'The pipe—which is a piece of bamboo as thick as the arm, and two or three feet long—is first filled with tobacco-smoke, and then handed round the company, seated on the ground in a ring; each takes a long inhalation, and passes the pipe to his neighbour, slowly allowing the smoke to exhale. On several occasions at Cape York,' continues the author, 'I have seen a native so affected by a single inhalation, as to be rendered nearly senseless, with the perspiration bursting out at every pore, and require a draught of water to restore him; and although myself a smoker, yet, on the only occasion when I tried this mode of using tobacco, the sensations of nausea and faintness were produced.' There is something new in the idea of taking whiffs of ready-made smoke, which might perhaps be turned to account by enterprising purveyors of social enjoyments on this side of the world.

After the abortive attempt to establish the colony of 'North Australia' at Port Curtis, at a cost of £15,000, and the abandonment of Port Essington, it is not uninteresting to learn that Cape York presents many natural capabilities for a settlement. There is a good harbour, safe anchorage, abundance of fresh water all the year round, and a moderate extent of cultivable land, all of which will help to constitute it a desirable coaling station for the contemplated line of steamers from Sydney to Singapore and India. The Port-Essington experiment was so complete a failure, that after trying for eleven years, the colonists were 'not even able to keep themselves in fresh vegetables.' Fortunately, but little encouragement was ever offered to permanent settlers, or the disappointments caused by an unproductive soil and unhealthy climate would have been greatly multiplied. A singular example of the *lex talionis* occurred among the natives at this place. One of them having been severely wounded in punishment for an offence, the penalty was considered too severe, and 'it was finally determined that, upon Munjerrijo's recovery, the two natives who had wounded him should offer their heads to him to be struck with a club—the usual way, it would appear, of settling such matters.'

Here we find, too, another of those instances of intelligence in a native, the more extraordinary when

* Narrative of the Voyage of H. M. S. *Rattlesnake*, commanded by the late Captain Owen Stanley, during the years 1846-50, including Discoveries and Surveys in New Guinea, the Louisiade Archipelago, &c. &c. By John Macgillivray, F.R.G.S., Naturalist to the Expedition. London: Boone. 2 vols. 8vo.

contrasted with the low mental condition of the aborigines in general. Sir Thomas Mitchell, and other Australian travellers, have spoken of their acutely-endowed guides in terms almost of affection; and Mr Macgillivray relates that, during his stay at Port Essington, a native named Neimnal became greatly attached to him. 'One day,' he continues, 'while detained by rainy weather at my camp, I was busy in skinning a fish; Neimnal watched me attentively for some time, and then withdrew, but returned in half an hour afterwards with the skin of another fish in his hand, prepared by himself, and so well done, too, that it was added to the collection. He went with us to Singapore, Java, and Sydney, and, from his great good-humour, became a favourite with all on board—picking up the English language with facility, and readily conforming himself to our customs and the discipline of the ship. He was very cleanly in his personal habits, and paid much attention to his dress, which was always kept neat and tidy. I was often much amused and surprised by the oddity and justness of his remarks upon the many strange sights which a voyage of this kind brought before him.' The *Nemesis* steamer underweigh puzzled him at first; he then thought it was 'all same big cart, only got him shingles (wooden roofing-tiles, so called) on wheels!' Neimnal spoke of his countrymen as 'big fools,' and held white men in such estimation, that he volunteered for a voyage to England; but having been prevented, returned to Port Essington, where he learned to read and write. His superiority rendered him obnoxious to the older members of his family; and one day, while on a visit to his tribe, 'he was roused from sleep to find himself surrounded by a host of savages thirsting for his blood. They told him to rise, but he merely raised himself upon his elbow, and said: "If you want to kill me, do so where I am; I won't get up. Give me a spear and club, and I'll fight you all one by one!" He had scarcely spoken, when he was speared from behind; spear after spear followed, and as he lay writhing on the ground, his savage murderers literally dashed him to pieces with their clubs.'

In June 1849, the *Rattlesnake* and *Bramble* were at work in the Louisiade Archipelago, finding out the safest channels and anchorages among its numerous rocks, shoals, and reefs. The natives of some of the islands had never seen Europeans before, yet seemed little inclined to acknowledge the superiority of their visitors. They manifested but little alarm on witnessing the effects of firearms; and on one occasion attacked two of the ship's boats with a courage and self-reliance extraordinary under the circumstances. In general characteristics, they resemble the Torres Strait islanders: some of them friz their hair up into a mop two feet in diameter, wear a comb nearly a yard long, and bunches of dogs' teeth hanging behind, by way of ornament, and take no little pride in adorning their persons with paint and tattoo-marks, and flowers and plants of strong odour. Bracelets of various kinds are a favourite decoration, and among these the most curious 'is that made of a human lower jaw, with one or more collar-bones closing the upper side, crossing from one angle to the other. Whether these are the jaws of former friends or enemies,' says Mr Macgillivray, 'we had no means of ascertaining; no great value appeared to be attached to them; and it was observed, as a curious circumstance, that none of these jaws had the teeth discoloured by the practice of betel-chewing.'

A supply of yams being wanted, the cutter was sent one day at the beginning of July to open a trade, if possible, with the natives of Brierly Island, on which occasion 'Mr Brady took charge of the bartering, and drawing a number of lines upon the sandy beach, explained that when each was covered with a yam, he would give an axe in return. At first, some little

difficulty occurred, as the yams were brought down very slowly—two or three at a time; but at length the first batch was completed, and the axe handed over. The man who got it had been trembling with anxiety for some time back, holding Mr Brady by the arm, and watching the promised axe with eager eye. When he obtained possession of it, he became quite wild with joy, laughing and screaming, and flourishing the axe over his head. After this commencement, the bartering went on briskly, amidst a great deal of uproar—the men passing between the village and the beach at full speed, with basketfuls of yams, and too intent on getting the *kiram kelumai* (iron axes) to think of anything else.' In this way, 368 pounds of yams were collected, at a cost of about a half-penny per pound.

Among contrivances for procuring food, the natives of some of the islands train the sucking-fish (*Echeneis remora*) for the chase in the water, as dogs are trained to hunt on land. A line is made fast to the creature's tail; it is then started in pursuit of prey, and as soon as it has attached itself to a turtle, or any other 'game,' the line is hauled in, and the prize secured. While the *Rattlesnake* lay at anchor, a number of sucking-fishes took up their quarters under her bottom, and whenever the sailors dropped a bait overboard, it was always seized by one of the *remora*, greatly to the annoyance of the anglers on deck. 'Being quite a nuisance,' writes Mr Macgillivray, 'and useless as food, Jack often treated them as he would a shark, by "spritsail-yarding," or some still less refined mode of torture. One day, some of us, while walking the poop, had our attention directed to a sucking-fish, about two and a half feet in length, which had been made fast by the tail to a billet of wood, by a fathom or so of spun-yarn, and turned adrift. An immense striped shark, apparently about fourteen feet in length, which had been cruising about the ship all the morning, sailed slowly up, and turning slightly on one side, attempted to seize the seemingly helpless fish; but the sucker, with great dexterity, made himself fast in a moment to the shark's back. Off darted the monster at full speed—the sucker holding on as fast as a limpet to a rock, and the billet towing astern. He then rolled over and over, tumbling about, when, wearied with his efforts, he lay quiet for a little. Seeing the float, the shark got it into his mouth, and disengaging the sucker by a tug on the line, made a bolt at the fish; but his puny antagonist was again too quick, and fixing himself close behind the dorsal fin, defied the efforts of the shark to disengage him, although he rolled over and over, lashing the water with his tail until it foamed all round.' After such a spirited combat, it is somewhat tantalising to read, that the final result could not clearly be made out; it is scarcely possible, however, not to wish success to the *remora*.

On the 18th August, a party landed on the coast of New Guinea, and paid a friendly visit to some of the Papuans who had been off to the ship, and found them less fierce and distrustful than those of the islands. Some of them thought the muskets were water-vessels, and others were afraid of a knife: it was too sharp. They are excellent mimics; and one of them imitated the English drummer so cleverly on an old tin-can, as to excite roars of laughter among all who witnessed the performance. Some of their dances are extraordinary, more resembling a fencing-match than movements of the light fantastic toe; and the following description of a dance after nightfall is curious:—'On seeing a number of lights along the beach, we at first thought they proceeded from a fishing-party, but on looking through a night-glass, the group was seen to consist of above a dozen people, each carrying a blazing torch, and going through the movements of a dance. At one time, they extended rapidly into line; at another, closed, dividing into two parties, advancing and retreating, crossing

and recrossing, and mixing up with each other. This continued for half an hour; and having apparently been got up for our amusement, a rocket was sent up for theirs, and a blue-light burned; but the dancing had ceased, and the lights disappeared.

On the 1st October, the *Rattlesnake* was again at Cape York. About the middle of the month, an incident occurred which relieved the dullness of a period of inactivity—the discovery and rescue of a white woman, who had been for some time a prisoner among the natives. We shall abridge Mr Macgillivray's narrative of her story. Her name is Barbara Thomson; she was born at Aberdeen, and emigrated to New South Wales with her parents. About four and a half years prior to the event, she had accompanied her husband in a small cutter, to try to save some part of the cargo of a whaler that had been wrecked on the Bampton shoal. The pilot missed his route, two of the crew were drowned by accident, another was left on a desert island, and at last the little vessel, caught by a gale in Torres Strait, struck upon a reef on Prince of Wales Island. The only two men left on board were drowned in attempting to swim to shore; but the woman was saved by a party of natives, one of whom, Boroto by name, forced her to live with him as his wife, in which position she for a time was exposed to much cruelty, owing to the jealousy of the women of the tribe. She eventually was saved from persecution by a singular belief prevalent among the natives—that white people are the ghosts of departed aborigines—one of the principal among the blacks having persuaded himself that he had found in her his long-lost daughter, after whom Barbara was named Gion. The head-quarters of the tribe were on an island, and the captive frequently saw vessels pass on their way to Torres Strait, but without any opportunity of making her case known. She had heard of the first arrival of the *Rattlesnake* and tender at Cape York; and on the last visit, had induced the blacks to escort her to within a short distance of the anchorage, they believing that she only wished to shake hands with her countrymen, and would soon return, laden with knives, axes, and tobacco. Although lame, she hurried on, fearing that her conductors might change their mind, and made towards some of the ship's company, who were on shore shooting. Except a fringe of leaves, she was quite naked, and her appearance was so dirty and miserable, that they took her for a gin, or native woman, and paid no attention to her, when she called out: 'I am a white woman; why do you leave me?' She was immediately taken on board the ship, and but just in time to escape from a small party of the tribe, who had followed to detain her.

Mr Macgillivray continues: 'Upon being asked by Captain Stanley, whether she really preferred remaining with us to accompanying the natives back to their island, as she would be allowed her free choice in the matter, she was so much agitated as to find difficulty in expressing her thankfulness, making use of scraps of English alternately with the Kowrarega language, and then, suddenly awakening to the recollection that she was not understood, the poor creature blushed all over, and with downcast eyes beat her forehead with her hand, as if to assist in collecting her scattered thoughts. At length, after a pause, she found words to say: "Sir, I am a Christian, and would rather go back to my own friends." At the same time, it was remarked by every one that she had not lost the feelings of womanly modesty; even after having lived so long among naked blacks, she seemed acutely to feel the singularity of her position, dressed only in a couple of shirts, in the midst of a crowd of her own countrymen.'

In accordance with her wish, Mrs Thomson was kept on board, and had a cabin given up to her own use; good living and medical attendance soon cured the soreness of her tanned and blistered skin, and the

ophthalmia, which had deprived her of the sight of one eye. The black Boroto grew desperate when he found that she would not return to him, and threatened to cut off her head to satisfy his vengeance—a catastrophe which the rescued woman avoided by not going on shore; and she was eventually handed over, in good condition, to her parents on the return of the vessel to Sydney, at the beginning of 1850.

Shortly afterwards, to the great sorrow of all on board, Captain Stanley died, at the early age of thirty-eight. He had brought his scientific labours to a successful close, and might have looked forward to a brief period of honourable repose; but the fatigue and anxiety of a laborious survey in a hot climate, and the news of the decease of his father, the late Bishop of Norwich, depressed him beyond the power of recovery. This was not the only melancholy incident connected with the *Rattlesnake's* voyage. Mr Kennedy's expedition had proved a most disastrous failure. The party, as we have seen, had landed in Rockingham Bay, and commenced their journey northwards, with a well-appointed caravan of carts, horses, and men, all in high spirits. But more than a month elapsed before they could extricate themselves from the swamps and scrub which cover that part of the country; and at the beginning of November, five months later, they had not advanced more than 400 miles in a direct line: nineteen of the horses were dead, and the stock of provisions nearly exhausted. Mr Kennedy then determined on pushing forwards, with a light party, for Cape York, 150 miles distant, whence relief was to be sent to the eight individuals who were left behind, nearly worn out with fatigue and exhaustion. This party consisted of the leader; Jackey Jackey, a faithful and intelligent native; and three of the strongest of the men. One of the latter accidentally shot himself, and the other two became so weak, that they also were left at an encampment, with as large a supply of provisions as could be spared. After incredible hardships, Mr Kennedy and his companion reached Escape River, twenty miles from Cape York, where they were attacked by a party of natives, while entangled in a scrub, and the gallant leader of the expedition fell a victim to their ferocity. Three spears had entered his body, and Jackey Jackey, in simple but touching words, describes his last moments. 'Mr Kennedy,' he asked, after having carried the wounded man out of sight of the natives, 'are you going to leave me?' 'Yes, my boy, I am going to leave you,' was the reply of the dying man. 'I am very bad, Jackey. You take the books, Jackey, to the captain; but not the big ones: the governor will give anything for them.' 'I then tied up the papers. He then said: "Jackey, give me paper, and I will write." I gave him paper and pencil, and he tried to write; and he then fell back and died, and I caught him as he fell back, and held him, and I then turned round myself, and cried. I was crying a good while, until I got well; that was about an hour, and then I buried him. I dug up the ground with a tomahawk, and covered him over with logs, then grass, and my shirt and trousers. That night I left him, near dark.'

Jackey contrived to evade the pursuers, and a week afterwards got on board the schooner, which was lying in Port Albany, Cape York, waiting the arrival of Mr Kennedy's expedition. On learning the fatal result, the captain sailed, in the hope of saving the men who had been left behind. Of the two who had belonged to the advanced party, nothing was discovered except some articles of clothing, and it was believed they had perished. Of the eight first left near Weymouth Bay, two were still alive, but in the last stage of exhaustion, having endured privations and hardships almost without a parallel.

The brig *Freak* was subsequently despatched from Sydney, for the purpose of securing any papers or

documents, or the mortal remains of any of the unfortunate expedition. Jackey Jackey was on board, and by means of his remarkable sagacity, led the way to the respective camps. The bones of two of the men were found; also some of Mr Kennedy's instruments, portions of his clothing, and his manuscript journal, which had been hidden in the hollow of a tree; but after a minute search for the place where his body had been buried, it could not be discovered.

We might extend this painful narrative did our space permit; but we must now close, with a recommendation of the book under notice to those who are interested in the progress of natural or geographical discovery.

A CELEBRATED FRENCH CLOCKMAKER.

THE superiority of French clocks and watches has been achieved only by the laborious efforts of many ingenious artisans. Of one of these, to whom France owes no little of its celebrity in this branch of art, we propose to speak. Bréguet was the name of this remarkable individual. He was a native of Neuchâtel, in Switzerland, and thence he was removed, while young, to Versailles, for the purpose of learning his business as a horologist. His parents being poor, he found it necessary to rely on his own energy for advancement in life.

At Versailles, he served a regular apprenticeship, during which his diligence in improving himself was almost beyond example. He became greatly attached to his profession; and soon, by studious perseverance, his talents were developed by real knowledge. At length the term of apprenticeship expired, and as the master was expressing to the pupil the satisfaction which his good conduct and diligence had given him, he was struck with astonishment when he replied: 'Master, I have a favour to ask of you. I feel that I have not always as I ought employed my time, which was to have indemnified you for the cares and lessons you have spent on me. I beg of you, then, to permit me to continue with you three months longer without salary.' This request confirmed the attachment of the master to his pupil. But scarcely was the apprenticeship of the latter over, when he lost his mother and his stepfather, and found himself alone in the world with an elder sister—being thus left to provide, by his own industry, for the maintenance of two persons. Nevertheless, he ardently desired to complete his necessary studies, for he felt that the knowledge of mathematics was absolutely indispensable to his attaining perfection in his art. This determined purpose conquered every obstacle. Not only did he labour perseveringly for his sister and himself, but also found means to attend regularly a course of public lectures which the Abbé Marie was then giving at the College Mazarin. The professor, having remarked the unwearied assiduity of the young clockmaker, made a friend of him, and delighted in considering him as his beloved pupil. This friendship, founded on the truest esteem and the most affectionate gratitude, contributed wondrously to the progress of the student.

The great metamorphosis which was effected so suddenly in the young clockmaker was very remarkable. There is something very encouraging in his example, affording as it does a proof of the power of the man who arms himself with a determined purpose. At first, the struggle with difficulties appears hard, painful, almost impossible; but only let there be a little perseverance, the obstacles vanish one after the other, the way is made plain: instead of the thorns which seem to choke it, verdant laurels suddenly spring up, the reward of constant and unwearied labour. Thus it was with our studious apprentice. His ideas soon expand; his work acquires more precision; a new

and a more extended horizon opens before him. From a skilful workman, it is not long before he becomes an accomplished artist. Yet a few years, and the name of Bréguet is celebrated.

At the epoch of the first troubles of the Revolution of 1789, Bréguet had already founded the establishment which has since produced so many master-pieces of mechanism. The most honourable, the most flattering reputation was his. One anecdote will serve to prove the high repute in which he was held, even out of France. One day a watch, to the construction of which he had given his whole attention, happened to fall into the hands of Arnold, the celebrated English watchmaker. He examined it with interest, and surveyed with admiration the simplicity of its mechanism, the perfection of the workmanship. He could scarcely be persuaded that a specimen thus executed could be the work of French industry. Yielding to the love of his art, he immediately set out for Paris, without any other object than simply to become acquainted with the French artist. On arriving in Paris, he went immediately to see Bréguet, and soon these two men were acquainted with each other. They seem, indeed, to have formed a mutual friendship. In order that Bréguet might give Arnold the highest token of his esteem and affection, he requested him to take his son with him to be taught his profession, and this was acceded to.

The Revolution destroyed the first establishment of Bréguet, and finally forced the great artist to seek an asylum on a foreign shore. There generous assistance enabled him, with his son, to continue his ingenious experiments in his art. At length, having returned to Paris after two years' absence, he opened a new establishment, which continued to flourish till 1823, when France lost this man, the pride and boast of its industrial class. Bréguet was member of the Institute, was clockmaker to the navy, and member of the Bureau of Longitude. He was indeed the most celebrated clockmaker of the age; he had brought to perfection every branch of his art. Nothing could surpass the delicacy and ingenuity of his free escapement with a maintaining power. To him we owe another escapement called 'natural,' in which there is no spring, and oil is not needed; but another, and still more perfect one, is the double escapement, where the precision of the contacts renders the use of oil equally unnecessary, and in which the waste of power in the pendulum is repaired at each vibration.

The sea-watches or chronometers of Bréguet are famous throughout the world. It is well known that these watches are every moment subject to change of position, from the rolling and pitching of the vessel. Bréguet conceived the bold thought of enclosing the whole mechanism of the escapement and the spring in a circular envelope, making a complete revolution every two minutes. The inequality of position is thus, as it were, equalised on that short lapse of time; the mechanism itself producing compensation, whether the chronometer is subjected to any continuous movement, or kept steady in an inclined or upright position. Bréguet did still more: he found means to preserve the regularity of his chronometers even in case of their getting any sudden shock or fall, and this he did by the parachute. Sir Thomas Brisbane put one of them to the proof, carrying it about with him on horseback, and on long journeys and voyages; in sixteen months, the greatest daily loss was only a second and a half—that is, the 57,600th part of a daily revolution.

Such is the encouraging example of Bréguet, who was at first only a workman. And to this he owes his being the best judge of good workmen, as he was the best friend to them. He sought out such everywhere, even in other countries; gave them the instruction of a master of the art; and treated them with the kindness of a father. They were indebted to him for their

prosperity, and he owed to them the increase of fortune and of fame. He well understood the advantages of a judicious division of labour, according to the several capabilities of artisans. By this means, he was able to meet the demand for pieces of his workmanship, not less remarkable for elegance and beauty than for extreme accuracy. It may indeed be said, that Bréguet's efforts gave a character to French horology that it has never lost. So much may one man do in his day and generation to give an impetus to an important branch of national industry.

SAINT ELIZABETH OF BOHEMIA.

'Would that we two were lying
Beneath the church-yard sod,
With our limbs at rest in the green earth's breast,
And our souls at home with God!'

I NEVER lay me down to sleep at night
But in my heart I sing that little song:
The angels hear it, as, a pitying throng,
They touch my burning lids with fingers bright,
Like moonbeams—pale, impalpable, and light.
And when my daily pious tasks are done,
And all my patient prayers said one by one,
God hears it. Seems it sinful in His sight
That round my slow burnt-offering of quenched will,
One quivering human sigh creeps windlike still!
That when my orisons in silence fail,
Lingers one tremulous note of human wail!
Dear lord—spouse—hero—martyr—saint! erelong
I think God will forgive my singing that poor song.

A year ago, I bade my little son
Bear on a pilgrimage a sacred load
Of alms; he cried out, fainting on the road,
'Mother, O mother, would that this were done!'
Him I reproved with tears, and said: 'Go on,
Nor feebly sink ere half thy task be o'er.'
Would not God say to me the same, and more!
I will not sing that song. Thou, dearest one,
Husband—no, *brother*—stretch thy steadfast hand
Across the void! Mine grasps it. Now I stand,
My woman-weakness nerved to strength divine.
We'll quaff life's aloe-cup as though 'twere wine,
Each to the other; journeying on apart,
Till at heaven's golden doors we two leap heart to heart.

A MAN-OF-WAR, OR A MAN OF PEACE.

It will probably be remembered that, a few years ago, a great excitement was caused by the discovery of vast deposits of guano upon the island of Ichaboe, situated on the west coast of Africa. The remarkable fertilising qualities of guano gave it great value as an article of commerce, and a large number of vessels were despatched from various ports to take in cargoes at the island. It was computed that at one time not less than 500 vessels were lying off Ichaboe, and as there was no settled authority to regulate the trade of the place, a scene of indescribable confusion and tumult soon presented itself. The crews of several of the ships having established themselves upon the table-land at the top of the island (the island being little more than a huge rock, rising with almost perpendicular cliffs from the ocean), a dispute arose between them and their captains, which soon proceeded to open mutiny on the part of the men. The only access to their position being by long ladders, the men set their masters at defiance, and held possession of their stronghold, which was inaccessible, except by permission of the mutineers. The captains despatched a vessel to the Cape of Good Hope, for the purpose of laying a complaint before the governor, and soliciting his aid. The governor was about

to despatch a man-of-war—the only remedy that is generally thought of in such cases—when a good, devoted man, a missionary at Cape Town, named Bertram, hearing of the affair, represented to the governor his earnest desire to spare the effusion of blood, and his conviction that, if he were allowed to proceed to the island, he could bring the quarrel to an amicable settlement. Mr Bertram obtained the consent of the authorities, and the order for the sailing of the man-of-war was suspended. He proceeded to Ichaboe, and being rowed ashore, began to ascend one of the lofty ladders. Two seamen, well armed, who had guard above, shouted to know who he was and what he wanted. 'A friend, who wants to speak to you,' was the reply. The guards seeing a single man, unarmed, climbing fearlessly towards them, permitted him to ascend. He called the men round him, spoke kindly but faithfully to them, heard their complaints, and undertook to negotiate for them. He did this with so much tact and judgment, that a reconciliation was soon effected, and harmony restored between the captains and their crews. Mr Bertram remained ten days with the men on the summit of the island, employing the time to the best advantage in preaching and teaching amongst them. It was only on the plea of urgent duty that the men would permit him to leave them. They clustered round him, as he was about to descend from amongst them for the last time; each was eager to wring him by the hand, and tears rolled down many a weather-beaten cheek as he bade them a last adieu. 'God bless you, sir!' they exclaimed; 'you have been our true friend; would that you could stay amongst us, for we feel that you have done us good.' It will be well for nations when they have more faith in the power of a man of peace, and less in that of a man-of-war. —*Bond of Brotherhood.*

NOTE TO INTENDING EMIGRANTS.

In reply to numerous correspondents who make inquiry respecting the most suitable fields for emigration, we have again to intimate, that we cannot assume the responsibility of privately advising individuals on the important step of emigrating to one place in preference to another. Every one is best acquainted with his own desires, abilities, and necessities, and should, with the general assistance of public opinion and the press, be able to make up his mind whether he should or should not emigrate, or what distant land will be to him most answerable and agreeable. With the view of doing all in our power to assist in forming this resolution, we have lately had prepared, under our own inspection, a series of cheap and accessible Manuals on the subject of Emigration; containing, we believe, all desirable information for those who are disposed to emigrate; and a perusal of which may possibly obviate the necessity of seeking private counsel on any point. The Manuals may be had from any of the ordinary agents for supplying this Journal; they separately refer to AUSTRALIA, AMERICA, NEW ZEALAND, the CAPE, and PORT NATAL; and in addition, there is one devoted to general considerations and directions. The whole, however, may be obtained bound in a single volume.

Price 4s. 6d. Cloth, Lettered,

THE EMIGRANT'S MANUAL.

A complete MANUAL for EMIGRANTS, embracing the latest and most trustworthy information, in One Volume. It may also be had in Parts, each referring to a distinct FIELD OF EMIGRATION.

AUSTRALIA, 1s. — NEW ZEALAND, CAPE OF GOOD HOPE, &c. 1s. — BRITISH AMERICA, and UNITED STATES of AMERICA, 1s. — EMIGRATION in its PRACTICAL APPLICATION to INDIVIDUALS and COMMUNITIES, 1s.

Printed and Published by W. and R. CHAMBERS, High Street, Edinburgh. Also sold by W. S. ORR, Amen Corner, London; D. N. CHAMBERS, 35 West Nile Street, Glasgow; and J. M'GLASSAR, 50 Upper Sackville Street, Dublin. — Advertisements for Monthly Parts are requested to be sent to MAXWELL & Co., 21 Nicholas Lane, Lombard Street, London, to whom all applications respecting their insertion must be made.

* From Kingsley's *Saint's Tragedy*. Elizabeth, Princess of Bohemia, the most sincere among the mistaken devotee saints of the middle ages, renounced her royal state, her husband and children, and spent her life in the sternest asceticism, and in the most self denying acts of charity.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 433. NEW SERIES.

SATURDAY, APRIL 17, 1852.

PRICE 1½d.

THE DINGY HOUSE.

LONDON is like a large company, where it is necessary for the master or mistress of the house to introduce a great many people to each other. Everybody in that overgrown metropolis has things within a few doors of his residence, which, if they were suddenly described to him, he would hear of with deep interest or extreme astonishment. There is a plain back street near the Haymarket, bearing the title of Great Windmill Street, in which there is a large, dingy-looking house standing somewhat detached, and not appearing to be in the hands of ordinary tenants. Very near this, is a distinguished haunt of gaiety, very well whitened, and looking very smart, but which would be no index to the character or purposes of the dingy mansion. A group of dirty children will be found disporting at marbles or pitch-and-toss on the paved recess in front; but neither would that scene be found in any kind of harmony with the house itself. It is evidently a house with a mystery.

Very few people would be found in the course of a day to pass out of or into that house. A blind would seldom be raised. A fashionable carriage would not once in a twelvemonth be seen rolling up to the gloomy portals. Supposing, however, that any one were to be so curious as to watch the house for an afternoon, he would probably see two women in extraordinary dresses come up to the door, apparently laden with some heavy packages, shrouded under their wide black cloaks. He would see the door opened with some caution, and the two women would then walk in, and be seen no more for that day. He might speculate for hours about the business in which these women had been engaged, but in vain. He might make inquiries in the neighbourhood, but probably with as little result; for, in London, it must be an extraordinary family indeed which provokes any inquiry among neighbours, and most undoubtedly the inmates of the mansion would never think of proclaiming what they were, or how they lived.

Having perhaps by this time excited some curiosity, we must endeavour to satisfy it. We happened by mere chance, when spending an evening with a friend in a distant part of the town, to hear of this house and its tenants; and the doings and character of its inmates struck our mind as something so extraordinary, and in some respects so beautiful, that we resolved, if possible, to pay it a visit. We did so a few days thereafter, under the conduct of a young friend, who kindly undertook to smooth away all difficulties in the way of our reception. We can, therefore, give some account of the dingy house, with a tolerable

assurance that, strange as the matter may appear, it is no more than true.

This dingy house is possessed by ten women, chiefly natives of France, who form a branch of a religious society of recent origin in that country, entitled, *Les Petites Sœurs des Pauvres* (*Little Sisterhood for the Poor*.) They have been in this house only for a few months, but are already fully engaged in the business to which they have devoted themselves—which is the care and nurture of infirm and destitute old women. The extraordinary thing is that the Sisters, though most of them are in their education and previous habits *ladies*, literally go about begging for the means of maintaining these poor people. Everything is done, indeed, by begging; for on entering the sisterhood they renounce all earthly possessions. They have begged the means of furnishing their house, and paying their rent, which is not an inconsiderable sum; they daily beg for the food, clothes, and cordials required for themselves and the objects of their charity. What is even more singular, these ladies in all respects *serve* the old women, wash for them, cook for them, act as their nurses. They treat themselves less kindly, for out of the broken victuals on which exclusively the house is supported, the old women always get the first selection, and the ladies only the remaining scraps. It is altogether the most striking example of self-denial and self-devotion which has ever happened to fall under our attention in this country.

We were received in a faded old dining-room, by a Sister whose age surprised us, for she did not appear to be above five-and-twenty. Her dress consisted of coarse black serge, and a linen cap, such as is worn by poor old women in the country. She was evidently a well-educated and refined English lady, who, under a different impulse, might have very probably been indulging at this moment in the gaieties of Almacks. With great courtesy, but without for a moment departing from the serious manner in which she had first addressed us, she conducted us through the house, and explained its various arrangements. We were first shewn into a large hall in the rear, where we found about thirty little beds, only a few of which were occupied, the greater number of the inmates being able to sit up and move about the house. Nothing could exceed the homeliness of the furniture, though everything was remarkably clean. In another dormitory up stairs, we found ten or twelve bedrid women, one of them within a few months of completing the hundredth year of her age, but able to converse. Another was a comparatively young woman, who had three months ago had a limb amputated. A Sister, in her plain dark dress, stood in this room, ready to attend

any of the poor women. We were next conducted to a large room, where a number of the inmates were at dinner. They rose modestly at our entrance, and we had some difficulty in inducing them to resume their seats. We were curious to see the viands, knowing that they were composed solely of the crumbs from the rich man's table, and having some idea, that as most of the Sisters were French, there might be some skill shewn in putting these morsels into new and palatable forms. We did not, however, find that the dishes were superior to what might have been expected in a workhouse. The principal article was a pudding, composed of pounded scraps and crusts of bread, and bearing much the appearance of the oatmeal porridge of Scotland. Ladies attend the old women at table, acting entirely as servants do in a gentleman's dining-room, though only in the limited extent to which such services are required at a meal so simple. It is only after this meal is concluded, that the ladies sit down to their own equally frugal fare. We were curious to know if they indulge in tea, considering this as a sort of crucial test of their self-denying principles. We were informed that the article is not bought for them, on account of its being so expensive. Used tea-leaves are obtained from the tables of certain families of rank, and are found to be of service for the comfort of the more infirm women. After the inmates are served, if any tea be left, it is taken by the ladies.

We next descended to the kitchen, and there found a young woman at work as a cook, not a Sister, but one who may be so ere long, if she passes her novitiate successfully. The magazine of crusts and lumps of bread, of broken meat and cold soups, coffee and tea, which we saw here, was a curious sight. We were also shewn the pails and baskets in which the Sisters collect these viands. Two go forth every morning, and make a round of several hours amongst houses where they are permitted to apply. Meat goes into one compartment, bread into another. A pail of two divisions keeps a variety of things distinct from each other. Demurely pass the dark pair along the crowded thoroughfares of the metropolis, objects of momentary curiosity to many that pass them, but never pausing for a moment on their charitable mission. The only approach to a smile on our conductress's face, was when she related to us how, on their return one afternoon, a poor woman who had lost a child, traced them to the door, and made a disturbance there, under a belief that the cloak of one of them, instead of covering a collection of broken meat, concealed her infant.

We were curious to trace the feelings which actuated these ladies in devoting themselves to duties so apt to be repulsive to their class. Viewing the whole matter with a regard to its humane results, we did not doubt that benevolence was the impulse most concerned, directly or indirectly, though we of course knew that a religious sanction was essential to the scheme. In a conversation, however, with our conductress, we could not bring her to admit that mere humanity had anything to do with it. The basis on which they proceed is simply that text in which Christ expresses his appreciation of those who give a cup of cold water in his name. It is professedly nothing more than an example of those charitable societies which arise in connection with the Catholic faith, and in obedience to its principles, and which require that entire renunciation of the world which to a Protestant mind appears so objectionable. We have little doubt, nevertheless, that a certain amount of benevolence is a necessary, though it may not be a directly acknowledged pre-requisite for the profession; for it is admitted that some novices find that they have not the *vocation*, and abandon the attempt; while others, by the grace of God, are enabled to go on. We cannot regard this idea of '*vocation*' as something entirely apart from the inherent feelings.

So far as we could understand, the Sisters regard

more expressly the value of the act of obedience to the injunction of Christ, than the feeling from which, we would say, the injunction sprang—an error, as we most humbly think, though one of a kind which we do not feel called upon to discuss in the presence of results so much in accordance with our own best feelings. We would only say, that there is something disappointing in finding how much the whole procedure is beheld by these self-devoting women, as reflecting on their own destinies. It appears that their patients often grumble both at the food and the attendance which they receive. The Sisters say, they like to meet an ungrateful old woman, as it tries their humility and forbearance: it makes the greater merit towards an end in which they themselves are concerned. Now, we would put all this aside, and think only of the divinely recommended sentiment of the text, as calculated in some degree to make our life on earth an approach to that of its author. It is really hypercritical, however, even to intimate these dissenting remarks, especially when our main end is, after all, merely to bring the public into knowledge of an extraordinary phenomenon in human conduct, going on in an age which seems generally of so opposite a character.

The Society of *Les Petites Sœurs* is, it appears, a new one, having originated only a few years ago in the exertions of an old female servant, who, having saved a little money, thought it could not be better employed than in succouring the aged and infirm of her own sex. Her idea was taken up by others of her own order, as well as by women of superior grade. The society was formed, and establishments were quickly set up in various parts of France. It was only in 1851 that a detachment of the sisterhood came to England, and settled themselves in Great Windmill Street, where, whatever be their motives, it must be admitted they contribute in no slight degree to the alleviation of that vast mass of misery which seems an inseparable element of large cities. They had, at the time of our visit, forty-seven old persons under their care.

At a subsequent period of the same day, we visited an establishment somewhat similar at Hammersmith—at least similar in the repulsive character of the duties, though externally much more elegant. It is housed in a range of good buildings secluded in a garden, and is devoted to the reception of unfortunate young women who, under penitent feelings, wish to be restored to respectable society. The Sisterhood of the Good Shepherd, as they are called, entertain in this house nearly 100 such women, who, while undergoing the process of religious and moral regeneration, employ themselves in washing, so as to contribute to their own support. We saw the whole engaged in their humble employment, excepting a few who were under training in a school. At all times, in their bedrooms, at their meals, in their work-rooms, in their play-ground, they are under the immediate eye of some of the Sisters; but the general treatment includes as much kindness as is consistent with the object held in view. One trait of this kindness struck us as involving a remarkable delicacy: there is never, from first to last, one word of reference made to their former life. They are accepted as so many children coming to school for the first time. Even their names are sunk out of sight, and new ones applied. The Sisters speak of them as '*the children*.' We learned that Protestant women are welcomed, but are expected not to stand out in inconvenient dissent from the ordinary rules of the house. We walked into the garden under the care of the mother-superior, and saw their little burial-ground, marked with low wooden crosses inscribed to Laura, to Perpetua, to Mary of the Seven Dolours, and other such names, indicating so many unfortunates who had here found a rest from their troubles. We likewise visited the chapel, the body of which is arranged for the use of the sisterhood; while a wing running off at the side of the altar, and

concealed from view, is provided with seats for the penitents. The whole establishment is characterised by remarkably good taste. There is here a more cheerful tone than in the Great Windmill Street institution. The Sisters spoke, as usual, of being entirely happy—that unaccountable phenomenon to a Protestant mind.

We do not need to inform the reader, that conventional establishments are not now so thin-sown in England as they were a few years ago, or that they occasionally draw into their circle individuals who started in life with very different prospects before them. The whole subject is one worthy of some inquiry, as a feature of our social state, by no means devoid of political importance; and it is for this very reason that we draw attention to the subject. Instead of contemptuously ignoring such things, let them, we say, be made known and investigated in a calm and philosophical spirit. It is for want of a steady comprehension of facts of the kind here adverted to, that an illusion is kept up respecting our existing social condition. It is heedlessly said, and every one repeats the error, that the age is a hard, mechanical one, which shines only in splendid materialities; but is it compatible with this notion, that there is ten times more earnest religious feeling of one kind and another than there was thirty years ago; that antiquities, mediæval literature and architecture, are studied with a zeal hitherto unknown; and that such mystical writers as Carlyle, Tennyson, and Browning, carry off the palm from all the calm-blooded old-school men of letters? We rather think it is the most romantic, supra-material age that has yet been seen. The resurrection of conventional life, in some instances Catholic, in others Protestant, appears to us as one of the facts of this unexpected reaction, which doubtless will run its course, and then give place to something else, though not, we trust, till out of its commixture of good and evil some novelty hopeful for humanity has sprung.

THE LATE EMPEROR OF CHINA.

THE announcement of a work by the late Dr Gutzlaff, entitled the *Life of Taou-Kwang, late Emperor of China, with Memoirs of the Court of Peking*,* excited a good deal of expectation; but for our own part, now that the book is published, we must confess our disappointment on finding it not a well-constructed memoir, but a volume bearing the appearance of a collection of materials put together just as they came to hand, with a view to re-arrangement. Declining health probably prevented the author from perfecting his plan, and hurried his pages to the press; death has now removed him from his labours. But a collection of authentic historic facts is valuable, however loosely embodied; and few writers have enjoyed such favourable opportunities as Dr Gutzlaff for obtaining them.

Referring first to the personal history of Taou-Kwang, we find that his education was more Tatar than Chinese. He was one of the numerous grandchildren of the imperial house of Keelung, but without any expectation of filling the throne, as both his mother and paternal grandmother were inferior members of the imperial harem. The discipline under which the royal family was trained, was of the strictest kind. Each of the male children, on completing his sixth year, was placed with the rest under a course of education superintended by the state. Though eminent doctors were engaged to instruct them in Chinese literature, yet archery and horsemanship were considered higher accomplishments, and the most expert masters from Mongolia and Manchouria trained them in these exercises. They were treated as mere school-

boys, were allotted a very small income for their maintenance, were closely confined to the apartments assigned to them, kept in entire ignorance of passing events, and allowed little intercourse with the court—none with the people. Not till each had passed his twentieth year, was there any relaxation of this discipline. Taou-Kwang was about this age when his father ascended the throne, in consequence of the somewhat capricious appointment of Keelung, who abdicated, and soon after died. The new emperor surrounded himself with buffoons, playactors, and boon-companions. The debaucheries, jealousies, and cruelties of his reign, remind us of what we have half sceptically read of Nero and Caligula. But Taou-Kwang kept aloof alike from the frivolities and the intrigues of his father's court: he seemed to have no desire ungratified so long as he had his bow and arrows, his horse and matchlock; and even after he was unexpectedly nominated heir to the throne, in consequence of having personally defended his father from a band of assassins, his new expectations made no difference in his frugal and modest way of life. The emperor at length died; it did not clearly appear by what means, and it would perhaps have been troublesome to inquire: the empress-dowager waived the claims of her son; and Taou-Kwang ascended the throne without bloodshed. The luxury of the preceding reign now gave place to sobriety and economy; though the usual ceremonies of the court were strictly observed, they were conducted in the least expensive manner; and the ruling passion of the monarch soon appeared to be avarice.

Taou-Kwang had no taste either for literature or the arts; and he jumbled together in one large magazine the beautiful pictures, clocks, and musical instruments accumulated by his ancestors. To explain and repair these, there had always been Europeans, chiefly Portuguese, in attendance; and to some of these we have been indebted in times past for memoirs of the court of Peking; but Taou-Kwang dismissed the last of them. It is believed that an undefined dread of Western power had much to do with this distaste for the products of its ingenuity.

The only orgies which the emperor seemed desirous of maintaining, were feasts for the promotion of Manchoo union; on which occasions, the Manchoes assembled to eat meat without rice—in order to maintain the recollection of their Nimrodic origin—and to drink an intoxicating liquor made of mare's milk. He had a favourite sequestered abode at no great distance from the capital, where he had allowed the vegetation to run wild and rank, in order to make it a rural retreat, instead of an imperial park. All business was excluded from the precincts, and here the emperor spent much of his time, wandering solitarily on foot among the trees, amusing himself with the friends of his youth, or sailing, with some of the ladies of his family, along the mimic rivers.

According to traditional usage, the monarch must perform a pilgrimage to the tombs of his ancestors. The astronomical, or rather astrological board having ascertained the month, the day, the hour, even the minute, when the stars would prove propitious, the cavalcade set out. The princes of the blood, the ladies of the palace, and the favourite ministers of the court, formed part of the train, which was attended by at least 2000 camels. But even an emperor cannot travel through waste and desert lands without inconvenience; and though great preparations had been made beforehand in erecting temporary dwellings where no villages were to be found, yet his Celestial majesty, with his court, had often to bivouac under tents in the open air. The people crowded in thousands to see their sovereign—a liberty which, it is well known, may not be used in Peking, where every one must hasten to hide his head as from the fabled Gorgon. The ancestral tombs at Mookden, where the imperial manes repose under

* London: Smith, Elder, & Co.: 1852.

care of a large garrison, were at length reached. And now Taou-Kwang became a family man, abandoning the forms of state and the pomp of empire, and mingling in familiar intercourse with his relatives and attendants. Such particulars prove that we must receive at very considerable discount the descriptions hitherto published concerning the extreme sacredness of the emperor's person, the monotonous routine of ceremony to which he is condemned, and the impossibility of his 'indulging in the least relaxation from the fatiguing support of his dignity.' Turn we now to public events.

By a series of unexpected conquests, the three largest empires in the world have been gradually approaching each other's frontiers in Asia. England, from the distant West, has formed military establishments bordering on Thibet; China, from the remote East, has come to take that country under its dominion; while Russia, the colossus of Europe, has traversed the ice-fields of Siberia, and furnished an extensive northern frontier to Mongolia and Manchouria, the Tatar dominions of China. These powers, by their combined influence, keep within bounds the lawless hordes of Asia, by whose frequent irruptions in past ages vast regions of more civilised territory were overwhelmed, and whole nations extirpated. The empire that effects most in this way is China, and that with the smallest amount of means. Its frontier army is indeed but a burlesque compared with the well-appointed warriors of England and Russia; yet the Usbecks, Calmucs, and Kinghis are kept in subjection. The volume before us gives some insight into the mode in which this is accomplished.

A formidable insurrection, excited partly by religious enthusiasm, broke out in the western parts of Chinese Tatory in 1826. An able leader was found in Tehangir, a descendant of one of the former princes. He proclaimed himself the deliverer of the faithful from the infidel yoke, drew multitudes to his standard, and proceeded victoriously from city to city. The imperial army sent to quell this insurrection cost on an average £23,000 of our money per day; and though victories were, as usual, reported, there was no appearance of the war coming to a termination. What prowess could not effect was accomplished by bribery. The Mohammedans were themselves divided into rival factions; and the Karatak ('black caps') were induced by Chinese diplomacy to turn against the Altkak ('white caps'), to whom Tehangir belonged. He was betrayed, taken to Peking, and cut to pieces in presence of the emperor; after which, nearly the whole of Turkistan was laid waste by fire and sword. After twenty more of the rebels had been decapitated, the emperor enacted new laws for the country, with the view of attaching the people to himself by the mildness of his rule. The black caps were promoted either to offices of trust in their own country, or to places of distinction in the Chinese army. When Turkistan again became the seat of trouble in 1830, the emperor at once sent 4000 camels with 2,000,000 taels of silver (about £700,000) to settle matters, which was considered much wiser than to engage in a long and expensive war. A similar policy was pursued in 1847, when a formidable rising occurred, during which Kashgar was taken, and the Manchoo forces routed. The Mohammedan leaders agreed to accept the emperor's bounty; and on condition of all lives being spared, the imperial troops were allowed to recapture Kashgar as by military force. A splendid victory was of course announced in the *Peking Gazette*; and in the subsequent distribution of rewards, the diplomatist was raised ten steps above the general.

It is commonly believed that the Celestial Empire dwells in perpetual peace within itself, as the fruit of that universal spirit of subordination and filial obedience which is the great object of all its institutions. Nothing, however, can be more erroneous. Not

only do the restless Tatars frequently break into revolt, but in China itself, the extortions of the mandarins, or the occurrence of famine, frequently excites a village, a city, or even a large district to rebellion; and there are cases of an infuriated population actually broiling their magistrates over a slow fire. The usual policy of Taou-Kwang in all such cases was to send an army, but at the same time to set the leaders at loggerheads by administering suitable bribes, and inducing them to betray each other. In this manner, a civil war can be brought to a speedy conclusion; and then the cruelty of the victorious government knows no bounds. 'The treatment of political prisoners,' says our author, 'is really so shocking as to be incredible, if one had not been an eye-witness of these inhuman deeds.'

The volume affords us some amusing particulars connected with the collision with England. When the British fleet was expected in the Chinese waters, the imperial orders were, to 'listen to no proposals, but fire on the ships, and annihilate them at once.' To the great emperor, it would have appeared quite ridiculous to condescend to negotiation with so inferior a power as Britain: he had given his orders; these must be obeyed; and his minister had himself written a letter to Queen Victoria, that she might not plead ignorance of the high behests of his Celestial majesty. It was not till the fleet appeared at the mouth of the Pei-Ho, and the capital was in danger, that Taou-Kwang deigned to seek an accommodation by means of his smooth-tongued minister Keshen, who negotiated an armistice, promising that all wrongs would be redressed by a commission appointed to meet the British representatives at Canton. But as soon as the fleet turned southward, the danger was considered visionary; and again the cry arose to punish the insolence of the Western barbarians, as the English were politely designated. The empress-dowager, who was never before known to meddle with state affairs, told her son that 'the English and Chinese could not co-exist under the canopy of heaven; that the Celestial Empire must assert its superiority over these barbarian robbers; and that unless he waged war to their utter extermination, his ancestors would never acknowledge him in Hades.' Keshen was now denounced as a traitor to his country for having come to any terms; he was sentenced to death; and though his execution was deferred, yet his whole property, amounting in silver alone to the value of three millions sterling, was confiscated; his very wives were sold by auction; and he who had been one of the richest men in the empire, had not the means of buying himself a jacket.

Elepoo, the imperial commissioner at Ning-poo, opposite Chusan, was also denounced. His crime was, that he had, according to the terms of the truce, surrendered the English prisoners, notwithstanding the counter-orders he had received to send them to Peking as trophies of victory, to be cut to pieces according to custom. Among them was a captain's wife, who had been wrecked, and had thus fallen into his power. A happy thought struck some of the mandarins—that she might be passed off as the sister of the barbarian Queen. She was accordingly put into a cage, and carried about for exhibition; but Elepoo delivered her from the excruciating death she would have suffered as Queen Victoria's sister, and restored her to her countrymen. The whole cabinet was indignant; he was summoned to appear immediately before his exasperated sovereign, and sentenced to transportation to the deserts of Manchouria.

When it came to fighting in earnest, and there was for the Chinese, as we know, nothing but utter defeat, still there was no report sent to court but of victory. But as million after million of taels vanished, and grandees after grandees disappeared, the emperor was obliged to be informed of the real state of affairs, and his wrath knew

no bounds. In vain he threatened utter destruction to the barbarians, if they did not instantly leave the coasts; in vain called on the people to arm themselves *en masse*, and protect their lives and property: no one stirred, and the emperor resorted to new counsellors for new plans of defence. It was now gravely proposed, to build a fleet three times as powerful as that of the British, and station it near Singapore and Anjeer, to intercept the British vessels ere they reached China, and annihilate their fleet piecemeal. The forests were to be felled to supply materials: the only thing wanting was some English men-of-war, to serve as models. Again, Houchunn, the Marshal Ney of China, was ready to face the whole British fleet if he had but a steamer to carry 6000 men, half divers, half gunners; the divers would jump into the water, and sink the English ships by boring large holes in them, while the gunners would keep up an incessant fire. Striking as this plan appeared, the emperor doubted its practicability. Imitation steamships had been attempted already; but though they looked quite like the foreign ones, they would not move: the paddles had to be turned like a treadmill. Another great suggestion, was to march 300,000 men right through the Russian territories to London, and put a stop to all further operations by crushing the English at home!

Meanwhile, the British arms prevailed; and when the fleet reached the first bend in the Yang-tse-kiang, there happened a solar eclipse; it was impossible not to see that the sun of China had set for ever!

When Taou-Kwang found that the danger actually threatened his throne and his person, he hastily packed up his effects, and prepared to fly to some of the interior provinces; but being assured that peace might yet be obtained, he gave *carte blanche* for its conclusion. 'One can form no adequate idea,' says Dr Gutzlaff, 'of the utter amazement of the Chinese on perceiving that the "son of heaven" was not invincible; and that he was even fallible; a revulsion of feeling took place, such as had never been known before; and the political supremacy which China had so proudly asserted, was humbled in the dust.'

As soon as peace was concluded, the first care of Taou-Kwang was to punish the champions who had clamoured for war, but proved cowards in the fight. Some had already died of grief, some had committed suicide, and others had fled. But those who remained within the monarch's grasp, besides many civil and military officers who had been compelled to surrender their cities, were treated with merciless severity. Keshen's extreme sentence was reversed, and he was made pipe-bearer to the emperor.

A new era had now commenced. It had been proved to a demonstration, that the mandarins were common mortals, and that the great emperor did not sway the whole world. Democratic assemblies rose in every part of the land; the people must be consulted where their happiness was concerned; the citizens and peasants turned politicians; and if in any case remonstrance failed, they proceeded, *en masse*, to the government offices, and carried by force what was denied to courtesy. The emperor learning these movements, instantly took the popular side; laid all the blame on the mandarins, and superseded those who had given offence. The taxes which had been refused, he remitted as an act of sovereign favour; and the laws were relaxed—often to the injury of well-disposed citizens. The people were again and again termed the dear children of the emperor, and every member of the cabinet found his best interest in advocating popular measures.

The rest of Taou-Kwang's reign was spent chiefly in endeavours to improve his naval and military forces, and in fruitless struggles to replenish the exhausted treasury of the state. His own, meanwhile, was full to overflowing, having received immense accessions from the confiscated property of his unsuccessful generals

and degraded ministers. He died on the 25th of February 1850, aged sixty-nine. In his will, there appears the following notice of the English war: 'The little fools beyond the Western Ocean were chastised and quelled by our troops, and peace was soon made; but we presumed not to vaunt our martial powers.'

A GLIMPSE OF BALLYVOURNEY.

AMONG the various plans that have been suggested for ameliorating the condition of Ireland, and improving the moral and social status of her people, I know of few better calculated to produce these beneficial results than that of opening good lines of road through wild and uncultivated districts, and by this means facilitating the intercourse between the inhabitants of almost unknown regions and those of more advanced and enlightened districts. Where this has been done, in conjunction with other local improvements, a moral regeneration has taken place that could scarcely be credited by those who have not witnessed the effect. In proof of what I say, I will endeavour to give a short account of a journey I made last summer from Cork to the far-famed Lakes of Killarney. I had performed the same journey several years before; but I now travelled, after passing Macroom, by a road that had been made since my last visit, through Ballyvourney, a wild and mountainous district, formerly impassable. The territorial improvements there are now matter of history, it having been proved before the Commissioners of Land Inquiry, that land, valued at 3s. 9d. per acre, had been made permanently worth L.4 per acre by a small outlay, which, with all expenses, rent, and interest of money, was repaid in three years.

The land had been deep turf (peat), and all but useless for agricultural purposes. By drainage, cultivation, and irrigation, however, it was made to produce the finest meadow grass, sold annually by public auction for from L.4 to L.6 per acre; and sometimes it yielded a second, and even a third crop. The great secret of this improvement was, that the then proprietor gave his steward, who was likewise his relation, a permanent interest in his outlay, by letting him the land on lease for ever. In consequence of his doing so, the very worst land, judging by the surface, has been made equal in value to town fields; and in the progress of this work, the wildest race perhaps in the world, have now become a civilised and industrious people. Mr C—— has sold his interest in the improvements for L.10,000, calculated, on the average profit of past years, at twenty years' purchase.

When he first undertook the work, he had every difficulty to contend with: the people were unused to labour, and so wild and savage, that no stranger dared to settle among them. I was told that when the first land-steward was seen at the chapel in a dress which denoted him to be a stranger, he heard a man behind him telling another in Irish—which he supposed to be unknown to the stranger—the part of his neck in which he would plant a deadly wound before he got home. The steward fortunately understood the native tongue, and quitting the chapel before the service was over, he fled from the dangerous place.

The present civilisation and industrious habits of the people, compared with their barbarism thirty years ago, shews that the Irish character, when properly directed, is as capable of advancement as any other in the world. There was at that time no road into

or out of Ballyvourney: it was in this respect like the Happy Valley. The passes are yet in existence, and are fearful to look at, where a gentleman from Kenmare, on his journeys to Cork, used to bring his chariot, accompanied by a number of footmen, and unharnessing the horses, let it down by ropes from the top of the precipice. There is another spot of the kind on the road from Killarney to Cahersiveen and Valentia, where on the side of the Hill of Droum, nearly precipitous from the sea, is the track-mark of the carriage-road, if such it can be called, where the vehicle used to be supported and dragged by men. A new road has since been made there: the Atlantic Ocean is so directly beneath, that a passenger may drop a stone into it as he drives along; while Droum Hill stands perpendicularly above him. It is a most magnificent scene; terminating with the ruins of Daniel O'Connell's birthplace. Visitors to Ireland usually conclude their journey at Killarney; but if they would continue their route to Caragh Lake, Blackstone, Lady Headley's improvements, and go on through the Pass of Droum to Valentia and Cahersiveen, they would discover that Killarney is only the opening to a scene of grandeur and sublimity.

Mr C—— found Ballyvourney in the inaccessible state I have described. The people held every year, on Whitsunday, a royal faction-fight; and for this, preparation was made almost every Sunday in the year. They fought with deadly weapons, sticks loaded with lead, and stones. Pensioners, who were accustomed to firearms, were hired for the occasion; but the weapon chiefly used was a short scythe, and men may still be found bearing its mark in contracted legs and arms: one man having Tim Haliy, his mark; another, Paddy Murphy, his mark, indelibly inscribed on his body. They had little or no agriculture—no wheeled cart, and scarcely even a spade. A crop of oats was a curiosity; and when there was such a thing, the only mode of conveying it to market was on a horse's back. Their agricultural operations were confined to feeding cattle, and they depended on their milk and butter for paying their rent, and purchasing the necessaries of life. Their mode of carrying butter to Cork was curious. I have often seen crowds of thirty, forty, or fifty men, seated on little ill-formed horses, which had two panniers swinging on the back, containing frequently only a single firkin of butter in one, and a stone in the other, the man being seated between. They fed their horses on the road-side, never entering an inn-yard; and they generally travelled by night. No one would trust another with his property; and on their journey of forty Irish miles, they expended no money. The scythe was their farming-implement to cut such coarse hay as grew in the bottoms near rivers. On Whitsunday, whoever could keep possession of a large stone called *Carrigun na Killeagh*, was champion for the year, and the party to which he belonged was triumphant until the next annual battle. On one occasion, the battle was almost ended, the champion was possessor of the stone for nearly the prescribed time; he gave one cheer of victory, then another, and was about to give the crowning cheer, when a signal was made to a pensioner, who had been hired for the purpose, and placed in ambush. He fired, and the ball pierced the conqueror's neck, without mortally wounding him. The man fell, and while on the ground, was seen pulling the moss and grass around him, and stuffing them into the wound, to prevent the flow of blood, that he might again mount the rock of victory. The next day he was seen out of doors by the doctor, for whom his wife had secretly sent; and after much entreaty, his determination not to allow the opposite party to know that he had been seriously hurt was overcome, and he permitted the doctor to examine the wound, and replace the styptics of his own providing with more scientific remedies.

Another story of the barbarism of the people was told me on my journey. A farmer's cow had momentarily trespassed on another man's land, one of a hostile faction. The farmer offered to pay for the damage, but the reply he received was a shot which killed him on the spot. His brother, who saw the catastrophe, ran to raise the victim; but the man had already reloaded his gun, and shot the brother dead. A third brother, having seen the two fall, ran to the succour so quickly, that the murderer had not time to complete the re-loading of his gun; and as a crowd was collecting, he ran off. Mr C—— used every exertion to have him taken, and for three years was unsuccessful; until obtaining the aid of a neighbour, a petty chieftain of a hostile clan, he at last succeeded. On the trial, one of the men who had witnessed the murders, and whom Mr C—— called to swear informations, denied the guilt of the accused, swore an *alibi*, and declared that he had on the day in question sold him a cow at a fair twenty miles distant. He was, however, convicted, and hanged on the spot where the murders were committed. By punishments of various kinds—transporting the most hardened, and sending others to the treadmill—the people were at length brought into some sort of order.

Tim Haliy was Mr C——'s right-hand man—his manager, sub-agent, &c.: he was rich in cows and sheep; and though rather advanced in life, he married a very young girl, who had a fortune of forty cows. By degrees, Tim grew careless, lost his office, and resolved henceforth to enjoy a life of luxury. His habits became deteriorated; and during the latter years of his life, a gallon of whisky was sent for daily to the public-house; and this was put into the milk-pails, and the cows milked into it. Upon this sustenance, Tim and his wife lived; they spent the whole day at home drinking, and were not known to use bread or animal food. As may be supposed, the cows soon came to the market one by one; and Tim and his wife, after years of misery, died in great indigence.

In the year 1822, Mr C—— commenced his local improvements. The first thing he did was to obtain the opening of a new line of road from Macroom to Killarney, and another to Kenmare. In the various works connected with these, the people first learned the use of the spade and shovel, and became inured to a continued day's work. There was now a possibility of carrying corn to market if grown, or of bringing it into the parish; and Mr C—— built a mill for grinding it. He also built an inn, and induced a coach-proprietor to run his coach from Cork to Killarney through Ballyvourney, it being a better line in distance, level, picturesque, and beautiful—far surpassing in every respect the old road by Millstreet. He gave sixty acres of land for a clergyman's glebe, built a house for him, and undertook—long previous to the late laws—the payment of the incumbent. The Board of First Fruits built a church, but were obliged during the work to have the protection of the military. In a very extensive culture of turnip and corn crops; in drainage on a large scale; in the building of capacious farm-offices; in planting the land not of an arable quality; and latterly, in the thinning of these plantations—all under the direction of a Scotch steward—almost unlimited employment was given; in addition to which, the establishment of a dispensary, the constant residence of a valuable clergyman, a station for police, and the intercourse carried on by the daily running of two public vehicles, have combined to render the inhabitants of Ballyvourney as industrious and civilised as those in any part of the British islands. They have become a quiet and peaceable race; a riot is never heard of among them; and the Stone of Victory has long been covered with lichen, moss, and grass. The people annually assemble at the Holy Well, and go their

rounds at the station; and the little image of St Gobnet, in the walls of an old church, is still looked on with adoration, and handkerchiefs thrown up to touch it, that they may bring healing virtue to the sick. The rector's residence is closely adjacent to the Holy Well, the station, and the image of St Gobnet, and the stone of victory within a few feet of his hall door. Yet he can go to bed at night without a lock to a door, or a bar to a window. Women and girls may be found in abundance who can thin and hoe turnips in the best manner. As good ploughmen and agriculturists in the various departments may now be had in Bally-vourney as in most places. All faction-fights are at an end; and although, little more than twenty years ago, these were the weekly Sabbath occupation, they are now like an item of an old almanac. By employing similar means, might not other parts of this naturally fine country be equally improved, and made the abode of a thriving and contented people?

THE DAUGHTER OF THE BARDI.

A TRUE OLD TALE.

THE Via dei Bardi is one of the most ancient streets of Florence. Long, dark, and narrow, it reaches from the extremity of the Ponte Rubaconte to the right of the Ponte Vecchio. Its old houses look decayed and squalid now; but in former days they were magnificent and orderly, full of all the state of those times, being the residences of many of the Florentine nobility. How many struggles of faction, how many scenes of civil war, have these old houses witnessed! for in the period of their splendour, Florence was torn by intestine feuds; from generation to generation, Guelphs and Ghibelines, Bianchi and Neri, handed down their bitter quarrels, private and personal animosity mingling with public or party spirit, and ending in many a dark and violent deed. These combatants are all sleeping now: the patriot, the banished citizen, the timid, the cruel—all, all are gone, and have left us only tales to read, or lessons to learn, if we can but use them. But we are not skilled to teach a lesson; we would rather tell a legend of those times, recalled to mind, especially at present, because it has been chosen as the subject of a fine picture recently finished by a Florentine artist, Benedetto Serrolino.

In the Via dei Bardi stood, probably still stands, the house inhabited by the chief of the great and noble family from whom it takes its name—we write of the period of the fiercest struggles between the Guelphs and Ghibelines; and the Bardi were powerful partisans of the latter party. In that house dwelt a young girl of uncommon beauty, and yet more uncommon character. An old writer thus describes her: 'To look on her was enchantment; her eyes called you to love her; her smile was like heaven; if you heard her speak, you were conquered. Her whole person was a miracle of beauty, and her deportment had a certain maidenly pride, springing from a pure heart and conscious integrity.'

From the troubled scenes she had witnessed, her mind had acquired composure and courage unusual with her sex, and it was of that high stamp that is prone to admire with enthusiasm all generous and self-devoting deeds. Such a being, however apt to inspire love, was not likely to be easily won; accordingly, the crowd of lovers who at first surrounded Dianora gradually dropped off, for they gained no favour. All were received with the same bright and beautiful smile, and

a gay, charming grace, which flattered no man's vanity; so they carried their homage to other shrines where it might be more prized, though by an inferior idol. And what felt Dianora when her votaries left her? We are not told; but not long after, you might see, if you walked along the street of the Bardi towards evening, a beautiful woman sitting near a balcony: a frame of embroidery is before her; but her eyes are oftener turned to the street than to the lilies she is working. It is Dianora. But surely it is not idle curiosity that bends her noble brow so often this way, and beams in her bright, speaking eyes, and sweet, kind smile. On whom is it turned, and why does her cheek flush so quickly? A youth of graceful and manly appearance is passing her window; his name is Hyppolito: he has long cherished the image of Dianora as Dante did that of his Beatrice. In loving her, he loved more ardently everything that is good and noble in the world; he shunned folly and idleness, and strove to make himself worthy of what he believed Dianora to be. At length, one of Cupid's emissaries—whether nurse or friend the chronicle does not tell—aided Hyppolito in meeting Dianora. One meeting succeeded another, till she gave him her heart, as such a true, young heart is given, with entire confidence, and a strength of feeling peculiar to herself. But what could they hope? Hyppolito's family were of the opposite party, and they knew it was vain to expect from them even a patient hearing; nor were the Bardi behind in proper feelings of hatred. What was to be done! There was but one Dianora—but one Hyppolito in the world; so have many wise young people thought of each other both before and since the days of the Ghibelines; but these two might be excused for thinking so, for many who saw them were of the same opinion. To part—what was the world to them if they were parted? Their station, their years, their tastes—so removed from noisy and frivolous pleasures—their virtuous characters, seemed to point out that they were born for each other. What divided them? One only point—the adverse political feelings of their families. Shall they sacrifice themselves to these? No. Thus reasoned Hyppolito; but we think the chronicles exaggerate the virtues of Dianora's character; for how many a girl unchronicled by fame has, before the still tribunal of her own sense of duty to God and her parents, sacrificed her dearest hopes rather than offend them; and this, with all her heroism, Dianora did not, but gave up all these dear early claims for her new love.

Delays were needless, for time could do nothing to smooth their path; so it was determined that Hyppolito should bring a ladder to Dianora's window, and, aided by their friend, they should find their way to a priest prepared to give them his blessing. The night appointed came—still and beautiful as heart could wish; the stars sparkling in the deep blue sky, bright as they may now be seen in that fair clime. Hyppolito has reached the house; he has fixed the ladder of ropes; there is no moon to betray him; in a minute, his light step will have reached the balcony. But there is a noise in the street, and lights approaching; the night-guard is passing; they have seen the ladder, for the street is narrow. Hyppolito is down, and tries to escape—in vain. They seize and drag him to prison. What was he doing there? What can he reply? That he meant to enter the house, to carry something from it, or commit some bad deed, cannot be denied. He will not betray Dianora; it would only be to separate them for ever, and leave her with a stained name. He yields to his fate; the proofs are irresistible, and, by the severe law of Florence at that period, Hyppolito

must die. All Florence is in amazement. So estimable a youth, to all outward appearance, to be in reality addicted to the basest crimes! Who could have believed it? But he confesses; there is no room for doubt. Pardon is implored by his afflicted friends; but no pardon can be granted for so flagrant a crime.

Hyppolito had one consolation—his father never doubted him; if he had, one glance of his son's clear though sad eye, and candid, open brow, would have reassured him. He saw there was a mystery, but he was sure it involved no guilt on Hyppolito's part. Hyppolito also believed that his good name would one day be cleared, and that his noble Dianora would in due time remove the stain that clouded it. He consented to die, rather than live separated from her. Yet poor Hyppolito was sorry to leave the world so young; and sadly, though calmly, he arranged his small possessions, for the benefit of those he loved, and of the poor, to whom he had always been a friend.

He slept quietly the night preceding the time fixed for his execution, and was early ready to take his place in the sad procession. Did no thought cross Hyppolito's clear mind, that he was throwing away, in weak passion, a life given to him by God for noble ends? We know not; but there he was—calm, firm, and serious. His only request was, that the procession might pass through the street of the Bardi, which some thought was a sign of penitence, an act of humiliation. The sad train moves on. An old man sitting at a door rises, strains his eyes to catch a last glimpse of Hyppolito, and then covers them in anguish, and sinks down again. This is an old man he had saved from misery and death. Two youths, hand in hand, are gazing with sad faces, and tears run down their cheeks. They are orphans: he had clothed and fed them. Hyppolito sees them, and even in that moment remembers it is he who deprives them of a protector: but it is too late to think now; for he is approaching the scene of his fault and the place of his punishment, and other feelings swell in his heart. His brows are contracted; his eyes bent on the house of the Bardi, as if they would pierce the stones of its walls; and now they are cast down, as though he would raise them no more on earth. But he starts, for he hears a loud shriek, a rushing, and an opening of the crowd: they seem to be awed by something that approaches. It is a woman, whose violent gestures defy opposition; she looks like a maniac just escaped from her keepers; she has reached Hyppolito; his fettered arms move as if they would receive her, but in vain. She turns to the crowd, and some among them recognise the modest and beautiful daughter of Bardi. She calls out: 'He is innocent of every crime but having loved me. To save me from shame, he has borne all this disgrace. And he is going to death; but you cannot kill him now. I tell you he is guiltless; and if he dies, I die with him.'

The people stand amazed. At last there is a shout: 'It must be true! he is innocent!' The execution is stopped till the truth is ascertained, and Dianora's statement is fully confirmed. And who shall paint the return from death to life of poor Hyppolito? and to such a life! for blazoned as the story of her love had been, Dianora's parents, considering also her firm character, subjected even the spirit of party to the voice of affection and reason; and Hyppolito's family, softened by sorrow, gladly embraced their Ghibeline daughter. Whether in after-life Hyppolito and Dianora were distinguished by the qualities they had shewn in youth, and whether the promise of affection was realised by time and intimate acquaintance, no chronicle remains to tell. This short glimpse of both is all that is snatched from oblivion—this alone stands out in bright relief, to shew us they once were; the rest is lost in the darkness of time.

The moment chosen by the artist is when Dianora

rushes from her house into the midst of the crowd, and reaches Hyppolito, surrounded by priests and soldiers. It is easy to see to what a varied expression of passion and action this point of the story gives rise.

A CURIOSITY IN NATURAL HISTORY.

THE crustacean class of animals, of which the lobster, crab, and shrimp are familiar examples, have this peculiarity of structure—that their soft bodies are enclosed within a coat-of-mail formed of carbonate and phosphate of lime. In fact, they carry their skeleton outside their bodies, both for defence of the vital parts within, and for the attachment of the muscles which move their limbs, and every part of their frame. No warrior of old was ever more completely enveloped in his hard coat-of-mail, with its jointed greaves and overlapping scales, than is the lobster in its crustaceous covering; with this exception, that the warrior could at pleasure unbuckle himself from his armour, whereas the body and limbs of the crustacea are completely incased in hollow cylinders, firmly and accurately jointed, from which there is no such ready release. Now, as this shelly integument envelops them from their earliest youth, and as it does not expand and grow, the natural growth of the soft body beneath would be entirely prevented did not nature supply a remedy of a very curious kind—the exuviation, or periodical throwing off of the external crust, and the formation of a larger shell-covering fitted for the increasing growth of the animal. This is a circumstance which has long been familiar to naturalists, and indeed the most ordinary observer must have often remarked in the crabs and lobsters brought to table, appearances indicative of their change of external coverings. In the back of the edible crab, may often be noticed a red membrane lining the inner side of the shell, but so loose as to be readily detached. Along the greater part of its course this membrane has already assumed a half-crustaceous consistence, and is just the preparatory process to the old shell being thrown off by the animal. There is another curious circumstance which has also been long known—that crabs and lobsters can renew lost limbs. Some misconception, however, had existed regarding the manner in which this was effected, until the observations of the late Sir John Dalyell have thrown more accurate light on the subject.

This most amiable and eminent zoologist, who was lost to science last year, afforded a pleasing illustration of the solace and delight which the pursuit of the study of nature yields to the diligent inquirer into her mysteries. With a feeble constitution and frame of body, which precluded his mingling in the more active pursuits of everyday life, this sedentary philosopher collected around him examples of minute and curious being from the depths of the ocean, from lake and river, and for many long years found the delight of his leisure hours in watching the habits of the animals, and in discovering and describing many singular circumstances in the constitution of their bodies, and the peculiar adaptations of their structure and instincts to their modes of existence. One of his last communications to the public, imparted with all the modesty and simplicity of true genius, at the last meeting of the British Association in Edinburgh, was on this subject of the exuviation of the crustacea.*

It appears from Sir John's observations that crustaceans begin to throw off their shells at a very early period of their life, even in that embryo state in which they first appear after having left the egg, and before they have yet assumed the real form of their mature state. During every successive exuviation in this embryo state, they assume more and more of their perfect and established form. While the crab is young

* Report of British Association, 1851. Pp. 120-122.

and rapidly growing, frequent exuviations take place at short intervals, from three to five times in the course of one year. Previous to the change, the animal almost ceases to feed, and becomes rather inactive; the proper time having at length arrived, exuviation is effected in the course of a few hours, body and limbs being alike relieved from their hard covering. Until the new shell acquires firmness and strength, the creature is very shy, and in the state of nature, retires into cavities below rocks or heaps of protecting sea-weed. Sir John had kept for some time one of our smaller species of shore-crabs (*Carcinus monas*), of medium size, of a brown colour, with one white limb. One summer evening it was put outside the window in a capacious glass-vessel of sea-water. In the morning a form exactly resembling its own, only somewhat larger, lay in the vessel. This was the same animal, which had performed exuviation, and extricated itself from the old shell during the night. The resemblance between both forms was complete—everything was the same, even the white limb was seen in both. Another specimen kept was of smaller size, the opposite extremities of the limbs being only thirteen lines asunder; its colour was green, with three white patches on the back. In the course of little more than a year five exuviations took place at irregular intervals, the new shell and animal becoming larger each time. The third shell came on uniformly green, the white spots being entirely obliterated. On the fourth exuviation, the limbs expanded two inches and a half. From the long slender form of the limbs of crustacea, they are very liable to mutilation. Crabs are also a very pugnacious family, and in their battles limbs are often snapped off. These mutilations, however, are readily repaired; although, contrary to what was the common belief, the restoration takes place only at the next regular period of exuviation.

The full-grown common crab (*Cancer pagurus*) is of a reddish-brown colour, the claws tipped black; but some of the young are naturally of the purest white, which remains long unsullied. This does not arise from confinement, which, according to Sir John, has no influence on colour. 'A young white specimen of the common crab was subjected to observation on 29th September. The body might have been circumscribed in a circle three-quarters of an inch in diameter, and the extended limbs by one-and-a-half inch in diameter. Its first exuviation ensued on 8th November, the second on the 30th of April following, and the shell then produced subsisted till 12th September, when another exuviation took place, introducing a new shell of such transparent white that the interior almost shone through it. All the shells were white, and increased somewhat in size successively. This last shell of 12th September subsisted until 29th March, being 197 days, when it was thrown off during another exuviation.'

But what was remarkable, the animal now had only the two large claws, the other eight limbs were deficient. 'Resting on its breast as it was, I did not at first discover the fact, that the creature presented a strange and very uncouth aspect. However, it fed readily, and proved very tame, though helpless; often falling on its back, and not being able to recover itself from the deficiency of its limbs. I preserved this mutilated object with uncommon care, watching it almost incessantly day and night: expecting another exuviation which might be attended with interesting consequences, I felt much anxiety for its survivance. My solicitude was not vain. After the defective shell had subsisted eighty-six days, its tenant meantime feeding readily, the desired event took place in a new exuviation on 23d June. On this occasion a new animal came forth, and in the highest perfection, quite entire and symmetrical, with all the ten limbs peculiar to its race, and of the purest and most beautiful white. I could not contemplate such a specimen of nature's energies restoring

perfection, and through a process so extraordinary, without admiration. Something yet remained to be established: was this perfection permanent, or was it only temporary? Like its precursor, this specimen was quite tame, healthy, and vigorous. In 102 days it underwent exuviation, when it appeared again, perfect as before, with a shell of snowy white, and a little red speckling on the limbs. Finally, its shell having subsisted 189 days, was succeeded by another of equal beauty and perfection, the speckling on the legs somewhat increased. As all the shells had gradually augmented, so was this larger than the others. The extended limbs would have occupied a circle of four inches diameter. About a month after this exuviation the animal perished accidentally, having been two years and eight months under examination. It was an interesting specimen, extremely tame and tranquil, always coming to the side of the vessel as I approached, and holding up its little claws as if supplicating food.'

The shrimp when in confinement becomes very tame, and readily exuviates. The process is frequent, the integument separates entire, and is almost colourless. In female crustaceans the roe is placed outside the shell to which it adheres. During the period of such adherence, the female crab, so far as observation goes, does not change its shell—a marked provision of nature to preserve the spawn.

We may remark that other classes of animals exuviate in a similar manner to the crustaceans. Thus serpents throw off in entire masses their scaly coverings, even a slough from the eyes; and various insects in their larva state are continually throwing off and renewing their skins.

THE AYAH.

Owing to our constant intercourse with India, there are few among us who are unacquainted with the word ayah. Some who live in London or its neighbourhood may perhaps have occasionally met with one of these sable guardian spirits, conducting one or more pale, precocious-looking little children to their British friends; or they may even have fallen in with a group of the tribe in Kensington Gardens, or other public promenades, escorting their little *bábás*, and herding together, like birds of a feather, attracted by the bonds and recollections of colour, climate, caste, and language.

Ayah, in the mouth of a lisping baby, is one of the prettiest words of the East, and is learned as soon as papa and mamma, being equally easy of articulation. The origin of the word is probably either Portuguese or Spanish (*aya*), although it has now become common to all classes, Christians, Mohammedans, and Hindoos alike. The Hindostanee word for nurse is *māmā-jee*, or *daee*; the Bengalee, *doodoo*, or *dye*.

The ayah is frequently a fixture of long standing in a family, descending from mother to daughter; and when this is the case, she is no doubt a valuable possession, and is consulted in all the momentous matters connected with the nursery. However, at the birth of the first baby, she is of course spick-and-span new; and in comes the dusky stranger, all pride and expectation, all hope and joy. It is fortunate that there is no difference in young babies—that the one is as ugly a little thing as the other—and so she is not disappointed: on the contrary, she sees with one glance of her dark glittering eyes, which have their source of sensation in her woman's heart, a thousand charms that distinguish her *bābā* from all the other babies in the universe. With something akin to a mother's feelings, she takes the infant in her arms, which seems incongruous to become a part of herself, lying all day on her

knees, and sleeping all night in her bosom; and from that moment the nurse, the child, and the paun-box are always together.

As the ayah is exclusively attached to the nursery, and has nothing to do with household affairs or the laying out of money, she is generally a favourite with the other servants, who seem to look upon her as holding an intermediate station between them and the mistress. Should any of them require leave of absence, for the purpose of attending a funeral or a wedding, he applies first to the ayah; or if a little tea is wanted for a sick wife or mother, through her also he obtains the simple, though to him expensive, restorative. If a pedler comes to the door with his box and bundles, he looks up, and spying the ayah in the veranda or at the window, he calls out: 'Is anything wanted for Mem-Sahib or the bábás? Tell the lady I have beautiful things to shew.' Away trips the ayah to her mistress, and good-naturedly, or perhaps—no, it shall be good-naturedly—lays the discovery before her that some trifle is wanted. The man is called in, and succeeds in disposing of some of his wares, ribbons, laces, or silks; and the ayah, besides having obliged the lady and the pedler, enjoys a small modicum of satisfaction herself—who would grudge it?—in pocketing the *dastóree*—a discount of two pice, or half an anna on each rupee.

There are ayahs of various castes. The Portuguese ayahs (Roman Catholic Christians, born in the country) are no doubt the most intelligent and useful; but they are more expensive than the Mussulman and Lall Beggies, and are therefore not so frequently employed: indeed, it is only in the neighbourhood of Calcutta that they are procurable at all. As the Hindostanee women neither knit nor sew, they seem to devote their energies exclusively to their infant charge. The bábá is their work and their play, the exercise of their thoughts, the substance of their dreams. He is the only book they read; and the only expansion their minds know is from the unfolding of the pages of his character. They are proud of that bábá, and proud of themselves for being his. What a sight it is, the ayah coming in at the dessert, in her rustling silks and transparent muslins—so stately in her humility, so smilingly self-satisfied—surrounded by the children, and holding in her dark, smooth, jewelled arms the son and heir of the family, whom she presents to papa to get a bit of cake or sweetmeat!

This is a grand moment for the ayah. Are not the children *hers*? Have they not lain upon her bosom all their little lives? And have not the charms which she detected with the first glance of her glittering eye, been developed under her care into the marvels now before the company? But the more tranquil and permanent happiness of the ayah is enjoyed while she is watching alone the opening of her buds of beauty, and steeping their slumbering senses in the sweet wild music of her country. I still sometimes hear in fancy her cradle-song humming in my own Old Indian ear as I am falling asleep—although many a long year has passed since I heard it in reality, and many a long league is now between me and the land of the dear, good, black, comical, kindly ayah. Let me try whether I cannot render it, even loosely, in our own strong Anglo-Saxon tongue, from the musical, melting Hindostanee:—

Sleep on, sleep on, my bábá dear!
Thy faithful slave is watching near.
The cradle wherein my babe I fondle,
Is made of the rare and bright-red sandal;*
And the string with which I am rocking my lord,
Is a gay and glittering silken cord.

Sleep on, sleep on, my bábá dear!
Thy faithful slave is watching near.
Thy father, my dear, is the jemadar
Of a province which stretches wide and far;
And his brother, my child, is a moonsif great,
Who ruleth o'er many a ryot's fate.

Sleep on, sleep on, my bábá dear!
Thy faithful slave is watching near.
Thy mother of hearts is the powerful queen,
The loveliest lady that ever was seen;
And there ne'er was slave more faithful, I trow,
Than she who is rocking thy cradle now.

I have said that our ayah sometimes comes home with her charges—comes to our home from her own. It is a bad exchange. She awakes slowly from her dream, as she sees the rosy cheeks, full pouting lips, and round wondering eyes, that are turned upon the dark stranger and her pale, thin, little ones. The comparison is painful; these cherub children have no sympathy with the lonely Hindoo; and the servants of the house, although awed at first by her foreign aspect, and calm, stately air, have no permanent respect for one who ranks neither with their superiors nor with themselves. The climate, too, is as chilling as the manners around her; her heretofore bábás are lords to nobody but herself; and so, with one thing and another, she grows home-sick, her heart yearns for her own sunny land, and she is glad—sorrowfully glad—when at last the announcement is made, that an ayah wants to go back to India with a family.

And in India once more, what then? Why then, the great ocean is between her and her fledged nurslings, and she looks round for some new objects of love and devotion. These she probably finds in another home, another mistress, another bábá; her heart begins its course anew; and the ayah lives a second life in the young lives of her children. No joyless existence is hers, no cares without ample compensations; but yet when I see in my own country one of these solitary, strangely-attired, dark-skinned women, I feel attracted towards her by an almost tearful sympathy, and have ever a kind look and a warm, gentle word for the poor ayah.

SMALL INVESTMENTS.

The investment of small savings in land with a view to spade-husbandry, was a few years ago brought prominently before the working-classes. We took occasion, at the time, to warn the humbler classes generally against projects of this kind, but without any beneficial effect. Land-schemes, as they were called, were puffed into popularity, and all our advices and remonstrances on the subject were rejected with disdain. Universal ruin has followed these schemes, and the unfortunate dupes are left to mourn their loss. Nothing is more specious than a plan of earning an independent livelihood by cultivating a few acres of land; but, practically, it is open to some serious drawbacks. First, the cultivator requires to be skilled in husbandry, and of a bodily frame to endure the fatigue of constant out-door labour. Second, his land must be tolerably good, and situated under a good climate. Third, the land must be close to a market, otherwise the produce cannot be disposed of. The cultivation of a small bit of land is in reality a kind of gardening. No horse-labour can be employed; all is to be done by the spade. It may be possible, therefore, to make a livelihood near a large town, where anything that is produced—milk and butter included—will find a ready market at no cost of transport; but in other circumstances the thing is almost hopeless. It

*The red sandal-wood is more rare and valuable than the yellow.

is a notorious fact, that the most wretched of the rural population of this country are small cultivators, even if the land costs next to nothing. We are aware that the small-farm system is more successful in Belgium and Lombardy. On the reasons for this, it is here needless to enter. We take the examples offered in Great Britain, where it has never come up to the expectations of philanthropists.

The purchase of forty-shilling freeholds has lately been put forward as a method of investing money by the working-classes. It is beyond our province to speak of the political aims of this form of investment. We can recognise a certain good in giving to a working-man the feeling, that he is the proprietor of a house or small portion of land yielding (along with the franchise in England) a rent of forty shillings per annum; but, at the same time, we recognise a corresponding evil, and we should be shrinking from our duty if we did not mention it in distinct terms. In those localities where operatives and others can reckon on constant remunerative employment, it may prove a real service in many ways for them to buy a house instead of renting one; indeed, we should highly recommend them to become the proprietors of the dwellings which they occupy. But in places where workmen possess no such assurance or reasonable prospect of employment, we would as earnestly dissuade them from taking a step of this kind. The capital of a working-man—that on which he must place his dependence—is his labour; and this labour he ought to be in a position to dispose of to the best advantage. On this account, he requires, as a general rule, to hold himself in readiness to go wherever his labour is in demand. Of all men, he has the most cause to be a citizen of the world. He may find it his interest to remove to localities hundreds of miles off; and therefore the fewer obstructions to his movements, the better. Heritable property is a fixture. A man cannot take it with him, and the sale of it, even when time is permitted to seek out a purchaser, is attended with expense and difficulty. No doubt the transfer of such property might and ought to be vastly lowered in cost; but not until this is done, will it be time for the more movable part of the working-classes to consider the propriety of saddling themselves with the ownership of lands and houses. Such, at least, is our opinion, after much consideration of the subject. So many melancholy instances have we seen of working-men being ruined by the want of power or will to leave small heritable possessions in country towns, where employment deserted them, that we entertain a strong feeling against this class of persons investing their earnings in fixed property.

Upon the whole, the best thing the humbler classes can do with small savings, is to let them accumulate as movable capital. They should perceive that, generally speaking, a little money has few advantageous outlets. It is only after its increase to a tolerable sum, that it can command a good investment. A short time ago, we adverted to the vast benefits that would accrue to the working-classes, by legalising partnerships in commandite; for this would allow the clubbing of means for trading purposes without chance of total loss. Another thing for improving the resources of such classes, would be the issue of small debentures on land, railways, and other kinds of property; these debentures to be registered in such a manner as would admit of legal recourse without the

tedious and expensive forms now required to enforce their liquidation. These, then, are things to be struggled for by the humbler orders, indeed by many who ostensibly belong to classes higher in social standing.

PLEASURES OF LITERATURE.

It may be remembered, that somewhat more than two years ago, Mr Willmott's *Journal of Summer-time in the Country* was noticed in these pages. Those who, through that or any other introduction, have since become acquainted with that exquisite little volume, will be glad to meet the author again, in the not less charming work which he has recently put forth, on the *Pleasures, Objects, and Advantages of Literature*.* The theme itself must be naturally attractive to all book-loving people; and we are prepared to say, that it is treated with felicity and discrimination. We do not aver that we always concur in the writer's judgments, or hold precisely his views of criticism; but we are, upon the whole, very decidedly impressed with the general force and truth of his Discourse, with the gracefulness of his allusions and illustrations, his elegant and pointed style, and the bland and genial temper in which he writes. The work consists of a series of short chapters on books, authors, the circumstances in which they wrote, the moods in which they should be read to be appreciated, the nature and specific qualities of taste, poetry, fiction, the drama, history, and philosophy. The author's turn of mind is chiefly retrospective: he writes more in the spirit of the last age than of the present. Indeed, he seems too much inclined to ignore the value of our later literature; almost the only modern authors whom he quotes are Hallam, Charles Lamb, and Southey; and it is evident, both from the style and matter of the work, that the range of his reading has been most extensive in what he terms the 'classical criticism and biography of the eighteenth century.' This, however, we note only in passing; and not at all in the way of condemnation; further than as it may indicate the limitations to be expected in his tone of thought and sentiment.

Mr Willmott, indeed, speaks disparagingly of some of the severer studies—especially of logic and mathematics; declaring that they 'can only be useful to a full mind,' and that, 'if they find it empty, they leave it in the same state.' Of course, he may be allowed to have his opinion on such a matter; but we presume it will not be very generally adopted. We agree with him that, 'in moral impression they are powerless;' yet we are bound to bear in mind that their aim is not a moral one; and we, furthermore, believe that, within their own scope and province, they may at least be serviceable in training and developing the understanding. Not to dwell longer on this little eccentricity of opinion, which is simply one of idiosyncrasy, let us follow the author into some of the more congenial sections of his dissertation. The following passage, on 'The three essential qualities of an author,' seems not unsuitable for quotation:—

'Sir Philip Sidney said, that the most flying wits must have three wings—art, meditation, exercise. Genius is in the instinct of flight. A boy came to Mozart, wishing to compose something, and inquiring the way to begin. Mozart told him to wait. "You composed much earlier?" "But asked nothing about it," replied the musician. Cowper expressed the same sentiment to a friend: "Nature gives men a bias to their respective pursuits, and that strong propensity, I suppose, is what we mean by genius." M. Angelo is hindered in his childish studies of art; Raffaele grows up with pencil and colours for playthings: one neglects school to copy drawings, which he dared not bring home; the

* *Pleasures, Objects, and Advantages of Literature. A Discourse, by the Rev. Robert Aris Willmott, Incumbent of Bear Wood, Berks. Bowditch: London.*

father of the other takes a journey to find his son a worthier teacher. M. Angelo forces his way; Raffaele is guided into it. But each looks for it with longing eyes. In some way or other, the man is tracked in the little footsteps of the child. Dryden marks the three steps of progress:—

"What the child admired,
The youth *endeavour'd*, and the man *acquired*."

'Dryden was an example of his own theory. He read Polybius, with a notion of his historic exactness, before he was ten years old. Witnesses rise over the whole field of learning. Pope, at twelve, feasted his eyes in the picture-galleries of Spenser. Murillo filled the margin of his school-books with drawings. Le Brun, in the beginning of childhood, drew with a piece of charcoal on the walls of the house. The young Ariosto quietly watched the fierce gestures of his father, forgetting his displeasure in the joy of copying from life, into a comedy he was writing, the manner and speech of an old man enraged with his son.

'Cowley, in the history of his own mind, shews the influence of boyish fancies upon later life. He compares them to letters cut in the bark of a young tree, which grow and widen with it. We are not surprised to hear from a school-fellow of the Chancellor Somers, that he was a weakly boy, who always had a book in his hand, and never looked up at the play of his companions; to learn from his affectionate biographer, that Hammond at Eton sought opportunities of stealing away to say his prayers; to read that Tournefort forsook his college class, that he might search for plants in the neighbouring fields; or that Smeaton, in petticoats, was discovered on the top of his father's barn, in the act of fixing the model of a windmill which he had constructed. These early traits of character are such as we expect to find in the cultivated lawyer, who turned the eyes of his age upon Milton; in the Christian, whose life was one varied strain of devout praise; in the naturalist, who enriched science by his discoveries; and in the engineer, who built the Eddystone Lighthouse.'

This accords very well with a notion of our own. We hold that men have a tendency to follow what they are by nature best qualified to succeed in; and that the fact ought to be regarded in the education of the individual. Education should include the study and trial of aptitudes, so that each may be directed to his appropriate vocation. It is true, there are sometimes such things as 'false tendencies' to be encountered; but these, as Goethe has shewn, may be readily detected, inasmuch as they are plainly 'unproductive'; that is to say, the thing aimed after does not come out as a recognisable success. False tendencies are more easily perceived in others than in ourselves—especially when ambition, interest, or vanity is involved in the consideration; and on this account the difficulty, perhaps, might not be insurmountable, if the charge of it could be committed to a really judicious educator. But to say anything further on the subject would be out of place at present; and, accordingly, we return to what is more immediately before us.

'The instinct of flight,' continues our author, 'is combined with the instinct of labour. Genius lights its own fire; but it is constantly collecting materials to keep alive the flame. When a new publication was suggested to Addison, after the completion of the *Guardian*, he answered: 'I must now take some time, *pour me delasser*, and lay in fuel for a future work.' The strongest blaze soon goes out when a man always blows and never feeds it. Johnson declined an introduction to a popular author with the remark, that he did not desire to converse with a person who had written more than he had read.

'It is interesting to follow great authors or painters in their careful training and accomplishing of the mind.

The long morning of life is spent in making the weapons and the armour which manhood and age are to polish and prove. Usher, when nearly twenty years old, formed the daring resolution of reading all the Greek and Latin fathers, and with the dawn of his thirty-ninth year he completed the task. Hammond, at Oxford, gave thirteen hours of the day to philosophy and classical literature, wrote commentaries on all, and compiled indexes for his own use.

'With these calls to industry in our ears, we are not to be deaf to the deep saying of Lord Brooke, the friend of Sidney, that some men overbuild their nature with books. The motion of our thoughts is impeded by too heavy a burden; and the mind, like the body, is strengthened more by the warmth of exercise than of clothes. When Buffon and Hogarth pronounced genius to be nothing but labour and patience, they forgot history and themselves. The instinct must be in the mind, and the fire be ready to fall. Toil alone would not have produced the *Paradise Lost* or the *Principia*. The born dwarf never grows to the middle size. Rousseau tells a story of a painter's servant, who resolved to be the rival or the conqueror of his master. He abandoned his livery to live by his pencil; but instead of the Louvre, he stopped at a sign-post. Mere learning is only a compiler, and does with the pen what the compositor does with the type: each sets up a book with the hand. Stone-masons collected the dome of St Paul's, but Wren hung it in air.'

There is, perhaps, nothing very profound or original in this, but it is all very sensible and pleasant. Something of novelty, however, will be observed in the extract which follows next, on 'The Influence of Air and Situation on the Thoughts.' The consideration, at any rate, is curious, both under its physiological and metaphysical aspect.

'It has been a subject of ingenious speculation if country or weather may be said to cherish or check intellectual growth. Jeremy Collier considered that the understanding needs a kind climate for its health, and that a reader of nice observation might ascertain from the book in what latitude, season, or circumstances, it had been written. The opponents are powerful. Reynolds ridiculed the notion of thoughts shooting forth with greater vigour at the summer solstice or the equinox; Johnson called it a fantastic foppery.

'The atmospheric theory is as old as Homer. Its laureate is Montesquieu. The more northerly you go, he said, the sterner the man grows. You must scorch a Muscovite to make him feel. Gray was a convert. One of the prose hints for his noble fragment of a didactic poem runs thus: 'It is the proper work of education and government united, to redress the faults that arise from the soil and air.' Berkeley entertained the same feeling. Writing to Pope from Leghorn, and alluding to some half-formed design he had heard him mention of visiting Italy, he continues: "What might we not expect from a muse that sings so well in the bleak climate of England, if she felt the same warm sun, and breathed the same air with Virgil and Horace?"

'When Dyer attributes the faults of his *Fleece* to the Lincolnshire fens, he only awakes a smile. Keats wrote his Ode to a Nightingale—a poem full of the sweet south—at the foot of Highgate Hill. But we have the remark of Dryden—probably the result of his own experience—that a cloudy day is able to alter the thoughts of a man; and, generally, the air we breathe, and the objects we see, have a secret influence upon our imagination. Burke was certain that Milton composed *Il Penseroso* in the long, resounding aisle of a mouldering cloister, or ivied abbey. He beheld its solemn gloom in the verse. The fine nerves of the mind are braced, and the strings of the harp are tuned, by different kinds of temperature. "I think," Warburton remarked to Hurd, "you have often heard me say, that my delicious season is the autumn—the season which gives most life and

vigour to my intellectual faculties. The light mists, or, as Milton calls them, the steams that rise from the fields in one of these mornings, give the same relief to the views that the blue of the plum gives to the appetite."

'Mozart composed, whenever he had the opportunity, in the soft air of fine weather. His *Don Giovanni* and the *Requiem* were written in a bowling-green and a garden. Chatterton found a full moon favourable to poetic invention, and he often sat up all night to enjoy its solemn shining. Winter-time was most agreeable to Crabbe. He delighted in a heavy fall of snow; and it was during a severe storm which blocked him within doors, that he portrayed the strange miseries of Sir Eustace Grey.'

There may be something in this supposed influence of temperature and seasons; but there certainly is no general law observable in the matter. Shakespeare asks—

'Oh who can take a fire in his hand
By thinking of the frosty Caucasus?
Or wallow naked in December's snows
By bare remembrance of the summer's heat?'

He might have been answered by Moore, who shut himself up in the wintry wilds of Derbyshire to write *Lalla Rookh*—a poem breathing of the perfumes, and glowing in the sunlight of the golden East; and by Scott, who, in Jermyn Street, St James's, with miles of brick houses round him, produced his famous introductions to *Marmion*, some of which may rank with the finest descriptions of natural scenery in the language. But the way in which people are influenced seems utterly capricious. We know a writer who is always unfavourably affected by a dull, still atmosphere, and whose faculties are as invariably exhilarated by a high wind. Cloudy weather does not influence him disagreeably if it be stormy, but calm, leaden November glooms oppress him with a feeling bordering upon stupor. These are altogether unproductive days with him. If authors, however, are subject in their moods to atmospheric and other circumstantial influences, it may be expected that readers also are to some extent possessed of a like tendency. Mr Willmott has, accordingly, a suitable suggestive word or two to guide them in their reading. He says:—

'A classification of authors to suit all hours and weathers might be amusing. Ariosto spans a wet afternoon like a rainbow. North winds and sleet agree with Junius. The visionary tombs of Dante glimmer into awfuller perspective by moonlight. Crabbe is never so pleasing as on the hot shingle, when we look up from his verses at the sleepy sea, and count the

"Crimson weeds, which spreading slow,
Or lie like pictures on the sand below:
With all those bright red pebbles, that the sun
Through the small waves so softly shines upon."

'Some books come in with lanips and curtains, and fresh logs. An evening in late autumn, when there is no moon, and the boughs toss like foam raking its way back down a pebbly shore, is just the time for *Undine*. A voyage is read with deepest interest in winter, while the hail dashes against the window. Southey speaks of this delight—

"This pleasant by the cheerful hearth to hear
Of tempests and the dangers of the deep,
And pause at times and feel that we are safe;
And with an eager and suspended soul,
Woo terror to delight us."

'The sobs of the storm are musical chimes for a ghost-story, or one of those fearful tales with which the blind fiddler in *Redgauntlet* made "the auld carlines shake on the settle, and the bits of bairns skirl on their minnies out frae their beds."

'Shakespeare is always most welcome at the chimney-corner; so is Goldsmith: who does not wish Dr

Primrose to call in the evening, and Olivia to preside at the urn? Elia affirms, that there is no such thing as reading or writing, but by a candle; he is confident that Milton composed the morning hymn of Eden with a clear fire burning in the room; and in Taylor's gorgeous description of sunrise, he found the smell of the lamp quite overpowering. . . . But Elia, he says further on, 'carried his fireside theory too far. Some people have tried "the affection of a book at noonday in gardens and sultry arbours," without finding their task of love to be unlearned. Indeed, many books belong to sunshine, and should be read out of doors. Clover, violets, and hedge-roses, breathe from their leaves; they are most lovable in cool lanes, along field-paths, or upon stilts overhung by hawthorn; while the black-bird pipes, and the nightingale bathes its brown feathers in the twilight cope.

'The sensation is heightened when an author is read amid the scenery or the manners which he describes—as Barrow studied the sermons of Chrysostom in his own see of Constantinople. What daisies sprinkle the walks of Cowper, if we take his *Task* for a companion through the lanes of Weston! Under the thick hedges of Horton, darkening either bank of the field in the September moonlight, *Il Penseroso* is still more pensive. And whoever would feel at his heart the deep pathos of Collins's lamentation for Thomson, must murmur it to himself, as he glides upon the stealing wave, by the breezy lawns and elms of Richmond.'

Our author has some judicious remarks on 'Criticism, its Curiosities and Researches,' and is himself a critic of refined and delicate appreciation. We certainly do not agree with him in thinking that the literature of the last century is superior to that of the present; but we can nevertheless admit that many of his favourite writers are deserving of a higher and more reverent regard than is now generally awarded them. We would quarrel with no man about his preferences; still, we cannot hold Mr Willmott justified in such sweeping condemnation of our current literature as he appears disposed to pass upon it. It would seem, indeed, that in his disgust at 'the corrupted streams of popular entertainment,' he has not cared to make himself acquainted with the best of our modern writers. Of these he seems—if we may judge from his total oversight of them—to have hardly a knowledge of the names. 'He lives,' as he admits, 'among the society of an elder age.' Here, however, he numbers 'tasteful learning with the chiefest blessings of his home.' If he had lived in the last century, he would probably have gone back for his idols to an earlier one; and yet his remarks on taste and criticism are of a catholic nature, although his just application of their canons have this chronological boundary. We have no room, however, for his disquisition on these elegant subjects; neither can we follow our accomplished clergyman into his disquisitions on fiction, history, biography, philosophy, and its pleasures, nor the 'domestic interiors' of taste and learning. We had intended to quote some fine sentences on the consolations of poetry, but find we have not room for them. The reader will do well to get the book, and read them there. It is a work altogether well worth reading. Nay, it will bear reading many times, and even become pleasanter as one's acquaintance with it increases. Indeed, it is not at all the kind of book to be run through rapidly, and so disposed of; the thought and observation in it are closely packed and methodised; and if you wish to derive any benefit, or even pleasure from the perusal, you will need to read deliberately. We should say the author thoroughly enjoyed his work while he was engaged in it; but the workmanship exhibits everywhere the greatest care and patience. The same habit of mind employed in writing it will be required in the reading. We may describe the book as being a graceful, suggestive review of literature, considered with regard

to its enjoyments. Refined, scholarly, tolerant, and judicious in all his tastes and sympathies, the author's influence upon other minds cannot be otherwise than wholesome, elevating, and benignant.

THE MISSING SHIP.

ALEXIS HIMKOF had just taken an affectionate leave of his wife, and stood looking after her, on the deck of the vessel to which he had been appointed mate, and which had been fitted up for the whale-fishery near Spitzbergen, by a merchant of the name of Jeremiah Oxladmkof, of Mesen, a town in the province of Jesovia, in the government of Archangel. She sailed in 1743 on her first voyage. We can conceive how lonely the home of Alexis must have been without him. We may be sure that his wife's last prayer at night was offered up for his safety. We constantly hear it said, in stormy weather: 'God help those who are at sea!' 'God help those who have friends at sea!' might be added to the petition; for there are hearts which quail at every gust of wind—there are thick-coming fancies, which can conjure up tempest-tossed vessels, sweeping gales, and raging billows; and yet the ship may at that very moment be in calm waters, or sailing with a prosperous breeze.

The time came that there might be some account of Himkof—then, that the vessel might be back; but no news or vessel came. Month after month passed on, and still it came not; and then years went by, and still there was no ship: whenever a sail was seen in the distance, the poor wife would hasten to the shore; but still the ship she looked for never came. With a sinking heart, she would retrace her steps homewards; but still she came again and again, so true it is that affection and hope are the last earthly companions that part company. The neighbours would look at her as she passed along, and shake their heads in pity.

The vessel, which had fourteen hands on board, had sailed on with a fair wind for eight days. On the ninth it veered, and instead of reaching the west of Spitzbergen, the place of rendezvous for the vessels employed annually in the whale-fishery, it was driven eastward of those islands. A few days brought her near one of them, known as East Spitzbergen. When within about two English miles, she was hemmed in by ice, and in extreme danger. In this dreadful emergency, the crew consulted on what was best to be done. Himkof mentioned that he had been told, some time before, that some men from Mesen, having decided on wintering on the island, had provided themselves with timber for building a hut, which they accordingly erected at some distance from the shore. Being quite aware, that if they remained in their present situation, they must inevitably perish, they determined to search for the hut, and to winter there, if so fortunate as to find it. Himkof, with three others, were selected to make the search. They were provided with a musket, twelve charges of powder, a dozen balls, an axe, a small kettle, a tinder-box and tinder, a wooden pipe for each, some tobacco, and a bag with twenty pounds of flour. This was as much as they could carry with safety, as they had to make their way for two miles over loose ridges of ice, which would be still more difficult and dangerous if they were overloaded, and it required the utmost caution to avoid falling between these ridges, which had been raised by the waves and driven together by the winds. The footing once lost, inevitable destruction must follow. They had not proceeded above an English mile, when, to their great delight, they descried the hut, at a distance of about a mile and a half from the shore. Its length was thirty-six feet, and its breadth and height eighteen. It consisted of two rooms. The ante-chamber was about twelve feet broad, and had two doors—one to exclude the outer air, the other by which

it communicated with the inner room, in which there was an earthen stove, such as is commonly used in Russia. A very slight inspection sufficed to shew that the hut had sustained great injury from the weather; but to have found it in any condition was a subject of great joy, and they availed themselves of its shelter for the night.

Eager to communicate the good news to their companions, they set out early the next morning; and as they went on, they chatted cheerfully about the stores of ammunition and provisions, and various requisites which could be conveyed from the ship, to be stored in the hut for winter use. They pursued their way in the highest spirits, picturing to themselves the delight which they were about to give to their companions. When they arrived on the shore, not a vestige of the ship was to be seen; no track through the waters marked her path; all was still and silent, desolate and bleak: no familiar face was seen; not one of their comrades was left to tell the hapless tale! They stood aghast, looking in mute despair upon the sea. The ice by which the vessel had been hemmed in had totally disappeared. The violent storm of the night before, they concluded, might have been the cause of this fatal disaster; the ice might have been disturbed by the agitation of the waves, and beaten violently against the ship, till she was shattered to pieces; or she might, perhaps, have been carried on by the current into the ocean, and there lost. However it might have been, they were never to see her again. What a difference a few short moments had made in their feelings and in their fate! They thought to have re-entered the hut with glad companions; they returned to it the sole inhabitants of that desolate region, disconsolate, and utterly hopeless of ever leaving it. When they could collect their thoughts, they were anxiously turned to the preservation of their lives, for which it was necessary to provide some kind of sustenance. The island abounded with reindeer, and they brought down one with every charge of their powder. They set about devising means to repair the hut, which, from the cracks and crevices produced by the weather, let in the piercingly cold air in various directions. No wood, or even shrub, grew on that sterile ground. Nothing could be more dreary than the prospect—a bleak waste without vegetation; the high mountains with their rock and crags; the everlasting ice and the vast masses of snow. The very sublimity of the scene was awfully impressed with all the marks of stern desolation and solitude. As in that cold climate wood is not liable to decay, they joined the boards of which the hut was constructed, with the help of their axe, very tolerably, filling up the crevices with moss, which grows in abundance all over the island. The poor men, like all of their country, were expert carpenters, for it is customary with them to build their own houses. No want could have been more dreadful than that of wood, for without firing, they could never bear up against the intense cold.

As they strayed along the beach, they found, to their joy, a quantity of wood which had been carried in by the tide. What they first got in this way were parts of the wreck of vessels, and afterwards trees, which had been uprooted by the overflowing of rivers, and borne by the waves into the ocean; but what proved a treasure to the poor castaways, were some boards which they discovered on the beach, with a long iron hook, some nails of five or six inches long, and thick in proportion, and other pieces of iron fastened in them—the sad memorials of some shattered vessel. Kind Providence seemed to have directed their steps where help was to be found. Just at the time when their provisions had nearly failed, and when they were without the means of replenishing their store, they perceived, not far from the boards, the root of a fir-tree, which had almost taken the form of a bow. With the

help of their knife, they soon brought it into more regular shape, but they were unprovided with a string and with arrows. They determined, in the first instance, to make two lances, to guard themselves against the formidable attacks of the ferocious white bear; but without a hammer, it was impossible to form their heads, or those of the arrows. However, by heating the iron hook, and widening a hole which it happened to have in the centre, with the help of one of the large nails, they inserted the handle, and a round button at one end of the hook, made the face of the hammer. A large pebble served for an anvil, and a pair of reindeer's horns were the tongs. Such were the tools with which they fashioned the heads for two spears, which they polished and sharpened on stones, and then tied them fast with strips of reindeer-skin to thick sticks, with which they were supplied from the branches of trees which had been wafted on shore. Thus armed, they attacked a white bear, and after a desperate struggle, they succeeded in killing him. They made use of the flesh for food, which they described as being like beef; by separating the tendons, they were supplied with filaments as fine as they pleased, which enabled them to string their bow. Their next work was to form pieces of iron into heads for their arrows, like the spears which they had already manufactured. They polished and sharpened them in the same way, and made them fast to pieces of the fir with the sinews of the white bear; feathers of sea-fowl being tied with the filaments. They were now equipped with a complete bow and arrows, which proved a most serviceable acquisition, and furnished them from time to time with reindeer to the amount of 250, besides vast numbers of the blue and white foxes; providing them not only with food, but with clothing, as their skins were a great defence from the coldness of the climate.

They destroyed no more than ten white bears; these animals defended themselves with prodigious strength and fury. The first was attacked by the sailors; the other nine were the assailants. Some of them were so daring as to walk into the hut in search of their prey. Those among them who were the least voracious were easily driven away, but the more ravenous were not to be deterred; and it was not without encountering the most imminent danger that the men escaped in the dreadful conflicts. But they were in continual fear of being devoured, as these ferocious animals repeated their visits to the hut, and renewed their attacks continually. When they succeeded in slaying one, they made use of its flesh as food, which, with that of the reindeer and the blue and white foxes, were the only kind they could have in that bleak region.

The want of the necessary conveniences obliged them for some time to make use of their food without cooking. They had nothing in the way of bread or salt. The stove within was set up after the Russian fashion, and could boil nothing. The cold was so intense, that all the wood they had was reserved for the stove; they had none to spare for making a fire outside, from which they would have had but little heat, and where they would run the risk of being attacked by the white bear. Besides, the masses of snow which fell during the winter months, and the heavy rains, would have made it quite impossible, for great part of the year, to have kept a fire burning in the open air. They, however, thought of a plan by which they were enabled to prepare some of their food. In the summer months, they exposed part of their animal food in the sun, and then hung it in the upper part of the hut, where it became thoroughly dried by the smoke. This food they used as bread, with that which they were obliged to eat half raw. By this means they were able to keep up a constant supply of provisions. They had water in the summer from the rills which fell from the rocks, and in winter, they were supplied from the snows and thawed ice.

Their only utensil for holding water, and substitute for a drinking-cup, was their small kettle.

Half of the flour had been consumed by the men with their meat; the remaining portion was preserved for a different purpose. The dread of their fire going out, and of the difficulty which they should find in lighting another, without match or tinder, set their wits to work to find means to avert so great a misfortune. They obtained from the middle of the island a particular kind of slimy clay, which they had observed, and of which they modelled a sort of lamp, and filled it with the fat of the reindeer. They contrived a wick with a piece of twisted linen. When they flattered themselves that their object was accomplished, they met with a great disappointment, for the melting grease ran through the lamp. To make a new one, and to fill up the pores of the material of which it was made, was now their care. When formed, they dried it in the air, and then heated it red-hot, in which state they immersed it in their kettle, in a preparation of flour, which had been boiled down to the consistence of starch. They now tested it by filling it with melted fat, and to their infinite delight, they found that they had succeeded in fashioning one that did not leak. To make it still more secure, they covered the outside with linen dipped in the starch.

In managing to have light during the dreary months of darkness, they had attained a great object, which had been doubly desirable on account of him who was languishing in sickness. That they might not be wholly dependent on one lamp, of which some accident might deprive them, they made another. In collecting such wood as had been cast on shore for fuel, they had fortunately found some cordage and a little oakum (the sort of hemp used for calking ships), which they turned to great account as wicks for their lamps. When this store was consumed, they had recourse to their shirts and drawers—a part of dress worn by almost all Russian peasants—to supply the want. Like the sacred fire, these lamps were never suffered to go out. As they were formed soon after their arrival, they were kept burning without intermission for the years they passed in their comfortless abode.

The sacrifice made of their shirts and drawers exposed them more to the intense cold. Their shoes, boots, and other parts of their dress, were worn out. In this emergency, it was necessary to form some plan for defending themselves from the inclemency of the climate. The skins of the reindeer and foxes, which they had converted into bedding, now afforded the materials for clothing. They were submerged in fresh water for several days, till the hair was so loosened that it was easily removed; the leather was then rubbed with their hands till nearly dry, then melted reindeer fat was spread over it, and then it was again rubbed. It thus became soft, and fit for the use to which it was to be put. Some of the skins which they wished to reserve for furs did not undergo exactly the same process, but were merely left in water for one day, and were then prepared in the same manner, without removing the hair. Though now furnished with the materials for clothing, they were without the implements necessary for making them into articles of dress. They had neither awls for making shoes and boots, nor needles for sewing their clothes. Their ingenuity was, therefore, again put to the test, and was not slow in making up the deficiency. They contrived to make both very well, out of the bits of iron which they had collected from time to time. One of their most difficult tasks, was to make eyes to their needles; but this they accomplished with the help of their knife; for having ground it to a very sharp point, and heated a kind of wire, forged for the purpose, red-hot, they pierced a hole through one end, and by whetting and smoothing it on stones, brought the other to a point. These needles were astonishingly well formed,

nothing being amiss with them but the roughness of the eye, by which the thread was sometimes cut. It was indeed surprising that they were so well made, considering the rude instruments with which they were fashioned. Having no scissors, they were obliged to cut out their clothes with the knife; and though this was their first attempt at the trade of shoemaker or tailor, yet they contrived to cut out the articles which they required with as much precision as if they had served a regular apprenticeship to the business. The sinews of the reindeer and bears answered for thread. They set earnestly to their work. For summer wear, they made a sort of jacket and trousers of the prepared skins; for winter, long fur-gowns, with hoods, made after the fashion of those worn by the Laplanders.

The constant employment which their necessities required, and the various difficulties which they had to overcome by ingenious contrivance, so far from having been a misfortune, may be considered as having been the means of preserving these poor men from sinking under their unhappy circumstances. But accordingly as their ingenuity had supplied their wants, and their minds became more disengaged from expedients, their melancholy increased, and they looked round despondingly on the sterile and desolate region where, they felt, they were to spend the rest of their days, far away from the hearths of home, and from early friends and companions. Even the probability of that little circle being lessened, and, it might be, reduced to one solitary being, was a dreadful thought: each felt that this might be his own fate. Then the fear of all means of sustenance failing, and the assaults of wild beasts, were dangers too glaring to be forgotten. Alexis Himkof, who had left a wife and three children, suffered perhaps the most from heart-yearnings after home.

They had already lost one of their companions from the effects of scurvy; and now, when six dreary years had nearly passed, another was taken from among them. It chanced on the 15th of August 1749, while they were lamenting their poor companion, that they desecrated a vessel. Who can describe the tumults of their feelings, the fluttering of their hearts? Their fate hung upon a chance. Oh, if she would come to relieve them! oh, if they could pass once more those rude barriers of ice, and cut through those interminable waves again! But she might pass on, and leave them to a fate rendered still more miserable by the fallacious gleam of hope. With trembling haste they ran hither and thither, and almost flew to light the signal-fires of distress along the hills, and now to the beach, to wave the rude flag, formed of a reindeer's skin fastened to a pole. What agitating hopes and fears were crowded into that space of time, as the vessel made her way through the waters! The signals of distress were seen—were heeded! She comes! she comes! and now she anchors near the shore. What a day of joy and thankfulness! But the delight of the poor mariners may be more easily conceived than described. Their bargain with the master of the ship—a Russian vessel—was soon made: they were to work for him on the voyage, and they agreed to pay eighty rubles on landing. He took them on board with all their possessions, consisting of two thousand pounds of the lard of the reindeer in the hides of those animals, and of the white and blue foxes, and the skins of the ten white bears that they had destroyed. They also took with them their bow and arrows, and all the implements which they had manufactured. These were deposited in a bone box, made with great ingenuity, with no tool but their knife. We have in these men a very remarkable example of the energy which can sustain in the most trying circumstances, and the ingenious skill which can furnish expedients, even in a region so destitute of resources. It may well teach us to trust in that good Providence which is indeed a present help in trouble.

They reached Archangel on the 28th of September

1749. What happy meetings may have been anticipated!—what calamities may have been dreaded during that voyage!—How may it have fared with those who were left? Will they all be there, to greet with a joyful welcome? What if Alexis's wife, worn out by suspense and anxiety, should have sunk into an early grave?—or if one among their children should have died?—or if the three should all have been swept away? The approaching sail had been seen; and the one who for years had clung to a forlorn-hope, was again at the water's edge. Alexis stood on the deck. Affection is quick-sighted; he was instantly seen and known by his wife! All was forgotten—all but that he was there. The distance between them, the waves that separated them, were unheeded! Uttering a wild cry of joy, she rushed forward to clasp him in her arms. She sprang into the water—a little time, and she was extricated. She was insensible when taken up. When she came to herself, she was in her husband's arms!—their children were about them! What tears of joy were shed!—what prayers of thankfulness were offered up!

The foregoing narrative, true in every respect, is drawn up by us from documents issued under the authority of the Russian government. It shews, in a convincing manner, that subsistence is by no means impossible for sailors wrecked and icebound within the polar regions.

WILD ANIMALS IN CONFINEMENT.

Were it not that custom reconciles us to everything, a Christian community would surely be shocked by the report, and still more by the sight, of the sacrifice of innocent and helpless creatures—pigeons and rabbits, for instance—to the horrible instincts of snakes, who will not eat anything but what is alive. An account was recently given of a night-visit to the place of confinement of these disgusting reptiles, in which the evident horror of their intended victims, confined in the same cages, was distinctly mentioned. The gratification of mere curiosity does not justify the infliction of such torture on the lower animals. Surely the sight of a stuffed boa-constrictor ought to content a reasonable curiosity. Imagine what would be felt if a child were subjected to such a fate, or what could be answered if the present victims could tell their agonies as well as feel them! Byron speaks of the barbarians who, in the wantonness of power, were 'butchered to make a Roman holiday;' and verily the horrors exhibited in our public gardens and menageries are something akin to the fights of gladiators: it is the infliction of misery for mere sport. With reference also to lions, tigers, and other ferocious animals kept in cages—if retained at all, the space allotted them ought to be much larger than it is, so as to allow them full room for healthful exercise. At present, they must be wretched; and considering also the quantity of food they consume, which might be converted to useful purposes—though this is taking a lower view of the matter—it is at least desirable that the number should be much smaller, and a much greater space allowed them to exhibit their natural vivacity. These remarks do not, of course, apply to fowls and other animals who are allowed a sufficient share of liberty to exist in comfort, and to whom it is not necessary to sacrifice the existence of other creatures.—*Ogden's Friendly Observer.*

[We entirely agree in reprobating the practice of placing live rabbits and other creatures within the cages of boa-constrictors. A recollection of a poor little rabbit cowering in the corner of one of these cages, as if aware of its approaching fate, has haunted us for years. No purpose of science can be answered by this constantly recurring barbarity. Zoological Societies should be careful not to run any risk of countenancing by such spectacles the elevated feelings they are so well calculated to foster.—*Ed. C. E. J.*]

PUFF AND PUSH.

It is said that everything is to be had in London. There is truth enough in the observation; indeed, rather too much. The conviction that everything is to be had, whether you are in want of it or not, is forced upon you with a persistence that becomes oppressive; and you find that, owing to everything being so abundantly plentiful, there is one thing which is *not* to be had, do what you will, though you would like it, have it if you could—and that one thing is just one day's exemption from the persecutions of Puff in its myriad shapes and disguises. But it is not to be allowed; all the agencies that will work at all are pressed into the service of pushing and puffing traffic; and we are fast becoming, from a nation of shopkeepers, a nation in a shop. If you walk abroad, it is between walls swathed in puffs; if you are lucky enough to drive your gig, you have to 'cut in and out' between square vans of crawling puffs; if, alighting, you cast your eyes upon the ground, the pavement is stencilled with puffs; if in an evening stroll you turn your eye towards the sky, from a paper balloon the clouds drop puffs. You get into an omnibus, out of the shower, and find yourself among half a score of others, buried alive in puffs; you give the conductor sixpence, and he gives you three pennies in change, and you are forced to pocket a puff, or perhaps two, stamped indelibly on the copper coin of the realm. You wander out into the country, but the puffs have gone thither before you, turn in what direction you may; and the green covert, the shady lane, the barks of columned beeches and speckled birches, of gnarled oaks and rugged elms—no longer the mysterious haunts of nymphs and dryads, who have been driven far away by the omnivorous demon of the shop—are all invaded by Puff, and subdued to the office of his ministering spirits. Puff, in short, is the monster megatherium of modern society, who runs rampaging about the world, his broad back in the air, and his nose on the ground, playing all sorts of ludicrous antics, doing very little good, beyond filling his own insatiable maw, and nobody knows how much mischief in accomplishing that.

Push is an animal of a different breed, naturally a thorough-going, steady, and fast-trotting hack, who mostly keeps in the Queen's highway, and knows where he is going. Unfortunately, he is given to break into a gallop now and then; and whenever in this vicious mood, is pretty sure to take up with Puff, and the two are apt to make wild work of it when they scamper about together. The worst of it is, that nobody knows which is which of these two termagant trampers: both are thoroughly protean creatures, changing shapes and

characters, and assuming a thousand different forms every day; so that it is a task all but impossible to distinguish one from the other. Hence a man may get upon the back of either without well knowing whither he will be carried, or what will be the upshot of his journey.

Dropping our parable, and leaving the supposed animals to run their indefinite career, let us take a brief glance at some of the curiosities of the science of Puffing and Pushing—for both are so blended, that it is impossible to disentangle one from the other—as it is carried on at the present hour in the metropolis.

The business of the shopkeeper, as well as of all others who have goods to sell, is of course to dispose of his wares as rapidly as possible, and in the dearest market. This market he has to create, and he must do it in one of two ways: either he must succeed in persuading the public, by some means or other, that it is to their advantage to deal with him, or he must wait patiently and perseveringly until they have found that out, which they will inevitably do if it is a fact. No shop ever pays its expenses, as a general rule, for the first ten or twenty months, unless it be literally crammed down the public throat by the instrumentality of the press and the boarding; and it is therefore a question, whether it is cheaper to wait for a business to grow up, like a young plant, or to force it into sudden expansion by artificial means. When a business is manageable by one or two hands, the former expedient is the better one, and as such is generally followed, after a little preliminary advertising, to apprise the neighbourhood of its whereabouts. But when the proprietor has an army of assistants to maintain and to salarise, the case is altogether different: the expense of waiting, perhaps for a couple of years, would swallow up a large capital. On this account, he finds it more politic to arrest the general attention by a grand stir in all quarters, and some obtrusive demonstration palpable to all eyes, which shall blazon his name and pretensions through every street and lane of mighty London. Sometimes it is a regiment of foot, with placarded banners; sometimes one of cavalry, with bill-plastered vehicles and bands of music; sometimes it is a phalanx of bottled humanity, crawling about in labelled triangular phials of wood, corked with woful faces; and sometimes it is all these together, and a great deal more besides. By this means, he conquers reputation, as a despot sometimes carries a throne, by a *coup d'état*, and becomes a celebrity at once to the million, among whom his name is infinitely better known than those of the greatest benefactors of mankind. All this might be tolerable enough if it ended here; but, unhappily, it does not. Experiment has shewn that, just as gudgeons will bite at

anything when the mud is stirred up at the bottom of their holes, so the ingenious public will lay out their money with anybody who makes a prodigious noise and clatter about the bargains he has to give. The result of this discovery is, the wholesale daily publication of lies of most enormous calibre, and their circulation, by means which we shall briefly notice, in localities where they are likely to prove most productive.

The advertisement in the daily or weekly papers, the placard on the walls or boardings, the perambulating vans and banner-men, and the doomed hosts of bottle-impis and extinguishers, however successful each may be in attracting the gaze and securing the patronage of the multitude, fail, for the most part, of enlisting the confidence of a certain order of customers, who, having plenty of money to spend, and a considerable share of vanity to work upon, are among the most hopeful fish that fall into the shopkeeper's net. These are the female members of a certain order of families—the amiable and genteel wives and daughters of the commercial aristocracy, and their agents, of this great city. They reside throughout the year in the suburbs: they rarely read the newspapers; it would not be genteel to stand in the streets spelling over the bills on the walls; and the walking and riding equipages of puffing are things decidedly low in their estimation. They must, therefore, be reached by some other means; and these other means are before us as we write, in the shape of a pile of circular-letters in envelopes of all sorts—plain, hot-pressed, and embossed; with addresses—some in manuscript, and others in print—some in a gracefully genteel running-hand, and others decidedly and rather obtrusively official in character, as though emanating from government authorities—each and all, however, containing the bait which the lady-gudgeon is expected to swallow. Before proceeding to open a few of them for the benefit of the reader, we must apprise him of a curious peculiarity which marks their delivery. Whether they come by post, as the major part of them do, not a few of them requiring a double stamp, or whether they are delivered by hand, one thing is remarkable—they *always come in the middle of the day*, between the hours of eleven in the forenoon and five in the afternoon, when, as a matter of course, the master of the house is not in the way. Never, by any accident, does the morning-post, delivered in the suburbs between nine and ten, produce an epistle of this kind. Let us now open a few of them, and learn from their contents what is the shopkeeper's estimate of the gullibility of the merchant's wife, or his daughter, or of the wife or daughter of his managing clerk.

The first that comes to hand is addressed thus: 'No. 2795.—DECLARATIVE NOTICE.—From the Times, August 15, 1851.' The contents are a circular, handsomely printed on three crowded sides of royal quarto glazed post, and containing a list of articles for peremptory disposal, under unheard-of advantages, on the premises of Mr Gobblemadam, at No. 541 New Ruin Street. Without disguising anything more than the addresses of these puffing worthies, we shall quote *verbatim* a few paragraphs from their productions. The catalogue of bargains in the one before us comprises almost every species of textile manufacture, as well native as foreign—among which silks, shawls, dresses, furs, and mantles are the most prominent; and amazing bargains they are—witness the following extracts:

'A marvellous variety of fancy silks, cost from 4 to 5 guineas each, will be sold for L.1, 19s. 6d. each.
Robes of damas and broche (foreign), cost 6 guineas, to be sold for 2½ guineas.
Embroidered muslin robes, newest fashion, cost 18s. 9d., to be sold for 9s. 6d.
Worked lace dresses, cost 35s., to be sold at 14s. 9d.
Do. do. cost 28s. 6d., to be sold at 7s. 6d.
Newest dresses, of fashionable materials, worth 35s., to be sold for 9s. 9d.

Splendid Paisley shawls, worth 2½ guineas, for 16s.
Cashmere shawls (perfect gems), cost 4 guineas, to be sold for 35s.

A long list of similar bargains closes with a declaration that, although these prices are mentioned, a clearance of the premises, rather than a compensation for the value of the goods, is the great object in view; that the articles will be got rid of regardless of price; and that 'the disposal will assume the character of a gratuitous distribution, rather than of an actual sale.' This is pretty well for the first hap-hazard plunge into the half-bushel piled upon our table. Mr Gobblemadam may go down. Let us see what the next will produce.

The second is addressed thus: 'To be opened within two hours after delivery.—SPECIAL COMMISSION.—Final Audit, 30th October 1851.' The contents are a closely-printed extra-royal folio broadside, issued by the firm of Messrs Shavelass and Swallowher, of Tottering Terrace West. It contains a voluminous list of useful domestic goods, presenting the most enormous bargains, in the way of sheetings, shirtings, flannels, diapers, damasks, dimities, table-cloths, &c. &c. The economical housewife is cautioned by this generous firm, that to disregard the present opportunity would be the utmost excess of folly, as the whole stock is to be peremptorily sold considerably under half the cost price. The following are a few of the items:

'Irish lines, warranted genuine, 9½d. per yard.
Fine cambric handkerchiefs, 2s. 6d. per dozen.
Curtain damask, in all colours, 6½d. per yard.
Swiss curtains, elegantly embroidered, four yards long, for 6s. 9d. a pair—cost 17s. 6d.
Drawing-room curtains, elaborately wrought, at 8s. 6d. a pair—cost 21s.'

The bargains, in short, as Messrs Shavelass and Swallowher observe, are of such an astounding description, as 'to strike all who witness them with wonder, amazement, and surprise;' and 'demand inspection from every lady who desires to unite superiority of taste with genuine quality and economy.'

The next is a remarkably neat envelope, with a handsomely embossed border, bearing the words, 'OX ESPECIAL SERVICE' under the address, and winged with a two-penny stamp. The enclosure is a specimen of fine printing on smooth, thin vellum, in the form of a quarto catalogue, with a deep, black-bordered title-page, emanating from the dreary establishment of Messrs Moan and Groan, of Cypress Row. Here commerce condescends to sympathy, and measures forth to bereaved and afflicted humanity the outward and visible symbols of their hidden griefs. Here, when you enter his gloomy penetralia, and invoke his services, the sable-clad and cadaverous-featured shopman asks you, in a sepulchral voice—we are not writing romance, but simple fact—whether you are not suited for inextinguishable sorrow, or for mere passing grief; and if you are at all in doubt upon the subject, he can solve the problem for you, if you lend him your confidence for the occasion. He knows from long and melancholy experience the agonising intensity of wo expressed by bombazine, crape, and Paramatta; can tell to a sigh the precise amount of regret that resides in a black bonnet; and can match any degree of internal anguish with its corresponding shade of colour, from the utter desolation and inconsolable wretchedness of dead and dismal black, to the transient sentiment of sorrowful remembrance so appropriately symbolised by the faintest shade of lavender or French gray. Messrs Moan and Groan know well enough, that when the heart is burdened with sorrow, considerations of economy are likely to be banished from the mind as out of place, and disrespectful to the memory of the departed; and, therefore, they do not affront their sorrowing patrons with the sublimary details of pounds, shillings, and pence. They speed

on the wings of the post to the house of mourning, with the benevolent purpose of comforting the afflicted household. They are the first, after the stroke of calamity has fallen, to mingle the business of life with its regrets; and to cover the woes of the past with the allowable vanities of the present. Step by step, they lead their melancholy patrons along the meandering margin of their flowing pages—from the very borders of the tomb, through all the intermediate changes by which sorrow publishes to the world its gradual subsidence, and land them at last in the sixteenth page, restored to themselves and to society, in the frontbox of the Opera, glittering in 'splendid head-dresses in pearl,' in 'fashionably elegant turbans,' and in 'dress-caps trimmed with blonde and Brussels lace.' For such benefactors to womankind—the dears—of course no reward can be too great; and, therefore, Messrs Moan and Groan, strong in their modest sense of merit, make no parade of prices. They offer you all that in circumstances of mourning you can possibly want; they scorn to do you the disgrace of imagining that you would drive a bargain on the very brink of the grave; and you are of course obliged to them for the delicacy of their reserve on so commonplace a subject, and you pay their bill in decorous disregard of the amount. It is true, that certain envious rivals have compared them to birds of prey, scenting mortality from afar, and hovering like vultures on the trail of death, in order to profit by his dart; but such 'caparisons,' as Mrs Malaprop says, 'are odorous,' and we will have nothing to do with them.

The next, and the last we shall examine ere Betty claims the whole mass to kindle her fires, is a somewhat bulky envelope, addressed in a neat hand: *To the Lady of the House*. It contains a couple of very voluminous papers, almost as large as the broad page of *The Times*, one of which advertises mysteriously to some appalling calamity, which has resulted in a 'most DISASTROUS FAILURE, productive of the most intense excitement in the commercial world.' We learn further on, that from various conflicting circumstances, which the writer does not condescend to explain, above L.150,000 worth of property has come into the hands of Messrs Grabble and Grab, of Smash Place, 'which they are resolute in summarily disposing of on principles commensurate with the honourable position they hold in the metropolis.' Then follows a list of tempting bargains, completely filling both the broad sheets. Here are a few samples:

'Costly magnificent long shawls, manufactured at L.6, to be sold for 18s. 6d.

Fur victorines, usually charged 18s. 6d., to sell at 1s. 3d.

2500 shawls (Barège), worth 21s. each, to sell at 5s.

Embroidered satin shawls (magnificent), value 20 guineas each, to be sold for 3 guineas.'

The reader is probably satisfied by this time of the extraordinary cheapness of these inexhaustible wares, which thus go begging for purchasers in the bosoms of families. It is hardly necessary to inform him, that all these enormous pretensions are so many lying delusions, intended only to bring people in crowds to the shop, where they are effectually fleeced by the jackals in attendance. If the lady reader doubt the truth of our assertion, let her go for once to the establishment of Messrs Grabble and Grab last named. An omnibus from any part of the city or suburbs will, as the circular informs you, set you down at the door. Upon entering the shop, you are received by a polite inquiry from the 'walker' as to the purpose of your visit. You must say something in answer to his torrent of civility, and you probably name the thing you want, or at least which you are willing to have at the price named in the sheet transmitted to you through the post. Suppose you utter the word 'shawl.' 'This way, madam,' says he; and forthwith leads you a long dance to the end of the counter, where he consigns you

over to the management of a plausible genius invested with the control of the shawl department. You have perhaps the list of prices in your hand, and you point out the article you wish to see. The fellow shews you fifty things for which you have no occasion, in spite of your reiterated request for the article in the list. He states his conviction, in a flattering tone, that *that* article would not become you, and recommends those he offers as incomparably superior. If you insist, which you rarely can, he is at length sorry to inform you that the article is unfortunately just now out of stock, depreciating it at the same time as altogether beneath *your* notice; and in the end succeeds in cramming you with something which you don't want, and for which you pay from 15 to 20 per cent. more than your own draper would have charged you for it.

The above extracts are given in illustration of the last new discovery in the science of puffing—a discovery by which, through the agency of the press, the penny-post, and the last new London Directory, the greatest rogues are enabled to practise upon the simplicity of our better-halves, while we think them secure in the guardianship of home. We imagine that, practically, this science must be now pretty near completion. Earth, air, fire, and water, are all pressed into the service. It has its painters, and poets, and literary staff, from the bard who tunes his harp to the praise of the pantaloons of the great public benefactor Noses, to the immortal professoress of crochet and cross-stitch, who contracts for L.120 a year to puff in 'The Family Fudge' the superexcellent knitting and boar's-head cotton of Messrs Steel and Goldseye. It may be that something more is yet within the reach of human ingenuity. It remains to be seen whether we shall at some future time find puffs in the hearts of lettuces and summer-cabbages, or shell them from our green-peas and Windsor beans. It might be brought about, perhaps, were the market-gardeners enlisted in the cause; the only question is, whether it could be made to pay.

RECOLLECTIONS OF A POLICE-OFFICER.

THE MONOMANIAC.

THE following narrative relates more to medical than to criminal history; but as the affair came in some degree under my notice as a public officer, I have thought it might not be altogether out of place in these slight outlines of police experience. Strange and unaccountable as it may at first appear, its general truth will hardly be questioned by those who have had opportunities of observing the fantastic delusions which haunt and dominate the human brain in certain phases of mental aberration.

On arriving in London, in 1831, I took lodgings at a Mr Renshaw's, in Mile-End Road, not far from the turnpike-gate. My inducement to do so, was partly the cheapness and neatness of the accommodation, partly that the landlord's maternal uncle, a Mr Oxley, was slightly known to me. Henry Renshaw I knew by reputation only, he having left Yorkshire ten or eleven years before, and even that knowledge was slight and vague. I had heard that a tragical event had cast a deep shadow over his after-life; that he had been for some months the inmate of a private lunatic asylum; and that some persons believed his brain had never thoroughly recovered its originally healthy action. In this opinion, both my wife and myself very soon concurred; and yet I am not sure that we could have given a satisfactory reason for such belief. He was, it is true, usually kind and gentle, even to the verge of simplicity, but his general mode of expressing himself and

conducting business was quite coherent and sensible; although, in spite of his resigned cheerfulness of tone and manner, it was at times quite evident, that whatever the mental hurt he had received, it had left a rankling, perhaps remorseful, sting behind. A small, well-executed portrait in his sitting-room suggested a conjecture of the nature of the calamity which had befallen him. It was that of a fair, mild-eyed, very young woman, but of a pensive, almost mournful, cast of features, as if the coming event, briefly recorded in the lower right-hand corner of the painting, had already, during life and health, cast its projecting shadow over her. That brief record was this:—'Laura Hargreaves, born 1804; drowned 1821.' No direct allusion to the picture ever passed his lips, in my hearing, although, from being able to chat together of Yorkshire scenes and times, we speedily became excellent friends. Still, there were not wanting, from time to time, significant indications, though difficult to place in evidence, that the fire of insanity had not been wholly quenched, but still smouldered and glowed beneath the habit-hardened crust which concealed it from the careless or casual observer. Exciting circumstances, not very long after my arrival in the metropolis, unfortunately kindled those brief wild sparkles into a furious and consuming flame.

Mr Renshawe was in fair circumstances—that is, his income, derived from funded property alone, was nearly £300 a year; but his habits were close, thrifty, almost miserly. His personal appearance was neat and gentlemanly, but he kept no servant. A charwoman came once a day to arrange his chamber, and perform other household work, and he usually dined, very simply, at a coffee-house or tavern. His house, with the exception of a sitting and bed room, was occupied by lodgers; amongst these, was a pale, weakly-looking young man, of the name of Irwin. He was suffering from pulmonary consumption—a disease induced, I was informed, by his careless folly in remaining in his wet clothes after having assisted, during the greater part of the night, at a large fire at a coach-factory. His trade was in gold and silver lace-work—bullion for epaulettes, and so on; and as he had a good connection with several West-end establishments, his business appeared to be a thriving one; so much so, that he usually employed several assistants of both sexes. He occupied the first floor, and a workshop at the end of the garden. His wife, a pretty-featured, well-formed, graceful young woman, of not more than two or three-and-twenty, was, they told me, the daughter of a schoolmaster, and certainly had been gently and carefully nurtured. They had one child, a sprightly, curly-haired, bright-eyed boy, nearly four years old. The wife, Ellen Irwin, was reputed to be a first-rate hand at some of the lighter parts of her husband's business; and her efforts to lighten his toil, and compensate by increased exertion for his daily diminishing capacity for labour, were unwearied and incessant. Never have I seen a more gentle, thoughtful tenderness, than was displayed by that young wife towards her suffering, and sometimes not quite evenly-tempered partner, who, however, let me add, appeared to reciprocate truthfully her affection; all the more so, perhaps, that he knew their time together upon earth was already shrunk to a brief span. In my opinion, Ellen Irwin was a handsome, even an elegant young person: this, however, is in some degree a matter of taste. But no one could deny that the gentle kindness, the beaming compassion, that irradiated her features as she tended the fast-sinking

invalid, rendered her at such times absolutely beautiful—angelised her, to use an expression of my wife's, with whom she was a prime favourite. I was self-debating for about the twentieth time one evening, where it was I had formerly seen her, with that sad, mournful look of hers; for seen her I was sure I had, and not long since either. It was late; I had just returned home; my wife was in the sick-room, and I had entered it with two or three oranges:—'Oh, now I remember,' I suddenly exclaimed, just above my breath; 'the picture in Mr Renshawe's room! What a remarkable coincidence!'

A low, chuckling laugh, close at my elbow, caused me to turn quickly towards the door. Just within the threshold stood Mr Renshawe, looking like a white stone-image rather than a living man, but for the fierce sparkling of his strangely gleaming eyes, and the mocking, triumphant curl of his lips. 'You, too, have at last observed it, then?' he muttered, faintly echoing the under-tone in which I spoke: 'I have known the truth for many weeks.' The manner, the expression, not the words, quite startled me. At the same moment, a cry of women rang through the room, and I immediately seized Mr Renshawe by the arm, and drew him forcibly away, for there was that in his countenance which should not meet the eyes of a dying man.

'What were you saying? What truth have you known for weeks?' I asked, as soon as we had reached his sitting-room.

Before he could answer, another wailing sound ascended from the sick-room. Lightning leaped from Renshawe's lustrous, dilated eyes, and the exulting laugh again, but louder, burst from his lips: 'Ha! ha!' he fiercely exclaimed. 'I know that cry! It is Death's!—Death's! Thrice-blessed Death, whom I have so often ignorantly cursed! But that,' he added quickly, and peering sharply in my face, 'was when, as you know, people said'—and he ground his teeth with rage—'people said I was crazed—mad!'

'What can you mean by this wild talk, my friend?' I replied in as unconcerned and quieting a tone as I could immediately assume. 'Come, sit down: I was asking the meaning of your strange words below, just now.'

'The meaning of my words? You know as well as I do. Look there!'

'At the painting? Well?'

'You have seen the original,' he went on with the same excited tone and gestures. 'It crossed me like a flash of lightning. Still, it is strange she does not know me. It is sure she does not! But I am changed, no doubt—sadly changed!' he added, dejectedly, as he looked in a mirror.

'Can you mean that I have seen Laura Hargreaves here?' I stammered, thoroughly bewildered. 'She who was drowned ten or eleven years ago?'

'To be sure—to be sure! It was so believed, I admit, by everybody—by myself, and the belief drove me mad! And yet, I now remember, when at times I was calm—when the pale face, blind staring eyes, and dripping hair, ceased for awhile to pursue and haunt me, the low, sweet voice and gentle face came back, and I knew she lived, though all denied it. But look, it is her very image!' he added fiercely, his glaring eyes flashing from the portrait to my face alternately.

'Whose image?'

'Whose image!—Why, Mrs Irwin's, to be sure. You yourself admitted it just now.' I was so confounded, that for several minutes I remained stupidly and silently staring at the man. At length I said: 'Well, there is a likeness, though not so great as I imagined'—

'It is false!' he broke in furiously. 'It is her very self.'

'We'll talk of that to-morrow. You are ill, over-

excited, and must go to bed. I hear Dr Garland's voice below: he shall come to you.'

'No—no—no!' he almost screamed. 'Send me no doctors; I hate doctors! But I'll go to bed—since—since you wish it; but no doctors! Not for the world!' As he spoke, he shrank cowering backwards, out of the room; his wavering, unquiet eyes fixed upon mine as long as we remained within view of each other: a moment afterwards, I heard him dart into his chamber, and bolt and double-lock the door.

It was plain that lunacy, but partially subdued, had resumed its former mastery over the unfortunate gentleman. But what an extraordinary delusion! I took a candle, and examined the picture with renewed curiosity. It certainly bore a strong resemblance to Mrs Irwin: the brown, curling hair, the pensive eyes, the pale fairness of complexion, were the same; but it was scarcely more girlish, more youthful, than the young matron was now, and the original, had she lived, would have been by this time approaching to thirty years of age! I went softly down stairs and found, as I feared, that George Irwin was gone. My wife came weeping out of the death-chamber, accompanied by Dr Garland, to whom I forthwith related what had just taken place. He listened with attention and interest; and after some sage observations upon the strange fancies which now and then take possession of the minds of monomaniacs, agreed to see Mr Renshawe at ten the next morning. I was not required upon duty till eleven; and if it were in the physician's opinion desirable, I was to write at once to the patient's uncle, Mr Oxley.

Mr Renshawe was, I heard, stirring before seven o'clock, and the charwoman informed me, that he had taken his breakfast as usual, and appeared to be in cheerful, almost high spirits. The physician was punctual: I tapped at the sitting-room door, and was desired to come in. Mr Renshawe was seated at a table with some papers before him, evidently determined to appear cool and indifferent. He could not, however, repress a start of surprise, almost of terror, at the sight of the physician, and a paleness, followed by a hectic flush, passed quickly over his countenance. I observed, too, that the portrait was turned with its face towards the wall.

By a strong effort, Mr Renshawe regained his simulated composure, and in reply to Dr Garland's professional inquiry, as to the state of his health, said with a forced laugh: 'My friend, Waters, has, I suppose, been amusing you with the absurd story that made him stare so last night. It is exceedingly droll, I must say, although many persons, otherwise acute enough, cannot, except upon reflection, comprehend a jest. There was John Kemble, the tragedian, for instance, who'—

'Never mind John Kemble, my dear sir,' interrupted Dr Garland. 'Do, pray, tell us the story over again. I love an amusing jest.'

Mr Renshawe hesitated for an instant, and then said with reserve, almost dignity of manner: 'I do not know, sir'—his face, by the way, was determinedly averted from the cool, searching gaze of the physician—'I do not know, sir, that I am obliged to find you in amusement; and as your presence here was not invited, I shall be obliged by your leaving the room as quickly as maybe.'

'Certainly—certainly, sir. I am exceedingly sorry to have intruded, but I am sure you will permit me to have a peep at this wonderful portrait.'

Renshawe sprang impulsively forward to prevent the doctor reaching it. He was too late; and Dr Garland, turning sharply round with the painting in his hand, literally transfixed him in an attitude of surprise and consternation. Like the Ancient Mariner, he held him by his glittering eye, but the spell was not an enduring one. 'Truly,' remarked Dr Garland, as he found the kind of mesmeric influence he had exerted beginning

to fail, 'not so very bad a chance resemblance; especially about the eyes and mouth!'

'This is very extraordinary conduct,' broke in Mr Renshawe; 'and I must again request that you will both leave the room.'

It was useless to persist, and we almost immediately went away. 'Your impression, Mr Waters,' said the physician as he was leaving the house, 'is, I daresay, the true one; but he is on his guard now, and it will be prudent to wait for a fresh outbreak before acting decisively; more especially as the hallucination appears to be quite a harmless one.'

This was not, I thought, quite so sure, but of course I acquiesced, as in duty bound; and matters went on pretty much as usual for seven or eight weeks, except that Mr Renshawe manifested much aversion towards myself personally, and at last served me with a written notice to quit at the end of the term previously stipulated for. There was still some time to that; and in the meanwhile, I caused a strict watch to be set, as far as was practicable, without exciting observation, upon our landlord's words and acts.

Ellen Irwin's first tumult of grief subsided, the next and pressing question related to her own and infant son's subsistence. An elderly man of the name of Tomlins was engaged as foreman; and it was hoped the business might still be carried on with sufficient profit. Mr Renshawe's manner, though at times indicative of considerable nervous irritability, was kind and respectful to the young widow; and I began to hope that the delusion he had for awhile laboured under had finally passed away.

The hope was a fallacious one. We were sitting at tea on a Sunday evening, when Mrs Irwin, pale and trembling with fright and nervous agitation, came hastily in with her little boy in her hand. I correctly divined what had occurred. In reply to my hurried questioning, the astounded young matron told me in substance, that within the last two or three days Mr Renshawe's strange behaviour and disjointed talk had both bewildered and alarmed her. He vaguely intimated that she, Ellen Irwin, was really Laura somebody else—that she had kept company with him, Mr Renshawe, in Yorkshire, before she knew poor George—with many other strange things he muttered rather than spoke out; and especially that it was owing to her son reminding her continually of his father, that she pretended not to have known Mr Renshawe twelve or thirteen years ago. 'In short,' added the young woman with tears and blushes, 'he is utterly crazed; for he asked me just now to marry him—which I would not do for the Indies—and is gone away in a passion to find a paper that will prove, he says, I am that other Laura something.'

There was something so ludicrous in all this, however vexatious and insulting under the circumstances—the recent death of the husband, and the young widow's unprotected state—that neither of us could forbear laughing at the conclusion of Mrs Irwin's story. It struck me, too, that Renshawe had conceived a real and ardent passion for the very comely and interesting person before us—first prompted, no doubt, by her accidental likeness to the portrait; and that some mental flaw or other caused him to confound her with the Laura who had in early life excited the same emotion in his mind.

Laughable as the matter was in one sense, there was—and the fair widow had noticed as well as myself—a serious, menacing expression in the man's eye not to be trifled with; and at her earnest request, we accompanied her to her own apartment, to which Renshawe had threatened soon to return. We had not been a minute in the room, when his hurried step was heard approaching, and Mrs Waters and I stepped hastily into an adjoining closet, where we could hear and partly see all that passed. Renshawe's speech

trembled with fervency and anger as he broke at once into the subject with which his disordered brain was reeling.

'You will not dare to say, will you, that you do not remember this song—that these pencil-marks in the margin were not made by you thirteen years ago?' he menacingly ejaculated.

'I know nothing about the song, Mr Renshawe,' rejoined the young woman with more spirit than she might have exhibited but for my near presence. 'It is really such nonsense. Thirteen years ago, I was only about nine years of age.'

'You persist, then, unfeeling woman, in this cruel deception! After all, too, that I have suffered: the days of gloom, the nights of horror, since that fearful moment when I beheld you dragged, a lifeless corpse, from the water, and they told me you were dead!'

'Dead! Gracious goodness, Mr Renshawe, don't go on in this shocking way! I was never dragged out of a pond, nor supposed to be dead—never! You quite frighten one.'

'Then you and I, your sister, and that thrice-cursed Bedford, did not, on the 7th of August 1821, go for a sail on the piece of water at Lowfield, and the skiff was not, in the deadly, sudden, jealous strife between him and me, accidentally upset? But I know how it is: it is this brat, and the memories he recalls, that'—

Mrs Irwin screamed, and I stepped sharply into the room. The grasp of the lunatic was on the child's throat. I loosed it somewhat roughly, throwing him off with a force that brought him to the ground. He rose quickly, glared at me with tiger-like ferocity, and then darted out of the room. The affair had become serious, and the same night I posted a letter to Yorkshire, informing Mr Oxley of what had occurred, and suggesting the propriety of his immediately coming to London. Measures were also taken for securing Mrs Irwin and her son from molestation.

But the cunning of lunacy is not easily baffled. On returning home the fourth evening after the dispatch of my letter, I found the house and immediate neighbourhood in the wildest confusion. My own wife was in hysterics; Mrs Irwin, I was told by half-a-dozen tongues at once, was dying; and the frightful cause of all was, that little George Irwin, a favourite with everybody, had in some unaccountable manner fallen into the river Lea, and been drowned. This, at least, was the general conviction, although the river had been dragged to no purpose—the poor child's black beaver-hat and feather having been discovered floated to the bank, a considerable way down the stream. The body, it was thought, had been carried out into the Thames by the force of the current.

A terrible suspicion glanced across my mind. 'Where is Mr Renshawe?' I asked. Nobody knew. He had not been seen since five o'clock—about the time, I soon ascertained, that the child was missed. I had the house cleared, as quickly as possible, of the numerous gossips that crowded it, and then sought a conference with Dr Garland, who was with Mrs Irwin. The distracted mother had, I found, been profusely bled and cupped, and it was hoped that brain-fever, which had been apprehended, would not ensue. The physician's suspicions pointed the same way as mine; but he declined committing himself to any advice, and I was left to act according to my own discretion. I was new to such matters at that time—unfortunately so, as it proved, or the affair might have had a less painful issue.

Tomlins and I remained up, waiting for the return of Mr Renshawe; and as the long, slow hours limped past, the night-silence only broken by the dull moaning, and occasional spasmodic screams of poor Mrs Irwin, I grew very much excited. The prolonged absence of Mr Renshawe confirmed my impressions of his guilt, and I determined to tax him with it, and take him into

custody the instant he appeared. It was two in the morning before he did so; and the nervous fumbling, for full ten minutes, with his latch-key, before he could open the door, quite prepared me for the spectral-like aspect he presented on entering. He had met somebody, it afterwards appeared, outside, who had assured him that the mother of the drowned child was either dead or dying. He never drank, I knew, but he staggered as if intoxicated; and after he had with difficulty reached the head of the stairs, in reply to my question as to where he had been, he could only stutter with white trembling lips: 'It—it—cannot be—be true—that Lau—that Mrs Irwin is—dying?'

'Quite true, Mr Renshawe,' I very imprudently replied, and in much too loud a tone, for we were but a few paces from Mrs Irwin's bedroom door. 'And if, as I suspect, the child has been drowned by you, you will have before long two murders on your head.'

A choking, bubbling noise came from the wretched man's throat, and his shaking fingers vainly strove to loosen his neck-tie. At the same moment, I heard a noise, as of struggling, in the bedroom, and the nurse's voice in eager remonstrance. I instantly made a movement towards Mr Renshawe, with a view to loosen his cravat—his features being frightfully convulsed, and to get him out of the way as quickly as possible, for I guessed what was about to happen—when he, mistaking my intention, started back, turned half round, and found himself confronted by Mrs Irwin, her pale features and white night-dress dabbled with blood, in consequence of a partial disturbance of the bandages in struggling with the nurse—a terrifying, ghastly sight even to me; to him utterly overwhelming, and scarcely needing her frenzied execrations on the murderer of her child to deprive him utterly of all remaining sense and strength. He suddenly reeled, threw his arms wildly into the air, and before I could stretch forth my hand to save him, fell heavily backwards from the edge of the steep stairs, where he was standing, to the bottom. Tomlins and I hastened to his assistance, lifted him up, and as we did so, a jet of blood gushed from his mouth; he had likewise received a terrible wound near the right temple, from which the life-stream issued copiously.

We got him to bed: Dr Garland and a neighbouring surgeon were soon with us, and prompt remedies were applied. It was a fruitless labour. Day had scarcely dawned before he heard from the physician's lips that life with him was swiftly ebbing to its close. He was perfectly conscious and collected. Happily there was no stain of murder on his soul: he had merely enticed the child away, and placed him, under an ingenious pretence, with an acquaintance at Camden-Town; and by this time both he and his mother were standing, awe-struck and weeping, by Henry Renshawe's death-bed. He had thrown the child's hat into the river, and his motive in thus acting appeared to have been a double one. In the first place, because he thought the boy's likeness to his father was the chief obstacle to Mrs Irwin's toleration of his addresses; and next, to bribe her into compliance by a promise to restore her son. But he could not be deemed accountable for his actions. 'I think,' he murmured brokenly, 'that the delusion was partly self-cherished, or of the Evil One. I observed the likeness long before, but it was not till the—' the husband was dying, that the idea fastened itself upon my aching brain, and grew there. But the world is passing: forgive me—Ellen—Laura'—He was dead!

The inquest on the cause of death returned, of course, that it was 'accidental,' but I long regretted that I had not been less precipitate, though perhaps all was for the best—for the sufferer as well as others. Mr Oxley had died some five weeks previously. This I found from Renshawe's will, where it was recited as a reason that, having no relative alive for whom he

cared, his property was bequeathed to Guy's Hospital, charged with L.100 a year to Ellen Irwin, as long as she lived unmarried. The document was perfectly coherent; and although written during the height of his monomania, contained not a word respecting the identity of the youthful widow and the Laura whose sad fate had first unsettled the testator's reason.

THE VINCEJO'S PRIZE.

[This somewhat curious incident in the under-current of history, is given on the authority of Mr H. G. Austen, of New Square, Lincoln's Inn, to whom the facts were communicated by his father, Sir F. W. Austen, who commanded one of the ships under the orders of Sir George Cockburn on the occasion referred to in the narrative.]

It is well known that when the French republican armies were overrunning the north of Italy, and commencing that wholesale system of plunder which was afterwards carried out to such perfection by Napoleon's marshals, the then reigning Duke of Florence offered the magnificent collection of pictures which adorned the Pitti Palace, to the English nation for the comparatively small sum of L.100,000—a sum which, as the late George Robins might have said, with less than his customary exaggeration, was 'hardly the price of the frames, gentlemen.' Mr Pitt seems, unfortunately, to have been less sensible of the value of the collection than scrupulous of asking parliament for the money; and the opportunity was lost of redeeming the national character, by such a set-off against the republican dispersion of the noble collection of Charles I. This circumstance is well known; but it will probably be new to most of our readers to learn, that many of the best pictures which had thus failed to become British property 'by purchase,' narrowly missed becoming such 'by conquest;' and that, in fact, they were for some hours in British custody. Such, however, was the fact, and the following narrative of the circumstance alluded to may perhaps not be considered devoid of interest.

It was in the latter part of the year 1799, that a squadron of British men-of-war was cruising in the Gulf of Genoa. It was known that the French were on the point of evacuating Italy, and these ships had been detached from Lord Keith's fleet, to watch that part of the coast, and to intercept, as far as possible, all communication between the ports of Italy and France. The squadron consisted of four vessels, under the orders of the present admiral of the fleet, Sir George Cockburn, then Captain Cockburn, whose pendant was flying in the *Minerve* frigate. Whilst some of the vessels kept pretty close in, so as to cut off all communications along-shore, others kept a look-out more to seaward, for any vessels that might attempt to make a straight run across the bay. One afternoon, four sails were discovered to seaward running towards the coast of France. The signal to chase was immediately made, and each of the British cruisers started off in pursuit of one of the strangers. Our concern is with the *Vincejo*, a brig of eighteen guns, commanded by Captain Long, which happened, from her position, to be the most advanced in the chase. She was standing off-shore on the larboard tack, with her head to the south-west, when the chase was discovered somewhat to leeward, standing nearly due west, with the wind on her starboard-quarter. The latter was a smart-looking ship of 600 or 700 tons, displaying no colours; though from the course she was steering, and her evident intention to avoid being overhauled, no doubt was entertained that she was an enemy.

Both vessels sailed well; and as the stranger gradually edged away, the *Vincejo* got more and more into her wake. A stern chase is proverbially a long chase; and though it was apparent from the first that the British, though much smaller, was the faster vessel, it was many

hours before she was enabled to get within range. About dusk, however, this was effected, and the first shot from the *Vincejo* produced an instantaneous effect on the chase: her head was thrown into the wind, and she appeared at once resigned to her fate. Great, of course, was the anxiety of the captors to learn her character, and comparatively keen the mortification which followed, when, in reply to their hail, the words 'the *Hercules* of Boston, in the United States,' were twanged across the water in unmistakable Yankee tones. Here was 'a lame and impotent conclusion.' England was at peace with the United States; and if the character of the stranger corresponded with her hail, she would prove after all no prize. The captors, however, were of course not to be put off without examination; and a boat was immediately despatched from the *Vincejo* to board, and see what could be made of her. The officer who was sent on board was received by the captain with a good deal of bluster and swagger: he loudly asserted his rights as a neutral, and threatened the vengeance of Congress if they should be infringed. His account of himself was, that he had come out from Boston with a cargo of 'notions,' which he had traded away at Leghorn; and finding some difficulty in getting a return cargo, he had agreed with some invalid French officers to take them home, and he was now bound for the first port in France he could make. This account appeared to be confirmed by his papers, and by the presence on board of several gaunt, sickly-looking figures, who had all the appearance of being military invalids. There were no visible signs of any cargo; and after a somewhat cursory examination, the lieutenant returned to his ship, after telling the skipper, more for the sake of annoyance than from any expectation of its being realised, 'that Captain Long would certainly detain him.'

This threat had the effect of determining the Yankee skipper to proceed on board the *Vincejo*, and try his eloquence on the captain; and in this expedition he was accompanied by some of his passengers. After their several natures they assailed Captain Long: the Yankee blustered and bullied; the Frenchmen were all suavity and politeness: 'They were quite sure M. le Capitaine was much too generous to take advantage of the chance which had thrown them into his hands—a few poor wounded and disabled invalids on their way home! The English were a brave people, who do not make war on invalids. What object could be gained by making them prisoners? Assuredly, M. le Capitaine would not think of detaining them.' Captain Long was sorely puzzled how to act. It must be owned, that the circumstances were suspicious. Here was a vessel just come from a port in possession of the enemy—for the French still occupied Leghorn—bound avowedly for the enemy's country, and with enemies on board. Were not these grounds enough to detain her? On the other hand, the captain's story might be true: no appearance of any cargo had been discovered; Captain Long doubted whether the presence of the Frenchmen on board would be sufficient to condemn the vessel; and there seemed something pitiful in making them prisoners under such circumstances, even if the laws of war would have sanctioned it. After some deliberation, he took a middle course, and announced that he should keep the American ship by him till daylight, when, if his senior officer should be in sight, he should take her down to him, to be dealt with as Captain Cockburn might decide: if, on the other hand, the *Minerve* should not be in sight, he would, on his own responsibility, allow the *Hercules* to proceed on her voyage. In the meantime, both vessels should return towards the point fixed on by Captain Cockburn as a rendezvous. 'And this,' he observed, 'ought to satisfy all parties, as the *Hercules* would be thereby brought nearer to her destination, which was more than her captain deserved, after the needless

chase he had led the *Vincejo*. This announcement seemed extremely unpalatable to the Yankee captain; and from a very energetic discussion which took place in under-tones between him and his passengers, it was evident they were dissuading him earnestly from some course which he was bent on taking. This was pointed out to Captain Long as an additional circumstance of suspicion, that there was something wrong about the American; and he was strongly urged to detain her, at all events, till he could get the opinion of Captain Cockburn: but he adhered to his decision. 'Ay, ay,' said he to the representations of his first-lieutenant; 'it's all very well for you, gentlemen. You share in the prize-money, but not in the responsibility of our captures; that rests upon me. And as I really think there is no ground for detaining the fellow, I'll not do more than I have said.'

Morning came; and with its first dawn many anxious eyes on board both vessels were scanning the horizon in hope or fear. The vessels had made good much of the distance they had run in the chase, and the bold cliffs of the coast between Genoa and Nice were distinctly visible from the mast-head to the north and west, but no *Minerve* greeted the searching gaze of the *Vincejo*'s look-out. The frigate was nowhere to be seen. The first-lieutenant of the *Vincejo* having communicated this fact to Captain Long, and made one more effort to prevail on him to detain the *Hercules*, till they could rejoin their senior officer, was most reluctantly compelled to give the order for communicating to the captain of that ship that she was free. The American did not wait for a second permission. Sail was made with all speed; and long before the *Vincejo* had reached her rendezvous, her late prize was safe in the harbour at Nice. When Captain Long had reported to Captain Cockburn what had taken place, the latter was by no means disposed to approve of his junior's decision. He thought the circumstance extremely suspicious, and quite sufficient to have justified the detention of the American; and not being under the influence of the gaunt aspects and energetic pleadings of the Frenchmen, he was not inclined to admit the weight of their arguments. 'I think,' said he, 'you might as well have brought her to me: I daresay I could have made something of her.' From the other captains of the squadron, too, Captain Long had to undergo much good-humoured railery for his tender-heartedness and gullibility; railery which certainly lost nothing in force, when in a few days the real nature of the adventure became known.

The French having soon afterwards abandoned Leghorn, Captain Cockburn sent one of his squadron into that port for supplies. The intelligence she brought back was truly mortifying. On the arrival of the *Theresa* at Leghorn, it appeared that the *Hercules* was the object of much interest there, and great eagerness had been displayed to learn whether anything was known of her fate. When the facts were communicated, they were received with absolute incredulity. 'Captured, examined, and let go! It was impossible. Nothing to condemn her! Why, she was loaded with booty. The plunder of Italy was on board her. Pictures, church-plate, statues, the *élite* of the spoilers' collections, had been sent off in her. She was actually ballasted with brass guns!' It was too true. Upon further inquiry, it appeared, beyond a doubt, that the vessel which had been so unfortunately dismissed as not worth detaining, had French plunder on board, which, on a moderate estimate, was valued at a million and a half sterling; and what made it still more vexatious was the discovery, that a detention of the vessel even for a few hours longer, would have led to the disclosure by the captain of the real nature of his venture. He had with difficulty been prevailed on to undertake the transport of the articles in question, and had only at last consented to do so, on an express agreement, that

if he should be detained twenty-four hours by a British cruiser, he should be at liberty to make terms for saving his vessel by denouncing the contents of his cargo. No doubt it was his intention to do this at once, against which the Frenchmen had been so earnestly remonstrating; and had Captain Long persevered in detaining him, nothing could have prevented the discovery, even if the American himself had not made the disclosure. A little ebullition of temper was to be expected when the news of what they had missed was circulated among the squadron. The captains' shares might be considered, as worth £40,000 or £50,000, a sum which it would require considerable philosophy to resign with equanimity. Whether the country could properly have benefited by the capture, may be a question for jurists. It might have been argued, that the captor of stolen goods could not be entitled to retain them against the original owner. It is probable, however, that no very nice inquiry would have been made into the title of the French possessors, and that it would have been considered a case in which, to use the language of Roderick Dhu, it was perfectly justifiable—

'To spoil the spoiler as we may,
And from the robber rend his prey.'

PAINTERS' MONOGRAMS.

ONE of the most curious among the studies of a professed connoisseur, is that of the signatures or marks, technically called 'monograms,' by which painters, sculptors, engravers, and other artists, are accustomed to distinguish their works. The dishonesty of the modern picture-market, however, has made it now little more than a curious study. As a practical guide in determining the genuineness of a work, the monogram, from the skill and precision with which fraudulent dealers have learned to counterfeit it in almost all its varieties, has long been far worse than equivocal, and the authorship of a picture must, now-a-days, often be decided on entirely independent grounds. But the history of the subject is, in many respects, extremely curious and interesting, although few have ever thought of bestowing attention upon it, except those whose actual experience as amateurs or collectors has brought it directly under their notice.

The practice of artists signing their works with their name appears to be as old as art itself. The odium excited against Phidias for his alleged impiety in inscribing his name upon the shield of his celebrated statue of Minerva, is a familiar example, which will occur to every reader; and there can be no doubt that the usage was also known to the painters of the classic times. But if we may judge from the Grecian and Roman remains, whether of sculpture, of fresco, of cameo, or of mosaic, which have come down to our times, the precaution of affixing the name was by no means universally, or even commonly adopted; and the monogram, properly so called, appears to have been entirely unknown among them.

It was so also at the first revival of art in the fourteenth and fifteenth centuries. The practice of using a single letter, or a single combination of letters or arbitrary characters, seems to have originated with the mediæval architects and other artists in stone. Neither the painters, nor the engravers, nor the metal-founders, nor the medalists of those ages, availed themselves of this device, nor do we find it at all general among such artists, till the very close of the fifteenth and the beginning of the sixteenth century. But, once introduced, it became universal. Every artist of the
